A NEW AND COMPLETE
S Y S T E M
 OF
G E O G R A P H Y.

CONTAINING

A full, accurate, authentic and interesting Account and Description
 OF
Europe, Asia, Africa, and America;

AS CONSISTING OF

CONTINENTS	SEAS	PROMONTORIES	PENINSULAS
ISLANDS	RIVERS	CAPES	ISTHMUSES
OCEANS	LAKES	BAYS	GULPHS, &c.

AND DIVIDED INTO

Empires, Kingdoms, States, and Republics.

TOGETHER WITH

Their Limits, Boundaries, Climate, Soil, Natural and Artificial Curiosities and Productions, Religion, Laws, Government, Revenues, Forces, Antiquities, &c. Also the Provinces, Cities, Towns, Villages, Forts, Castles, Harbours, Sea-ports, Aqueducts, Mountains, Mines, Minerals, Fossils, Roads, Public and Private Edifices, Universities, &c. contained in each:

And all that is interesting relative to the

Customs, Manners, Genius, Tempers, Habits, Amusements, Ceremonies, Commerce, Arts, Sciences, Manufactures, and Language of the Inhabitants. With an accurate and lively Description of the various Kinds of Birds, Beasts, Reptiles, Fishes, amphibious Creatures, Insects, &c.

INCLUDING

The Essence of the most remarkable Voyages and Travels that have been performed by the Navigators and Travellers of different Countries, particularly the late Discoveries in the South Seas, and the Voyages towards the North Pole, with every Curiosity that hath hitherto appeared in any Language respecting the different Parts of the Universe.

LIKEWISE

Many curious and interesting Circumstances concerning various Places, communicated by several Gentlemen to the Authors of this Work.

ALSO

A Concise HISTORY of every EMPIRE, KINGDOM, STATE, &c. with the various Revolutions they have undergone.

To which will be added,

A New and Easy Guide to Geography, the Use of the Globes, &c. with an Account of the Rise and Progress of Navigation, its Improvements and Utility to Mankind.

The whole embellished and enriched with upwards of One Hundred most elegant and superb Copper Plates, engraved in such a Manner as to do infinite Honour to the respective Artists by whom they are executed. These Embellishments consist of Views, Maps, Land and Water Perspectives; Birds, Beasts, Fishes, &c. as also the various Dresses of the Inhabitants of different Countries, with their strange Ceremonies, Customs, Amusements, &c. &c.

By **CHARLES THEODORE MIDDLETON, Esq.**

Assisted by several GENTLEMEN eminent for their Knowledge in the Science of Geography.

To know the World, from Home you need not stray;
 Sit at your Ease, and ev'ry Clime survey;
 Here Empires, Kingdoms, States, and Realms are shown;
 Men, Manners, Customs, Arts, and Laws made known;
 Here ev'ry Page your Wonder shall excite,
 And give Improvement, while it gives Delight.

L O N D O N :

Printed for J. COOKE, at SHAKESPEARE'S-HEAD, No. 17, in PATER-NOSTER-ROW.

MDCCCLXXVII.

NEW YORK

T H E

P R E F A C E.

IT is universally admitted, that there are few studies so replete with importance, or so abounding with entertainment, as Geography: for here the human mind, at the same time that it is pursuing pleasure, becomes enriched with a knowledge that dignifies every faculty.

The mind which applies itself to Geography, in reaping the great intellectual advantage of cultivation and improvement, enjoys doubly every pleasing description, every animating picture, every historic charm, every grace and beauty, of a variegated, interesting, and delectable science.

A knowledge of the world, and of the people who inhabit it, is a subject which more or less concerns every person. By *Nature* we are prompted to desire a knowledge of the country in which we first drew breath; *Commercial Views* lead us to enquire into the situation of our neighbours; and that *Curiosity* inherent in every human breast, and from which we derive our most sublime pleasures, induces us to wish for an acquaintance with the most remote parts of the universe in general.

One of the first objects of the human attention ought to be an investigation of such branches of knowledge as appear calculated to instruct, to enlighten, and to improve: and what, then, in this respect, can be more happily adapted than Geography? a science so effectually tending to enlarge and ripen our understandings, to correct and regulate our opinions, strengthen our associated ideas, and banish illiberal prejudices.

We mean to furnish our readers with an **AUTHENTIC UNIVERSAL SYSTEM OF GEOGRAPHY**; for which purpose we have bestowed the most elaborate pains in our researches, in order to avoid the errors which some authors have fallen into, and to give clear, distinct, and accurate descriptions: nor shall we omit an history of the present state of learning in the several countries of which we shall treat.

We have been supplied with some very valuable materials from gentlemen of established credit, who have travelled into various parts of the world, and who have investigated, with a peculiar attention, every thing worthy their curiosity: nor have we omitted to examine, with the nicest care, the writings of such great and learned men, as have explored with a philosophic precision, and have given the most just descriptions of the World.

THE PREFACE.

Our readers will not only here be made fully acquainted with the present state of empires, kingdoms, provinces, and colonies, but also with the various revolutions which have effectuated their present form and situation. We shall take a view of the ancient as well as modern world; and, by carefully describing the manners and customs of remote ages, render our undertaking the most extensively complete of any ever yet attempted.

The grand divisions of the globe into land and water, continents and islands; the situation and extent of the several kingdoms; their origin, their forms of government, their laws and revenues, their productions and natural curiosities; the genius, manners, customs, language, and learning of the inhabitants; their religion, their arts and sciences, manufactures and commerce, buildings and ruins, will be here described in the most accurate, familiar, and pleasing style.

The variegated face of nature, from the burning tropics to the frigid poles; groves, gardens, and beauteous plants; shrubberies, and each blooming flower of fair creation, cannot fail to yield the most sensible and animated pleasure; whilst, on the other hand, wild solitary prospects, rude deserts, and tremendous piles of hills, will lift the human thought to the highest extreme of equal astonishment and amusement.

The reader, desirous to investigate the transactions of remote ages, will be presented with the relics of once flourishing cities, and the splendid ruins of palaces and temples. In short, every thing that can tend to strengthen and improve the understanding, or gratify and divert the curiosity, will be found in this our historical, political, and commercial description of all the nations in the known world.

We shall begin with a description of *Asia*; for here it was, according to the holy writings, that the Divine Being created the first of the human race: it was here the beautiful garden of Eden was planted. It was Asia which, after the deluge, became the nursery of the rising generations; whence the descendants of Noah dispersed colonies into the other parts of the globe, making their first migrations into *Africa*, which will be the second object of our consideration. When the *Asiatic* and *African* regions became the seats of tyranny and despotism, some of the more liberally disposed penetrated northward; and fought for that liberty in less prolific climates, which it was no longer permitted them to enjoy in the more fertile eastern parts—Hence *Europe*, though less extensive and wealthy, became more polished and powerful than the other two parts of the world. Till at length the inhabitants made such astonishing improvements in the arts and sciences, and became so bold in the spirit of enterprise, that they discovered the fourth grand division of the globe, *America*, a part not less rich and prolific than the other three; with the history and description of which we shall conclude our arduous and useful undertaking.

Engraved for Muldrew's Complete System of Geography.

TERRESTRIAL GLOBE.

CELESTIAL GLOBE.

INTRODUCTION.

THE word Geography, which is derived from the Greek, implies a description of the *World*. By the *World* we mean the Terraqueous Globe which we inhabit, and which is usually termed the Terrestrial Globe.

Geography is the general term for the description of the Whole World; *Hydrography* implies a description of water; *Chorography* signifies the description of a country, or province; and *Topography* means the description of a particular district, city, town, village, &c.

TERMS used in GEOGRAPHY.

THE principal terms used in Geography, respecting the description of land and water, are as follow:

A *Continent* implies a large portion of earth, comprizing several countries, which are not separated by the sea.

An *Island* is a portion of earth entirely surrounded by water.

A *Peninsula* is a quantity of land, joined to the Continent by a small neck, and every where else surrounded by water.

An *Isthmus* is that neck which connects the peninsula to the main land.

A *Promontory*, or *Cape*, is a high point of land, which stretches into the sea.

An *Ocean* is an immense collection of water, surrounding a great part of the Continent.

A *Sea* is a smaller collection of water, or an inferior ocean.

A *Gulph* is a part of the sea almost surrounded by land, except at one small part, where it joins the main sea.

A *Bay* is, in general, less than a gulph, and has a wider entrance.

A *Creek* is less than a bay, and may be deemed a small inlet of water, running a little way into the land.

A *Road* is a place on the coast, where there is a good anchorage.

A *Streight*, or *Strait*, is a narrow passage of water, which joins two seas, two gulphs, a sea and a gulph, &c.

A *Lake* is a collection of waters, surrounded by land.

A *River* is a stream of water, which derives its source from some inland spring, meanders through the country, and empties itself either into the ocean, the sea, or some other river.

For the help of memory we shall recapitulate the foregoing geographical terms in verse.

A *Continent's* a *Track* of land defin'd,
Comprizing countries not by seas disjoin'd;
The wat'ry element an *Island* bounds,
And ev'ry where with circling waves furrounds;
And a *Peninsula's* an earthly space,
Which (one part only) flowing waves embrace:
That part, or neck, which joins it to the main,
By the word *Isthmus* fully we explain.
A *Promontory* is, as all agree,
A point of land projecting in the sea;
The earthy globe the furling *Oceans* bound,
And lesser *Seas* more narrow shores furround;
For an inferior sea a *Gulph* may stand,
Almost enclos'd, and circumscrib'd by land:
A *Bay* is as a smaller *Gulph* defin'd;
A *Creek's* a smaller bay, less mov'd by wind;
A *Road* is where a ship may ride with ease;
A *Streight's* a narrow pass that joins two seas;
A *Lake's* an inland sea with certain bounds,
Which banking earth on ev'ry side furrounds;
A *River* through the land meandering goes,
Streams from its source, and to the ocean flows.

Of the ARTIFICIAL SPHERE, or GLOBE.

THE Sphere is an artificial machine, consisting of many circles, invented by the sagacity of mathematicians, to explain the doctrine of the Globe, or Orrery; and to illustrate the motions of the earth, planets, &c.

Every circle is divided into 360 equal parts, which we call degrees; each degree into 60 more equal parts, called minutes.

The *Plane* of a circle means that surface on which it is drawn; and if the surface be supposed of an infinite extent from the centre, it is still called the Plane of that circle. But circles are said to be in different Planes, when the surfaces on which they are made incline to, or intersect each other.

The *Axis* is that line which we conceive to pass through the middle of the earth, and on which the whole mass turns round; represented in the Artificial Globe by a wire. The two extremities of the *Axis* are called the poles of the equator; and if the *Axis* be imagined to reach the stars, one point is called the arctic, and the other the antarctic, or the north and south poles of the world.

The principal Great Circles are these:

The *Equator* is a great circle, going from east to west, which parts the globe into the north and south hemispheres. It is named the Equator, or Equinoctial Line, because when the sun arrives there the nights and days are equal. It is also divided into 360 degrees, reckoned eastward from the first meridian.

The *Horizon* is that great circle which parts the upper hemisphere from the lower, or the visible from the invisible hemisphere. So much of the earth as we comprehend in our view, in a circular manner when we stand on a plain, is called the Sensible Horizon. It is a moveable circle, having the zenith point over the spectator's head, and the nadir point under his feet, for its two poles. But the Rational Horizon is to suppose the eye at the centre of the earth, viewing the whole celestial hemisphere upwards; which is represented by a broad wooden circle encompassing the globe, on which are described several other circles. The inner one is divided into 12 equal parts, shewing the 12 signs of the zodiac; each of which is subdivided into 30 degrees, marked 10, 20, 30. The next contains a calendar, according to the Old Style, divided into months and days; and the other is a calendar according to the New Style.

The *Meridian* is a great circle, dividing the globe into the east and west hemispheres: it lies directly north and south, passing through the poles of the equator. The Meridian is changeable, being properly that part of the heavens where the sun is at noon; so that every place on the earth has a different Meridian, if we move east or west; but passing north or south, it remains the same. The Meridians marked on the globe are 24 semicircles, ending in the poles, which we may multiply at pleasure; for Geographers usually settle one Meridian, from whence they reckon the longitude of any place, east or west; as in the new set of Maps for this Geography, London is made the first Meridian. The globe hangs in a brass circle, on which is placed another small brass one, called the horary circle: this is divided into 24 equal parts, and describes the hours of day and night; which, in turning of the globe, are pointed out by an index fitted to the pole. This is to shew the rising and setting of the sun, moon, and stars, or the time of day in all parts of the earth. The degrees of latitude are marked on any Meridian line; but in maps, always on the two outermost.

There are two other meridians called *Colures*, which being also great circles, cut the sphere into four equal parts. The Solstice Colure goes through the poles, and cuts the ecliptic at the first degree of Cancer and Capricorn: the Equinox Colure goes likewise through the poles, but cuts the ecliptic at the beginning of Aries and Libra. By these the seasons are distinguished; for when the earth, in its annual course, passes under the Equinox Colure, then commence the spring and autumn; but when it passes under the Solstice Colure, the winter and summer begin.

The *Ecliptic* is a great oblique circle, cutting the equator at angles of 23 degrees, 29 minutes. It describes the annual course of the earth, north and south: but the course of the planets and moon lies eight degrees farther on each side; which broad part of the sphere is commonly called the Zodiac, containing 16 degrees; the Ecliptic being that circle in the middle, which is divided into 12 signs, each containing 30 degrees. The characters and names of the signs are thus:

<i>Aries</i>	♈	<i>Cancer</i>	♋	<i>Libra</i>	♎	<i>Capricorn</i>	♏
<i>Taurus</i>	♉	<i>Leo</i>	♌	<i>Scorpio</i>	♏	<i>Aquarius</i>	♒
<i>Gemini</i>	♊	<i>Virgo</i>	♍	<i>Sagittarius</i>	♐	<i>Pisces</i>	♓

There are two more Great Circles, called *Verticle*, or *Azimuth Circles*. These are perpendicular to the horizon, and pass through the zenith and nadir. They are not drawn on the globe, but represented by the quadrant of altitude, which is a very thin plate of brass, made to screw on the zenith of any place, and to reach the horizon; being also divided into 90 degrees, for taking the altitude of the sun or stars, when they are not on the meridian.

The Lesser Circles are four.

The two *Tropics* are those of Cancer and Capricorn: the first is 23 degrees 29 minutes north from the equator, and the other is the same distance to the south. On all globes and maps they are known by a double line.

The

*The TERMS and PRINCIPLES of
GEOGRAPHY
With their ASTRONOMICAL CONNECTIONS*

Nominal Parts of the Earth &c.

Geographical Circles &c.

SOLAR SYSTEM

ORRERY.

The two remaining Circles are still smaller, called the *Arctic*, or *Polar Circles*. The North Pole Circle is distant 23 degrees 29 minutes from the North Pole; and the South Pole Circle is equidistant from the South Pole. These Circles have also double lines.

The Cardinal Points are the four quarters of the world, east, west, north, and south.

The Collateral Points are the principal divisions and subdivisions of the four chief; in all 32.

The earth being divided into five parts, by the two Tropics and the two Pole Circles, those five parts are named Zones. Two Temperate, two Frigid, and the Torrid Zone.

The North Temperate Zone includes all the land between the Tropic of Cancer and the North Pole Circle: and the South Temperate Zone includes all between the Tropic of Capricorn and the South Pole Circle.

The two Frigid Zones contain all the land from the two Polar Circles to the very Poles. These, by the ancients, were thought uninhabitable; but navigators have discovered many well-peopled countries within the Arctic Circle, almost round the North Pole; though none has yet been discovered within the Antarctic, or South Frigid Zone.

The Torrid Zone includes all the space between the two Tropics, the Equator being in the middle. The whole is thoroughly inhabited, though it lies under the full annual course of the sun; for which reason the ancients thought it could not be peopled for extreme heat, any more than the Frigid Zones for extreme cold.

The Temperate Zones contain in latitude each 43 degrees 2 minutes, being the space between each Tropic and the Pole Circle. The Frigid Zones contain each 46 degrees 58 minutes; that is to say, 23 degrees 29 minutes on either side the Pole: and the Torrid Zone, in like manner, contains 46 degrees 58 minutes latitude; that is, 23 degrees 29 minutes on each side the Equator.

Of S H A D O W S.

THE ancients also named the inhabitants of the earth, according to which way the Shadows of their bodies were cast by the noontide sun.

Periscii are those beyond the Polar Circles, whose bodily Shadows turn round every 24 hours.

Heteroscii are those people in the Temperate Zones, whose noon Shadows ever fall one way: the North Temperate Zone throwing it north, and the South Temperate Zone throwing it south.

Amphiscii are those who live in the Torrid, or Middle Zone. Their noon Shadows fall different ways at different seasons: for when the sun gets to the sign Cancer, being the North Tropic, their Shadows fall south; and when the sun reaches Capricorn, or the South Tropic, the Shadows go north. And because, twice a year, their bodies make no shade at all, the sun passing just over their heads, they are therefore called *Afcii*.

Periscii is from *περί*, which means round about; and *σκιά*, a Shadow. *Heteroscii* is from *ἕτερος*, meaning one only, and *σκιά*. *Amphiscii* is from *ἀμφί*, both ways. And *Afcii* is from *αἶ*, and *σκιά*; that is, without a Shadow.

Of S I T U A T I O N S.

THE *Perisci* are those who live in the same parallel, have the same latitude and seasons, and the same pole elevated; but have opposite meridians, and consequently opposite days and nights.

The *Antici* are those people who have the same meridian, but opposite parallels; equidistant from the Equator, though on contrary sides. Their longitude is the same, and consequently the same length of day and night; but they have contrary poles and seasons; and when it is noon with one, it is midnight with the other.

Antipodes are such, whose parallel and meridian are both opposite. They have the whole globe of the earth between them, in diametrical opposition; they have contrary poles elevated: their feet are directly opposite, and consequently their nights and days, winter and summer.

Of L A T I T U D E and L O N G I T U D E.

THE exact situation of cities and places, where the inhabitants of the earth reside, is more particularly called their Latitude and Longitude. Latitude is the distance of any place from each side the Equator to either of the Poles; which distance being but 90 degrees each, no Latitude can exceed that number.

Longitude is the distance of a place from the first, or some other meridian. When Ptolemy invented the way of distinguishing the situation of places, he did it by parallel and meridian lines; the latter passing round the globe through the Equator and Poles, and the former lying parallel to the Equator; which parallel lines were found very convenient for marking the Latitude into degrees and minutes. Then for Longitude, he fixed upon Teneriff, one of the Canary Islands, as the most western part of the then known world; which having a very high mountain, was a good mark for mariners, and the fittest place from whence to begin a general computation. Accordingly, all the old maps begin their East Longitude from Teneriff; and because then only one side of the globe was known, the degrees were only 180: but since the discovery of America, they are carried quite round to 360. This method was always esteemed, and Teneriff reckoned a good standard meridian, till the French, who like nothing which they themselves do not invent, thought proper to alter it, and make the Island Ferro their new meridian, which, by late observations, lies
just

just two degrees more west. Wherefore, to prevent confusion, our modern Geographers, and delineators of maps, make the metropolis of their own nation the first real meridian: and in this case Longitude is two-fold, being, from London, either west or east; as at sea it is computed from some known port, or headland.

The Longitude of any place from London being known, the difference in the hour of the day is also known. For as the sun performs his diurnal circuit in 24 hours, he gains in each hour 15 degrees, being a twenty-fourth part of 360, or one degree in four minutes. So that at any place 15 degrees east of us, noon is an hour sooner with them, as it is an hour later with those who live 15 degrees west from us. The town of Pembroke, in Wales, being five degrees west of London, their noon is therefore 20 minutes later. If a clock, or any time-piece, could be so made as to go equal and true at any season, or distance, the theory of Longitude at sea would be no more a mystery: but as that is impracticable, our modern Astronomers have contented themselves with observing the Solar and Lunar Eclipses; for if their appearances and calculations are exactly known with us, and the same appearances are observed in any other part of this globe, the difference arising from those times will settle the difference in Longitude by the foregoing rule. The Eclipses also of Jupiter's Moons, and the spheroidal figure of the Earth, two important discoveries of the seventeenth century, will each, in their turn, lead us farther on to a true system of Longitude.

Lastly, Though all degrees of Latitude are equal in length, yet degrees of Longitude vary in every new parallel of Latitude: for all the meridian lines meeting and intersecting each other at the Poles, the degrees of Longitude do naturally diminish as they proceed either way from the Equator. The best explanation of which is an orange with the peel stripped off; where the natural partitions not only resemble, but are truly the meridians of a Globe, crossing each other at the top and bottom: whereas, if the orange is cut in slices the contrary way, the divisions are parallel, and the degrees of Latitude all equal.

The following Table shews how the degrees of Longitude diminish, throughout all the parallels of Latitude; reckoning 60 parts, or miles, for a degree at the Equator.

A TABLE, shewing the Number of Miles contained in a Degree of Longitude, in each Parallel of Latitude from the Equator.

A TABLE, shewing in what Climate any Country lies, supposing the Length of the Day, and the Distance of Place from the Equator, to be known.

Ch.	Latitude. D. M.	Breadth. D. M.	Long. H. M.	Day. H. M.	Names of Countries and remarkable Places, situated in every Climate North of the Equator.
1	8 25	8 25	12 30		I. Within the first climate lie the Gold and Silver Coasts in Africa; Malacca, in the East-Indies; Cayenne and Surinam, in Terra Firma, South America.
2	16 25	8	13		II. Here lie Abyssinia, in Africa; Siam, Madrafs, and Pondicherry, in the East-Indies; Straits of Darien, between North and South America; Tobago, Granades, St. Vincent, and Barbadoes, in the West-Indies.
3	23 50	7 25	13 30		III. Contains Mecca, in Arabia; Bombay, part of Bengal, in the East-Indies; Canton, in China; Mexico, Bay of Campeachy, in North America; Jamaica, Hispaniola, St. Christophers, Antigua, Martinico, and Guadaloupe, in the West-Indies.
4	30 25	6 30	14		IV. Egypt, and the Canary Islands, in Africa; Delli, capital of the Mogul Empire, in Asia; Gulph of Mexico, and East-Florida, in North America; the Havannah, in the West-Indies.
5	36 28	6 8	14 30		V. Gibraltar, in Spain; part of the Mediterranean Sea; the Barbary Coast, in Africa; Jerusalem; Ispahan, capital of Persia; Nanking, in China; California, New-Mexico, West-Florida, Georgia, and the Carolinas, in North America.
6	41 22	4 54	15		VI. Lisbon, in Portugal; Madrid, in Spain; Minorca, Sardinia, and part of Greece, in the Mediterranean; Asia Minor, part of the Caspian Sea; Samarcand, in Great Tartary; Peking, in China; Corea and Japan; Williamburgh, in Virginia; Maryland and Philadelphia, in North America.
7	45 29	4 7	15 30		VII. Northern provinces of Spain; southern ditto of France; Turin, Genoa, and Rome, in Italy; Constantinople, and the Black Sea, in Turkey; the Caspian Sea, and part of Tartary; New-York, Boston, in New-England, North America.
8	49 01	3 32	16		VIII. Paris, Vienna, capital of Germany; New-Scotland, Newfoundland, and Canada, in North America.
9	52 00	2 57	16 30		IX. London, Flanders, Prague, Dresden; Cracow, in Poland; southern provinces of Russia; part of Tartary; north part of Newfoundland.
10	54 27	2 29	17		X. Dublin, York, Holland, Hanover, Warsaw, in Poland, Labradore, and New South Wales, in North America.
11	56 37	2 10	17 30		XI. Edinburgh, Copenhagen, Moscow, capital of Russia.
12	58 29	1 52	18		XII. South part of Sweden, Tobolski, capital of Siberia.
13	59 58	1 29	18 30		XIII. Orkney Isles, Stockholm, capital of Sweden.
14	61 18	1 20	19		XIV. Bergen, in Norway; Peterburgh, in Russia.
15	62 28	1 7	19 30		XV. Hudson's Straits, North America.
16	63 22	57	20		XVI. Siberia, and the south part of West Greenland.
17	64 06	44	20 30		XVII. Drontheim, in Norway.
18	64 49	43	21		XVIII. Part of Finland, in Russia.
19	65 21	32	21 30		XIX. Archangel, on the White Sea, Russia.
20	65 47	22	22		XX. Hecla, in Iceland.
21	66 05	19	22 30		XXI. Northern parts of Russia and Siberia.
22	66 20	14	23		XXII. New North Wales, in North America.
23	66 28	8	23 30		XXIII. Davis's Straits, in ditto.
24	66 31	3	24		XXIV. Samoieda.
25	67 21	1	Month		XXV. South part of Lapland.
26	69 48	2	Months		XXVI. West-Greenland.
27	73 37	3	Months		XXVII. Zembla Australis.
28	78 30	4	Months		XXVIII. Zembla Borealis.
29	84 05	5	Months		XXIX. Spitzbergen, or East-Greenland.

INTRODUCTION.

The SOLAR SYSTEM.*

TO explain the disposition of the several parts of the universe, and demonstrate the nature of the heavenly motions with respect to each other, and to the earth, it is necessary to understand the *System of the World*.

Several *Systems* have, at various times, been formed chiefly from conjecture; but the astonishing improvements in astronomy made in later ages, have exploded erroneous suppositions; and experience, assisted by experiment, have at length fixed on a permanent basis, the only true System, called the *Solar System*.

This admirable System was invented by Copernicus, a Prussian, and afterwards fully demonstrated and explained by the incomparable Sir Isaac Newton, who clearly elucidated the harmony of the universe,

"Where order in variety we see,
"And where, tho' all things differ, all agree."

This System consists of the Sun in the centre, and the Planets and Comets moving about it.

The Planets are vast bodies, which to us appear like stars; not that they have any light in themselves, but shine merely by reflecting the light of the sun.

"Each Planet shining in his proper sphere,
"Does, with just speed, his radiant voyage steer;
"Each fees his lamp with different lustre crown'd,
"Each knows his course with different periods bound;
"And in his passage through the liquid space,
"Nor hastens, nor retards his neighbours race.
"Now shine these Planets with substantial rays,
"Does innate lustre gild their measur'd days?
"No; but they do as is by system shewn,
"Dart furtive beams, and glory, not their own,
"All servants to that source of light, the Sun."

}

The Planets are either *Primary*, or *Secondary*.
The Primary Planets are six in number, viz.

Mercury,		Earth,		Jupiter,
Venus,		Mars,		Saturn.

These are called Primary Planets, because they move round the Sun; and the other Planets are called Secondary, because they move round the Primary Planets.

The Secondary Planets are ten in number, and go under the general name of *Moons*: of these *one* moves round the *Earth*, *four* round *Jupiter*, and *five* round *Saturn*.

With respect to *Comets* it is universally agreed, that they are immense bodies, revolving about the sun in elliptical orbits. Their periodical times are equally constant, certain, and regular, as those of the Planets; but the bodies themselves are abundantly more dense, as they pass through greater extremes of heat and cold, without any sensible diminution.

All Comets are Spheres, with large atmospheres surrounding them. These, in their nearness to the sun, by the intense heat emitted therefrom, are so much rarified, as to be abundantly lighter than the sun's atmosphere, and extended into long lucid tails, towards those parts opposite the sun. As Comets recede from the sun, their tails diminish, and their atmospheres encrease gradually until they approach the greatest distance from the sun, and then their tails are contracted into circumambient atmospheres. With regard to motion, Comets and Planets have this difference: all Planets move from east to west in the plane of the ecliptic, and in orbits nearly circular; but Comets, in their very elliptical orbits, traverse the compass in all directions (the plane of the ecliptic excepted), and that in a manner so wonderful, as not to interfere in the orbits of each other. Superstition long held them as ominous, and the vulgar supposed they were certain fore-runners of some tremendous event.

"Thus terribly in air the Comets roll,
"And shoot malignant gleams from pole to pole;
"Tween worlds and worlds they move, and from their air
"Shake the blue plague, the pestilence, and war."

* Though the Newtonian System seems to differ, in some respects, from the account of the Creation by Moses, yet both are true, and the variation is only in point of expression. Moses alludes to the rotation of the sun round its own axis, which some have mistaken for a motion round the earth. But it should be recollected, that Moses had an ignorant and stiff-necked people to deal with; in consequence of which he talked as a *Moralist*, not as a *Philosopher*, and wished to make them *good*, not *learned*; he therefore sacrificed mathematical distinctions to the more immediate duties of his function as a religious Law-giver.

I N T R O D U C T I O N.

xi

S U N.

THE Sun, situated in the centre of the universe, is the fountain of light, the source of the seasons, the cause of the vicissitudes of day and night, the parent of vegetation, and the friend of man. It is a prodigious body of intense heat, and amazing illumination: in fine, when we view the Sun we behold a globe of liquid fire, whose diameter is equal to 100 diameters of the earth; the thickness being 793,000 miles. Its surface is 10,000 times larger than the earth, and its solidity 1,000,000 greater: that is, the surface is the square of the thickness, and the solidity its cube.

"The Sun that rolls his beamy orbs on high,
 "Pride of the world, and glory of the sky,
 "Illustrious in his course, in bright array
 "Marches along the heav'n's, and scatters day
 "O'er earth, and o'er the main, and the ethereal way.
 "He in the morn renews his radiant round,
 "And warms the fragrant bosom of the ground;
 "But e're the noon of day, in fiery gleams
 "He darts the glory of his blazing beams;
 "Beneath the burnings of his fultry ray,
 "Earth to her center pierc'd, admits the day."

M E R C U R Y.

THE Planet Mercury is about two-thirds of the earth's magnitude, being 2700 miles in diameter. His distance from the earth is 88,000,000 of miles, and from the sun 32,000,000 of miles. His revolution round the sun is made in a little more than 88 days, with the velocity of 100,000 miles in an hour, which is almost as swift again as the earth travels; for we only go 56,000 miles in the same space. The heat of the sun in this Planet is something more than seven times greater than the heat of the hottest part of the earth in the most sultry summer, which is sufficient to make water boil.

"Mercury, nearest to the central Sun,
 "Does, in his oval orbit, circling run;
 "But seldom is the object of our sight,
 "In solar glory sunk, and more prevailing light."

V E N U S.

THE Planet Venus appears to the eye to be the brightest of all the Planets; and from its superior lustre it cannot be mistaken for any of them. The distance of Venus from the sun is 60,000,000 of miles; her revolution round the sun is performed in a little more than 224 days, and her motion in an hour is 70,000 miles. From the uncommon brightness of this Planet, the poets have made it the Goddess of Beauty.

— "She turn'd, and made appear
 "Her neck refulgent, and dishevell'd hair;
 "Which flowing on her shoulders reach'd the ground,
 "And widely spread ambrosial scents around;
 "In length of train descends her sweeping gown,
 "And, by her graceful walk, the Queen of Love is known."

E A R T H.

THE Earth forms its revolution round the sun in 365 days 5 hours and 49 minutes, which revolution makes what we term a year. The Earth is near 80,000 miles in diameter, and distant from the sun about 81,000,000 of miles. The line which this Planet describes in its annual motion is called the Ecliptic, through which it proceeds from west to east, according to the signs of the Zodiac; and it is this motion which causes the different seasons of spring, summer, autumn, and winter, and of the various lengths of days and nights in those seasons.

The Earth, in passing through the ecliptic, always keeps its axis in a situation parallel to itself, and equally inclined to the plane of the ecliptic, which is 23 degrees and a half.

The rotation of the Earth round its own axis makes it day in those parts which are turned towards the sun, and night in those parts which are turned from the sun.

While the bright radiant sun in centre glows,
 The earth, in annual motion, round it goes;
 At the same time on its own axis reels,
 And gives us change of seasons as it wheels;
 Hence stars we see in various order bright,
 Hence we are blest with change of day and night.

M A R S.

M A R S.

MARS is situated next above the earth in the system of the universe, his course being in the interval between the orbit of Jupiter and that of the Earth, but very distant from both. It is the least of all the Planets, Mercury excepted; has less lustre than any other star, and appears of a dusky red hue. Mars is considerably less than the Earth, its diameter being only 4400 miles. His distance from the sun is 123,000,000 of miles, and he revolves about that central luminary in 687 days, proceeding at the rate of 45,000 miles in an hour. From the sanguinary appearance of this Planet, the ancient poets, in their fables, deemed it the God of War.

" Thus on the banks of Hebrus freezing flood,
 " The God of Battles in his angry mood,
 " Clashing his sword against his brazen shield,
 " Lets loose the reins, and scours along the field.
 " Before the wind his fiery couriers fly,
 " Groans the sad earth, resounds the rattling sky;
 " *Wrath, Terror, Treason, Tumult, and Despair,*
 " Dire faces, and deform'd, furround the car,
 " Friends of the God, and followers of the war."

J U P I T E R.

JUPITER is the largest of all the Planets, but being very remote from the Sun, would scarce enjoy any light, had not the great Author of Nature provided it with four moons, or satellites, which revolve round it in different orbits.

The diameter of Jupiter is upwards of 80,000 miles, and the mass of matter it contains 220 times greater than our Earth. The distance from the sun is 424,000,000 of miles; he revolves round his own axis in 9 hours and 56 minutes; round the sun in 11 years and 10 months, and proceeds at the rate of 24,000 miles an hour.

Exclusive of a famous spot by which the diurnal motion of this Planet was originally determined, it has swatches, or belts round it, that are moveable, and which are formed by clouds; and, like the trade winds to us, lie in tracks parallel to the equator. The poets feigned this Planet to be the head of the heathen Deities, or fabulous Gods, and represented him as having the command of the thunderbolts.

" The pow'r immense, 'eternal energy,
 " The king of Gods and men, whose awful hand
 " Disperes thunder on the seas and land,
 " Disposing all with absolute command."

S A T U R N.

SATURN is the most distant Planet in the whole System, being 779,000,000 of miles from the sun. He is 30 years in performing his revolution, and yet moves at the rate of 18,000 miles an hour. He is 61,000 miles in diameter, contains 94 times as much matter as the Earth; but his density is not more than a seventh part of the matter which composes our Planet.

As the light and heat in Saturn are not above a ninetieth part of what we enjoy from the sun, the wife Creator of the Universe hath accommodated Saturn with five moons, which revolve round him in different orbs. But the most singular circumstance relative to this Planet is his ring. This is a vast body of earth, of the thickness of near 800 miles, which furrounds Saturn in form of a circle, at the distance of 21,000 miles from its surface.

S E C O N D A R Y P L A N E T S.

THE Secondary Planets, as we have already observed, are ten in number, viz. five belonging to Saturn, four to Jupiter, and one to our Earth.

With respect to nine of these Moons, or Satellites, namely, those belonging to Saturn and Jupiter, they were unknown till the last century, by reason of their being so diminutive, that they could not be seen from our Earth without the use of long telescopes; hence, till those optical glasses were improved, these Secondary Planets were unobserved.

The Moon which lights our Earth, contains about the fortieth part of the quantity, or mass of matter, which compose the Planet we reside upon. It is near 2200 miles in diameter, 240,000 miles distant from us; and its surface is about 14,000,000 of square miles.

The Moon is the quickest in its motion of all the Planets, making its revolution in 27 days seven hours and three quarters. The light which this Planet affords us at night is not the only benefit we receive from it; for it governs the waters, and occasions the tides, which are of infinite benefit to mankind.

“ The Moon, as day-light fades,
 “ Lifts her broad circle in the deep’ning shades;
 “ Array’d in glory, and enthron’d in light,
 “ She breaks the solemn terrors of the night;
 “ Sweetly inconstant in her varying flame,
 “ She changes still, another, yet the same:
 “ Now in decrease, by slow degrees she shrouds
 “ Her fading lustres in a vale of clouds:
 “ Now at encrease, her gath’ring beams display
 “ A blaze of light, and give a paler day.
 “ Ten thousand stars adorn her glittering train,
 “ Fall when she falls, and rise with her again;
 “ And o’er the deserts of the sky unfold,
 “ Their burning spangles of Sidereal gold;
 “ Thro’ the wide heav’ns she moves serenely bright;
 “ Queen of the gay attendants of the night;
 “ Orb above orb, in sweet confusion lies,
 “ And with a bright disorder paints the skies.”

F I X E D S T A R S .

THE difference, with regard to vision, between the fixed Stars and Planets is, that the latter have a more placid lustre than the former. The fixed Stars have the source of light within themselves, being Suns; but the Planets are composed of opaque matter, and have no light but what they receive from the Sun, or their own Satellites. Hence, though the fixed Stars are at an immense distance, their brightness exceeds that of the Planets, and they are to be distinguished by their twinkling, though Venus and Mercury both twinkle, but not in so great a degree as the fixed Stars.

Beyond the atmosphere of our System the heavens are filled with a fluid much more rarified than our air; and here the fixed Stars are placed at different, but immense distances from us, and very great distances from each other. “ We must have a vast idea of this space, (says an accurate writer) when we consider that the largest of the fixed Stars, which are probably the nearest to us, are at a distance too great for the expression of all that we can conceive from figures, and for all means of admeasurement. The smallest are, doubtless, more and more remote to the least, which are of the sixth magnitude. These must be in a part of the heavens more remote from us than the others, and yet beyond these telescopes discover to us more Stars too distant to be at all perceptible to the naked eye; and in proportion to the power of these instruments, more or less we discover.” Hence we may obtain some idea of the infinite wisdom and power of the Great Creator of the Universe.

“ Who spread the pure Cerulean fields on high,
 “ And arch’d the chambers of the vaulted sky;
 “ Which he to suit their glory with their height,
 “ Adorn’d with globes that reel, as drunk, with light;
 “ His hand directed all the timeless spheres,
 “ He turn’d their orbs, and polish’d all the Stars.”

Of the C L I M A T E S .

THERE are 24 Climates on each side the equator; and under the equator the longest day is no more than twelve hours; and in proportion as we advance towards the Polar Circles, the days encrease in every Climate half an hour; and at the Polar Circles, the longest day is 24 hours. To know what Climate any city, town, or village is in, observe the longest day, from which deduct 12, and multiply the remainder by two, when the product will be the number of the Climate.

E X A M P L E .		Hours,
The longest day in London is	—	16
From which deduct		12
		—
		4
Multiply the remainder by		2
		—
The product is the Climate of London	—	8

Like seasons, climes must differ ev’ry where,
 But man is fitted ev’ry clime to bear.

Of the COMPASS.

IN the Compass there are four Cardinal Points, viz. East, West, North, and South. Between these four grand points many intermediate points are formed; but these, for the purposes of Geography and Navigation, are confined to 32. As all these respect the position of places, we find by them how empires, kingdoms, states, provinces, districts, &c. are situated with regard to each other; that is, whether they lie northerly, southerly, easterly, or westerly, or agreeable to any of the inferior or intermediate points.

The invention of the Mariner's Compass has been, perhaps, of as great and general utility as any discovery that ever benefited mankind, as by its means the wants of one country are accommodated with the superfluities of another; the welfare of individuals, situated at a great distance, becomes interesting to each other; and the inhabitants of the whole universe are linked in one great society.

While the touch'd Needle trembles to the Pole,
The sailor steers wherever waves can roll;
Lost to the sight of earth, and light of day,
Thro' boundless oceans he explores his way;
On the true Compass all his hopes depend,
His faithful guide, and his directing friend.

The Number of Miles to a Degree of Latitude in other Nations, in Proportion to ours of Sixty-nine.

Statute British miles	—	—	—	69
Italian miles, each 475 Rhinland perch, [according to Varenus]	—	—	—	60
Common Turkish miles ditto	—	—	—	60
Spanish miles	—	—	—	17
Marine leagues of France, (ours the same)	—	—	—	20
German leagues	—	—	—	15
Low Dutch travelling hours	—	—	—	20
Great leagues of Poland and Denmark	—	—	—	15
Swedish miles	—	—	—	12
Hungarian miles	—	—	—	10
Versts of Moscow	—	—	—	80
Persian, Arabian, and Egyptian parfanga	—	—	—	20
Chinese leis	—	—	—	250

The French measure is to ours as 15 to 16. Therefore 4950 Paris feet are equal to 5280 British, being our statute mile.

Of MAPS.

IN all Maps the north is at top, the south at bottom; the east on the right, and the west on the left: or, if it be otherwise, it is always expressed either by words on each side, or by a Mariner's Compass, wherein the mark of a Fleur-de-lys always denotes the north.

Maps are laid down and proportioned to a certain scale, which is always taken from the degrees of Latitude.

The degrees of Latitude are always marked on the east and west side of the Map.

The degrees of Longitude are always marked on the north and south side of the Map.

A degree of Latitude is always of the same breadth: wherefore the distance of two places seated directly north and south, is immediately known by knowing the different Latitudes. But a degree of Longitude is of different extent.

The Latitude and Longitude of a place being known, you may find it immediately in the Map, by drawing a line, or thread, cross the Map both ways; and where the two lines cut one another, the place stands.

The Earth being a Globe, a Map of the whole Earth must necessarily consist of two parts, both sides of the Globe not being visible at once. Accordingly, in a universal Map, the right hand circle shews the Old World, or Europe, Asia, and Africa; and the left hand circle shews the New World, or America.

Upon the general Map are marked the Circles correspondent to those in the Sphere, namely, the Equinoctial Line, the two Tropics, and the two Polar Circles, all which cross the Map from east to west; and the first Meridians surrounding the two Hemispheres from north to south, the Parallels lying from north to south at ten degrees distance; and the Meridians at the same distance from west to east, are also marked upon general Maps.

Particular Maps, being parts of this, retain the Meridians and Parallels belonging to that particular part; which are made smaller or larger, as the paper on which it is drawn will admit; and the distance of places mentioned in it are always exactly proportioned to the breadth of the Parallels. So that let a Map be ever so small, the distance of places is exactly shewn, if measured according to the degrees of Latitude in that particular Map.

In both general and particular Maps, the thick shadowing denotes the Sea-coast. Rivers are marked by large shadowed serpentine lines; Roads by double lines; divisions of Countries by dotted lines; larger for Provinces, and smaller for Subdivisions; and divisions of Nations are often shewn by chain lines. Forests are represented by trees; Mountains by rising shadows; Sands by dotted Beds; Marshes by shadowed beds; Lakes by shadowed coasts.

The names of Provinces are written in larger capitals; and smaller Divisions, in smaller capitals; great Cities in round Roman characters; smaller Towns in *Italic*.

The exact situation of a Town is shewn by a little round o, but larger places have the addition of a church for a Market-Town, if the size of the Map will admit. A City is noted by a church with houses about it, as much as the scale will allow. Particular qualifications of Cities are distinguished by marks, as a Bishopric has a cross, or sometimes a mitre over it.

An Archbishopric has a double cross over it.

A University has a star, or sometimes a *Caduceus*.

An Abbey is shewn by a crook, or pastoral staff.

A Fortress, by angles like bastions.

A Castle, by a little flag.

A Gentleman's Seat, by a house only.

Other marks are affected by particular engravers, which they explain in the margin.

Of the E A R T H, abstractedly considered.

THE first thing that presents itself to our view is that huge, massy substance, the Globe of the Earth, consisting of many solid materials, as well as great quantities of salt and fresh water; for which reason the philosophers commonly call it the Terraqueous Globe. And though the solid matter may perhaps be more than the fluid, yet the water takes up much the greater part of the surface of the Globe, as is plain to any one who looks upon a Map of the Earth: for beside the rivers and lakes, pools and fountains, which water the Earth in various places, the ocean, and its particular seas, are much more extended than the dry land; which doubtless was ordered by the Maker of all Things, for the good of mankind, there being such great occasion for water to moisten the Earth, supply us with fish, and facilitate commerce and navigation.

But referring to another place what we shall say about the waters, if we consider the Earth properly so called, we shall find it to be a heap of various bodies; for therein are discovered sand, clay, mould of various colours, several sorts of stones, many salts, sulphur, bitumen, minerals, and metals, without number. Nor is it necessary to dig to the centre of the earth, whither human industry can never penetrate, for the discovery of these things; they are sometimes met with in great abundance, not many feet deep. But in the mines of Hungary and Peru, which are said to be deeper than ordinary, great store of such things appear.

The ancient philosophers (and schoolmen, who followed their opinion, and maintained that the Earth is one of those four Elements whereof all things consist) observing such a medley of things to lie under the surface of the Earth, said this was not the pure Element they meant, but that it was somewhere about the centre: but since no man can ever come at those parts near the centre of the Earth, this conjecture of theirs is useless.

If Des Cartes's hypotheses were but well grounded, that the Planets were once of the like nature with the fixed stars, consisting of a fiery substance, and came afterwards to be crusted over with thick and solid matter, there might be still, at this day, a great fire in the centre of the Earth, as some people imagine. But since the grounds on which he supposed the Planets to be derived, may be reckoned among those things which are every way doubtful, and only seem not impossible, though perhaps as far from being true as real impossibilities; it is a rashness in his followers to take this imaginary fire at the centre of the Earth for a certain truth.

If those parts which now make up the Earth were once loose, and carried round the same centre in a circular motion, we could then gather, from most certain experiments, that the grossest of all the parts fell down to the centre of the Earth. Now, since we know nothing heavier than metals, it would not be absurd to suppose, that the inmost bowels of the Earth were filled with a prodigious store of various metals: and this being presumed, our opinion would receive confirmation from magnetic experiments, by which it generally appears, that the Earth is of the nature of a great loadstone. Therefore we might, with great reason suspect, that at the heart of the Earth there are iron and loadstone in great abundance, which would be just contrary to their opinion who hold a fiery centre. But this our hypothesis is built upon no certain reason, and therefore, for the avoiding of error, it is much the safest way to suspend our assent in this case.

However, this is observable, that the deeper we dig into the ground, the heavier the matter is; and though there be no coming near the centre of the Earth, yet such metals are dug out of the deepest mines, as are rarely found on the surface; and if, instead of digging mines a mile and a half deep, which is hardly ever done, we could go some miles downward, perhaps the matter would still be closer and heavier.

But be this as it will, thus much we are sure of, as to the parts about the surface of the Earth, that they are under a continual change and alteration, which may proceed from various causes. Among those causes we will not reckon human labours: but this we see, that the hardest bodies in the world, the very adamant itself not excepted, being exposed to the open air, do wear and waste in time, and undergo various alterations without the hand of man; and, therefore, the whole surface of the Earth, whereon the air perpetually presses, must needs be subject to such alterations.

Beside

Beside the perpetual change of the seasons, heat and cold, rain and wind, earthquakes and running waters, are always making a wonderful change in that part of the Earth which is next the surface: and if we take in the daily mutations of innumerable animals and plants, which are fed by the fruits and moisture of the Earth, and after a short time putrify, and return to Earth again, we shall have reason to believe, that this surface on which we tread, especially in countries that have been long inhabited, is, for the most part, composed of the bodies of men and beasts, or rather of a matter which is every day putting on new forms.

And by such perpetual variations of matter, there must needs happen an increase of dry Earth, and a decay of moisture; for it does not appear, that the parts of fluid bodies, which have been once blended with solids, and have been so impregnated with salts as to lose their fluidity, do ever retrieve it again. This is evident in plants and animals, which grow bigger so long as they receive spirit and nourishment from liquors, but afterwards turn to corruption. Some conclude from hence, that in order to prevent too great a decay, or total failure of moisture in the Planets, God created Comets; that so their fumes diffusing themselves through the vortex of the Sun, might fall into the lesser vortices of the Planets, and augment their liquids.

Moreover, there must needs be a vast change made in the Earth by means of the many fires which prey upon it within.

Philosophers sometimes consider the Earth as a huge loadstone, which, when we come to speak of the loadstone, we shall have opportunity to enlarge upon. Meanwhile we may here observe, that in this respect also the Earth is much altered, as appears from the variations of the Magnetic Needle, which sometimes points directly at the Pole, and sometimes declines several degrees east or west. But this cannot happen, without an alteration in the pores of that magnetic matter which flows out of the Earth, and which seems to come at one time directly from the Pole, and at another time from those parts which are on the right or left side of the Pole. And whether this variation proceeds from the fires under ground, which may spoil here and there a mine of loadstone, (yet so as that it may afterwards recover its virtue again) or whether it be from some other cause, is what no man certainly knows.

G E O G R A P H I C A L P R O B L E M S.

P R O B L E M I.

The Latitude of any Place being given, to rectify the Globe for that Place.

LET it be required to rectify the Globe for the Latitude of London, 51 deg. 32 min. north; and Madrid 40 deg. 10 min. north, proceed thus:

Turn the Pole on which the dial-plate is fixed towards the verge of the Horizon, slipping or moving the Globe backwards or forwards in the notches of the Horizon, till the Horizon cuts the brazen Meridian in 51 deg. 32 min. (viz. a little more than 51 and a half); so is the Globe rectified for the Latitude of London; that is, the North Pole will then be elevated 51 deg. 32 min. above the Horizon; and London being brought to the Meridian itself, will then be in Zenith, or right up, and at equal distance from all parts of the Horizon.

Depress the Pole till the Horizon cuts the brazen Meridian at 40 deg. 10 min. and you have then the position of the inhabitants at Madrid; and turning the Globe till Madrid comes to the Meridian, you will find it in the Zenith, or top of the Globe, under 40 deg. 10 min.

Note. If it were required to rectify the Globe for South Latitude, then you must elevate the South Pole to the given Latitude, instead of the North Pole; but this is better explained by the next Problem.

P R O B L E M II.

The Latitude and Longitude of any Place given, to find the same.

First. You are to observe whether the Longitude be reckoned from London, or from the first Meridian; for on some Globes the first Meridian begins 23 deg. on others 20 deg. and on Senex's Globes 18 deg. west of London; but if once you know where the first Meridian is on the Globe, it is very easy to know the difference from the Meridian of London.

E X A M P L E.

There are two certain places; one has 18 deg. North Latitude, and 77 deg. 5 min. West Longitude; the other is 33 deg. 45 min. South Latitude, and 18 deg. East Longitude from London. I demand what Places these are.

Rule. For the first Place, I elevate to the North Pole 18 deg. because it is 18 deg. North Latitude: then I turn the Globe to the right hand, or eastward, (because the place lies westward) till 77 deg. 5 min. upon the Equator, counted from the Meridian of London, (which on Senex's Globe has a cypher thus (0) on the Equator) passes through, or under the Meridian: or, in other words, I turn the Globe till 77 deg. 5 min. westward be brought under the Meridian, and here I fix the Globe with a quill thrust in betwixt the Globe and the Horizon; then I look under the Latitude 18 deg. (which is in the Zenith) on the Meridian a-top of the Globe, and under 18 deg. on the Meridian I find Port-Royal, in Jamaica, the place required.

For

For the second Place I elevate the South Pole (though there is no occasion to elevate the Pole barely to find a place, but it is better, because you have then the real situation of the inhabitants) to the given Latitude 34 deg. 45 min. and then turn the Globe till 18 deg. East Longitude of London come under the Meridian; and just under this I find the Cape of Good Hope, the place required.

P R O B L E M III.

The Latitude of any Place given, to tell all those Places that have the same Latitude.

D E F I N I T I O N.

All those places that have the same Latitude have the days and nights of the same length, at the same time of the year.

Rule. Bring the given place, or places, to the Meridian (suppose London 51 deg. 32 min. and Madrid 40 deg. 10 min. North); then turn the Globe, and all those places that pass under 50 deg. 32 min. have the same Latitude as London, viz. Prague, in Germany, &c. and all that pass under 40 deg. 10 min. have the same Latitude as Madrid, which you will find to be Pekin nearly for one, and many other places.

P R O B L E M IV.

To tell the Difference of the Latitude of Places.

Here are two Variations, or Rules.

First. If the Latitudes be both North or both South, then subtract the less from the greater Latitude, and the remainder is the difference, or answer. Thus between London and Madrid is 12 deg. 32 min. the first being 50 deg. 32 min. and the other 40 deg. And between Candy and Stockholm is 52 deg. 30 min. for Stockholm is about 59 deg. 30 min. North, and Candy 7 deg. 30 min. North.

Secondly. If one lies on the North, and the other on the South-side of the Equator, (that is to say, if one be North and the other South Latitude) then add them both together, and their sum is the difference of the Latitude required.

Thus Copenhagen is 55 deg. 40 min. North, and the Island of Madagascar is 19 deg. 30 min. South: these added together make 75 deg. 10 min. the difference of Latitude required.

P R O B L E M V.

The Longitude of any Place given from any Meridian, to tell those Places, having the same Longitude.

This is done after the same manner as the other; only here the answer will be on the Equator, as the others were on the Meridian.

I would know what places have the same Longitude as London, and the same Longitude as Moscow?

The Rule is, bring London to the Meridian, then all those places on the Globe (from the North Pole to the South part of the Horizon) that lie under the edge of the Meridian, have the same Longitude as London: thus Fort Nassau, and Fort Mina, in Guinea, have the same, or very nearly the same Longitude as London.

And Moscow, in Muscovy, has very nearly the same Longitude as Aleppo, in Syria: also Scanderoon, Antioch, and Tripoli, in Syria, have the same Longitude, viz. 37 deg. 30 min. from London.

P R O B L E M VI.

To tell the Difference of Longitude of Places.

Rule. Here are two Variations.

First. If the places lie both East or both West of the first Meridian, or where you reckon the Longitude from, viz. if they both be East, or both be West Longitude, then subtract one from the other, you have the difference.

Thus I find Jerusalem has 36 deg. 15 min. East Longitude from London, and Pekin 110 deg. 52 min. East Longitude; therefore subtract 36 deg. 15 min. from 110 deg. 52 min. and there remains 74 deg. 37 min. difference of Longitude East or West; that is, Pekin is 74 deg. 37 min. East Longitude of Jerusalem, or Jerusalem is 74 deg. 37 min. West Longitude of Pekin.

Secondly. If one place be East, and the other West Longitude of the first Meridian, (suppose London, or any other Meridian) then add their Longitudes together, and the sum is the difference of Longitude required.

E X A M P L E I.

I would know the difference of the Longitude between Jerusalem, 36 deg. 15 min. East of London, and Port Royal, in Jamaica, 77 deg. 5 min. West?

Here, as one is East, and the other West, I add 36 deg. 15 min. and 77 deg. 5 min. together, and their sum makes 113 deg. 20 min. difference of Longitude; that is, Jerusalem is 113 deg. 20 min. East of Port-Royal, or Port-Royal is 113 deg. 20 min. West of Jerusalem.

E X A M P L E II.

Pekin, in China, is 110 deg. 15 min. East Longitude, and Port-Royal 77 deg. 5 min. West; I add these sums together, and find it 187 deg. 57 min. difference of Longitude; but because it is more than 180 deg. I subtract 187 deg. 15 min. from 360 deg. and there remains 172 deg. 3 min. the difference required.

P R O B L E M VII.

The Day of the Month given to find the Sun's Place in the Ecliptic.

Rule. The day of the month being given, look on the inner Calendar on the new Globes, and you have the sign, and the degree of that sign that the Sun is in for that day, according to the New Style.

If it be upon old Globes, look on the outer Calendar, you have the sign, and degree of the sign.

N. B. You may further observe, that the Calendar used throughout Europe is the Calendar for New Style, viz. New Style is always known from the other, because it has the Saints Days, and several other things, wrote on the Horizon.

E X A M P L E.

I would know the Sun's place in the Ecliptic on May 21, New Style; March 21, June 21, September 22, and December 21.

I look for these days of the months in order as they stand in the new Calendar, (viz. for New Style before described) and right against the day of the month in the innermost Circle on the Horizon, I find the Sun's place among the signs, as follows:

Thus right against May 21 I find 1 deg. of Gemini: and also on March 21 I find he enters Aries: on June 21 he enters Cancer: on September 22 he enters Libra: and on December 21 he enters Capricorn.

P R O B L E M VIII.

The Sun's Place given, to find the Day of the Month.

This is only the reverse of the former Problem: for having the Sun's place given, seek it in the Circle among the signs; then against that degree in the Calendar New Style you have the day of the month required.

E X A M P L E.

I would know what time of the year the Sun is in 1 deg. of Gemini: as also when he enters Aries, Cancer, Libra, and Capricorn? Proceed according to the rule, and you will find the day to be May the 21st, June the 21st, September the 22d, and December the 21st, as in the last.

P R O B L E M IX.

The Latitude and Day of the Month given, to find the Sun's Place in the Ecliptic, and rectify the Globes for use.

Rule. Find the Sun's place on the Horizon by Problem the Seventh; and having noted what degree he is in, look upon the Ecliptic on the Globe, and find the same sign and degree as you did on the Horizon; then bring this degree of the Ecliptic very carefully to the graduate edge of the brazen Meridian, and holding the Globe steady, turn the Index exactly to the upper twelve (which represents twelve at noon); and thus is the Globe rectified for that day, and the degree of the Ecliptic that lies under the Equator represents the Sun's place at noon, or twelve o'clock that day.

v. The Astronomer's day is reckoned from, or begins at, twelve o'clock; and if you fix the Quadrant of Altitude to the Latitude in the Zenith, the Globe will be completely rectified.

P R O B L E M X.

To tell the Declination of the Sun on any Day of the Year.

Rule. Having found the Sun's place in the Ecliptic for the given day, bring it to the brazen Meridian, and observe what degree of the Meridian it lies under; and whether it be on the North
or

I N T R O D U C T I O N. xix

or on the South-side of the Equator, for that is the declination required, which is called North or South declination accordingly. Thus, on April the 21st, the Sun has 11 deg. 30 min. North declination; and on May the 21st, he has 20 deg. 30 min. declination; but on October the 27th, he has 12 deg. 30 min. South declination.

P R O B L E M XI.

The Latitude and Day of the Month given to tell the Sun's Meridian Altitude, viz. his Height at Noon.

Rule. Bring the Sun's place to the Meridian, and observe what degree of the Meridian the Sun's place is under; for those degrees on the Meridian that are intercepted, or lie between the South Verge of the Horizon and the Degree, which is over the Sun's place on the Meridian, (counted on the Meridian) is the Sun's Meridian Altitude required.

Thus I find his Meridian Altitude at London, May the 21st, to be 59 deg. but on November the 5th, he has but 23 deg. 30 min. Altitude.

P R O B L E M XII.

The Latitude and Day of the Month given, to tell the Sun's Altitude at any Time.

Example. On May the 21st, at nine in the morning, and at five in the afternoon, at London, I would know the Sun's altitude, or height?

Rule. Rectify the Globe for the Latitude, and bring the Sun's place (1 deg. Gemini) to the Meridian, and the Index to the upper twelve on the Dial-plate; then screw the Quadrant of altitude on the Zenith, (viz. the left edge of the Nut must be fixed on the Meridian, at 51 deg. 30 min. then turn the Globe till the Index points to the hour, viz. nine in the morning: this done, fix the Globe by thrusting a quill between it and the Horizon: lastly, turn the Quadrant about till the graduated or figured edge touch the Sun's place, (viz. 1 deg. Gemini) and the degrees on the Quadrant, counted from the Horizon upwards on the Quadrant, is his height at that time, viz. 43 deg. 30 min. Then turn the Globe till the Index points at five in the afternoon; and also turn the Quadrant on the West-side (without unscrewing it) till it touches the Sun's place, and you have about 24 deg. on the Quadrant, his altitude at that time.

N. B. At North Cape, (viz. North Latitude, 72 deg. at nine in the morning) May the 21st, he will be but about 32 deg. high.

P R O B L E M XIII.

The Latitude given, to tell the Rising and Setting of the Sun, and Length of the Day and Night, at any Time of the Year in any Place.

Rule. Rectify the Globe, (viz. elevate it for the Latitude; bring the Sun's place to the Meridian, and Index to the upper twelve); then turn it till the Sun's place comes even with, or lies right against the inner Verge, on the East-side of the Horizon, then the Index will shew you the time of the Sun's rising; turn it to the West-side, or Verge of the Horizon, and the Index will shew you the setting. Or thus; having got the hour the sun rises, count how many it wants of twelve, for so many hours will it set after. Thus, if the Index points to four in the morning at rising, it will of course be at eight at night, &c.

Proceed thus, and you will find the Sun, on May the 26th, at London, to rise about four in the morning, and sets at eight at night. Now double what he wants of twelve at rising, viz. eight hours, and it gives the length of that day at London, viz. sixteen hours.

P R O B L E M XIV.

To tell the Sun's right Ascension.

Bring the Sun's place to the brazen Meridian, and note what degree of the Equator is cut by the Meridian, for that is his right Ascension required.

I would know the Sun's right Ascension on March the 21st, June the 21st, September the 22d, and December the 21st?

I find the Sun's place for these different days, and bring it to the Meridian; I find the Meridian cuts the Equator in (0), in (90), in (180), and in (270 deg.) his right Ascension requires.

Note. When the Sun enters Aries, March the 21st, he has no right Ascension, because it is counted from, or begins at Aries; therefore, on March the 20th, he must have his greatest right Ascension, viz. 359 deg.

P R O B L E M

P R O B L E M XV.

To find the Sun's oblique Ascension and Descension at any Time, and in any Latitude.

Rule. Rectify the Globe for the Latitude, and bring the Sun's place down to the eastern verge of the Horizon; then observe what degree the Horizon cuts the Equator in, for that is the oblique Ascension required.

Thus, on March the 21st, June the 21st, September the 22d, and December the 21st, viz. when the Sun enters Aries, Cancer, Libra, and Capricorn, you will find his oblique Ascension at London to be (o), (56), (180), and (304).

And on the same days his oblique Descension will be (o), (123), (180), and (237 and a half.)

P R O B L E M XVI.

The Latitude and Day of the Month given, to tell the Sun's ascensional Difference, viz. how much he rises, or sets, before and after Six; and consequently to tell the Length of the Days, suppose there were no Index to the Globe.

Rk1e. By the last Problem find the Sun's right, and oblique ascension; then subtract the oblique from the right ascension, or the contrary, and the remainder is the ascensional difference required; which divide by fifteen, the degrees of the Equator that pass through the Meridian of one hour, (or seven and a half for half an hour) gives the answer in time, that the Sun rises and sets before and after six.

Thus, on May the 26th, I find the Sun 6 deg. of Gemini, and his right ascension is 64 deg. and, on the same day, his oblique ascension is 34 deg. now 34 deg. from 64 deg. there remains 30 deg. his ascensional difference; which divide by 15 gives two hours, the time that he rises before, or sets after six.

P R O B L E M XVII.

The Latitude and Day of the Month given, to tell the Sun's Amplitude, viz. his Distance from the East and West Points of the Compass he rises and sets upon.

Rule. The Globe being rectified, bring the Sun's place to the eastern verge of the Horizon, (which shews his rising) then the degree upon the innermost Circle of the Horizon, counted from the true East Point to the place where the Sun's place lies against on the Horizon, shews you the Sun's amplitude.

Proceed according to the rule, you will find the Sun's amplitude at London (May the 21st) at rising, to be about 34 deg. from the East to the North, and at setting 34 deg. from the West to the North; and the Point he rises upon is North-East by East, and he sets North-West by West; but on November the 5th he has about 25 deg. and a half amplitude from the East to the South, and at setting 25 deg. and a half from the West to the South. The Point he rises upon is East-South-East, and the Point he sets upon is West-South-West.

P R O B L E M XVIII.

The Latitude and Day given, to tell the Sun's Azimuth, viz. his Distance from the East and West, or from the North and South Points, at any Time.

Rule. Rectify the Globe in general, then turn the Globe till the Index points to the given hour: this being done, turn the Quadrant till it touches the Sun's place for the given day; and then the Quadrant will cut the Horizon in the Azimuth required, from the East or West Points, or from the North or South Points; for you may reckon from either, only then name it properly, and accordingly.

Thus, on August the 17th, at nine in the morning, the Sun will have about 30 deg. Azimuth from the East to the South, or which is the same, 60 deg. from South to the East; for 60 deg. and 30 deg. make 90 deg. the whole quarter from East to South.

P R O B L E M XIX.

The Latitude, Day, and Hour given, to tell the Sun's Almicanter.

D E F I N I T I O N.

Almicanters are Circles of Altitude, that run parallel to the Horizon, whose Poles are the Zenith and Nadir; so that you may imagine as many Circles of Altitude, viz. Almicanter, as you please.

Rule.

I N T R O D U C T I O N.

xxi

Rule. The Almicanter is found the same as the Altitude of the Sun at any time, therefore I refer you back to Problem 13.

P R O B L E M XX.

The Latitude and Length of the Day given, to tell what other Day of the Year will be of the same Length.

Rule. Having found the Sun's place for the given day, bring it to the Meridian, and observe well its declination; then turn the Globe till some other degree of the Ecliptic comes under the same degree of declination under the Meridian; this being done, see what day of the month answers to the Sun's place then under the Meridian, for that is the day required; which you may easily prove. Thus you will find July the 13th, and August the 20th, of the same length as May the 26th, and April the 17th.

P R O B L E M XXI.

The Latitude and Day given, to tell the Beginning, Ending, and (consequently) the Length, or Continuance of Twilight.

D E F I N I T I O N.

Twilight is that faint light which begins immediately after the Sun sets in the evening, till he is 18 deg. below the Horizon; and it begins in the morning, when the Sun comes within 18 deg. of the Horizon on the East-side, and ends when he rises. Therefore it is plain, that Twilight is not only longer when days encrease in length, but it is also much stronger, as will be seen by the work of the Problem.

O B S E R V A T I O N.

Note. You were told that Twilight begins and ends when the Sun is 18 deg. below the Horizon; and as the Quadrant of Altitude reaches no lower than the Horizon, therefore the rule is this:

Rectify the Globe, and bring the opposite degree of the Sun's place to the Quadrant of Altitude, so that it touches just 18 deg. on the Quadrant (then it is plain that the Sun's real place will be depressed 18 deg. below the Horizon); then look at the Index, for that will point (if among the morning hours) to the beginning, or (if among the evening hours) ending of Twilight.

Proceed then according to the rule, and you will find that on March the 21st, and September the 22d, Twilight begins about four in the morning, and ends about eight at night.

The Sun on these days you know rises and sets at six. Add, therefore, the length of morning and evening Twilight to twelve hours, (the length of the day then) and it gives sixteen hours; this, subtracted from twenty-four hours, leaves eight hours the length of the real, or dark night.

So also on April the 24th, Twilight begins about half past two, ends about half past nine, which is in all seven hours. But on December the 20th it begins at six, and ends at six, which is in all but three hours and forty minutes.

P R O B L E M XXII.

The Hour given where you are to tell what Hour it is in any other Part of the World.

Rule. Bring the given place to the Meridian, and set the Index at the given hour; then turn the Globe till the other place, or places, come under the Meridian, and the Index will point to the real time in the place required.

Example. When it is two o'clock in the afternoon at London, I would know the time at Jerusalem, and at Port-Royal, in Jamaica?

Proceed according to the rule, and you will find that when it is two in the afternoon at London, it is twenty-five minutes past four at Jerusalem; and but fifty-two minutes past eight in the morning at Port Royal.

Or thus, by Problem the Sixth, Jerusalem is 36 deg. 15 min. East Longitude of London; I divide, therefore, 36 deg. 15 min. by fifteen, and the Quotient is two hours, and the remainder is six, which is six times, or twenty-four minutes, and the odd fifteen minutes, or miles, in one minute; so that the difference is two hours twenty-five minutes, and as Jerusalem is East of London, it has its hour before us; therefore it is twenty-five minutes after four in the afternoon. And thus for other places.

P R O.

P R O B L E M XXIII.

The Day of the Month given, to tell those Inhabitants that will have the Sun in their Zenith (or over their Heads) on that Day.

O B S E R V A T I O N .

This cannot happen to any other inhabitants but those in the Torrid Zones; that is, to all such as have not above 23 deg. and a half of Latitude, either North or South.

Rule. Bring the Sun's place to the Meridian, and observe exactly his declination for that day; then turn the Globe any way, and observe what places pass under that degree of declination on the Meridian; for all such will have the Sun right over their heads, some time or other on that day.

I would know what inhabitants, or places, will have the Sun in their Zenith on May the 21st?

Proceed as directed by the rule, you will find St. Jago, in Hispaniola; St. Jago, in Cuba; Campeachy, and many other places, will pass under that degree of declination, viz. (20 deg. North) and will have the Sun in their Zenith that day.

Also, on April the 16th, the inhabitants of Porto-Bello, the Oroonoko-Islands, Bay of Siam, Isle of Ceylon, and the Philippine-Islands, will have the Sun in, or near their Zenith, on that day.

P R O B L E M XXIV.

The Day and Hour given in any Place to tell those Inhabitants, or that Place, to which the Sun is then vertical, viz. in the Zenith.

Rule. Bring the given place to the brazen Meridian, and turn the Index to the given hour; this done, turn the Globe till the Index points to the upper 12, or noon; then look under the degree of declination on the Globe of that day, for that is the very spot, or place, to which the Sun is then vertical.

Example. On May the 13th, at eight minutes past five in the afternoon at London, I would know what place has the Sun in their Zenith? Answer, Port-Royal, in Jamaica.

Thus also you will find, when it is thirty-three minutes past six in the morning at London, on April the 12th, and August the 28th, the inhabitants of Candy, in the Island of Ceylon, will have the Sun then nearly in their Zenith.

Of the M A G N E T, or L O A D S T O N E .

WE shall not enquire when the Loadstone was first known; our present business being only to give the Natural History of it. First then, we will observe its various properties which experience has made known; and, in the next place, propose the opinions of philosophers, concerning its internal nature and disposition.

The Loadstone is found in iron-mines, and is much of a colour and weight with iron. However, it is not to be melted and hammered out like iron, but flies to pieces under the hammer, and turns to a Calx in the fire; which shews, that its parts exceed those of iron for hardness, rigidity, and an intricate combination one with another. This is worth observing, because it will be of use in the following discourse:

Its known properties are these: First, when it moves freely, and without any obstacle, it points North and South, so as that part of it which stands to one Pole never turns to the other. The way to give it a free motion, is to swim it in the water upon a piece of wood.

Philosophers have observed, that the Loadstone does not always point full North and South; but sometimes inclines to the East or West, without any rule.

Two Loadstones, placed at a certain distance from each other, do mutually approach or recede, according to their various positions. Their parts which stand North being opposed, go off to a distance from each other; but the South-end of the one draws to the North-end of the other; and so *vice versa*. These parts of the Loadstones we call their Poles; and for a reason which will appear hereafter, we shall call that the South-Pole which turns to the North, and that the North-Pole which points to the South.

Two Loadstones will hold up one another in the air by turns, if the North-Pole of the one be put to the South-Pole of the other; and *vice versa*. Sometimes a lighter Loadstone will hold up a heavier, when the heavier will not hold up a lighter.

It is observable, that all Loadstones are not equally brisk and nimble in turning to the Poles of the World; nor is their attracting virtue all alike.

Though a Loadstone generally has two Poles pointing North and South, as we said before; yet there are some irregular ones, which seem to have more Poles.

As one Loadstone holds up another, so it does iron of greater or less weight than itself.

If iron-dust be strewed upon a Loadstone, the particles will dispose themselves directly between the Poles, and then by degrees incline to an orbicular figure, so as to lie parallel with the axis of the Loadstone, unless it be one of the irregular sorts before mentioned.

The

The Loadstone imparts its virtue to iron so effectually, that iron, touched with a Loadstone, appears to have all the properties aforesaid, though not in an equal degree. The great use of this communication is experienced in the Mariner's Needle, by the help whereof they readily find the North and South, and all other parts of the world.

It is observable, that on this side the Equator, the North-Point of the Needle is more depressed than that which stands to the South; on the further side the North-Point is elevated, and the South depressed; but under the line it keeps no situation, nor is of any use.

As the Loadstone communicates its virtue to iron; so when it is set in iron, it attracts a greater weight of it than it does by itself.

Loadstones are spoiled if they lie long near one another, with the North or South-Pole of the one opposed to the same Pole of the other; or if they are thoroughly heated in the fire, which likewise spoils the magnetic virtue in iron; and this virtue is much impaired in iron by its rust, to which the Loadstone is not so liable.

Lastly, iron placed at length North and South, and continuing so for a long time without alteration, has often acquired a magnetic virtue; as the old crosses upon churches are found to do.

Of the S E A.

AFTER fountains and rivers, it is now proper to view the common receptacle of them all, the Sea, which is that vast quantity of salt-water extending from North to South, and from West to East, surrounding the dry land on every side, into which all streams discharge themselves, and out of which mighty gulphs and bays are formed, the greatest of which is the Mediterranean. The whole is, in one word, called the Ocean, but variously distinguished and named, from the several countries by whose coasts it runs. In it there are these three properties chiefly considered by Naturalists: First, its inseparable saltness; Secondly, its constant equality of bulk, notwithstanding the incessant flowing of all rivers into it; and Thirdly, the tide, or flowing and ebbing of its waters twice every day: all which properties we shall consider.

The saltness of the Sea-water seems to proceed from the same cause as that of several fountains, by the boiling of which water salt is produced: for since the bottom of the Sea is of such vast extent, it is reasonable to think that there are large mines of salt in many places of it, which being diluted, spread throughout the Sea. And there is something even in the river-water, which helps to increase this saltness; for the rivers carry down with them an incredible multitude of saline particles, which they wash off their banks as they run along. These particles are not indeed so considerable as to salt their particular streams; but when they all meet together, and settle in one bottom, they may well be allowed to change the taste of the water sufficiently.

Hence we may likewise be satisfied why the saltness of the Sea is neither augmented nor diminished, at least not in a sensible manner. It is not augmented by the influx of salt particles. 1. Because a world of saline particles are continually thrown off upon the shore, where they putrify, and come no more into the water. 2. Because people make salt upon the Sea-coast for common uses. 3. Water can be impregnated with salt only to a certain degree, at which it stands and rejects the overplus. 4. In the last place, the saltness of the Sea is not diminished, because as much is imported or diluted from its own mines, as is got out of it.

To help us in finding out the reason why the water of the Sea is not augmented, let us see whether there be not a way for its daily diminution, as well as increase. It is sufficiently plain that there is a vast quantity of vapours in the air, from the abundance of snow and rain, which are formed of condensed vapours: but how to estimate the quantity of the evaporations of water by some certain rule, is the material point; which the learned Dr. Halley has happily attempted in the following manner:

He took a pan of water about four inches deep, and about eight inches diameter, salted to the same degree as is the common Sea-water, by the solution of about a fortieth part of salt, in which he placed a thermometer, and by means of a pan of coals he brought the water to the same degree of heat, which is observed to be that of our air in the hottest summer, the thermometer nicely shewing it. This done, he affixed the pan of water, with the thermometer in it, to one end of the beam of a pair of scales, and exactly counterpoised it with weights in the other scale; and by the application or removal of the pan of coals, he found it very easy to maintain the water in the same degree of heat precisely. Doing this, he found the weight of the water sensibly to decrease; and, at the end of two hours, he observed that there wanted near half an ounce troy, or 233 grains of water, which, in that time, had gone off in vapour, though he could hardly perceive it smoke, and the water not sensibly warm. This quantity, in so short a time, seemed very considerable, being little less than six ounces in 24 hours, from so small a surface as a circle of eight inches diameter.

To reduce this experiment to an exact Calculus, and determine the thickness of the skin of water that had so evaporated, he assumes the experiment alledged by Dr. Bernard to have been made in the Oxford Society, that the cube foot English of water weighs exactly 76 pounds troy; this divided by 1728, the number of inches in a cube foot, will give 253 one-eighth grains, or half ounce 13 one-third grains for the weight of a cube inch of water: wherefore the weight of 233 grains is about 35 parts of 38 of a cube inch of water, and shows that the thickness of the water evaporated was the 57d part of an inch, but we will suppose it only the 50th part, for the facility of calculation.

If, therefore, water as warm as the air in summer, exhales the thicknes of a 50th part of an inch in two hours from its whole surface, in 12 hours it will exhale the one-tenth of an inch; which quantity will be found abundantly sufficient to serve for all the rains, springs, and dews; and account for the Caspian Sea being always at a stand, neither waisting nor overflowing; as likewise for the current said to set always in at the Straits of Gibraltar, though those Mediterranean Seas receive so many, and such considerable rivers.

To estimate the quantity of water arising in vapours out of the Sea, he thinks he ought to consider it only for the time the sun is up, for that the dews all night return as much, if not more vapours than are exhaled; and in summer the days being longer than 12 hours, this excess is balanced by the weaker action of the sun, especially when rising before the water be warmed: so that if we allow one-tenth of an inch of the surface of the Sea to be raised every day in vapour, it may not be an improbable conjecture.

Upon this supposition, every 10 square inches of the surface of the water yields in vapour daily a cube inch of water; and each square foot half a wine pint; every space of four feet square, a gallon; a mile square, 6914 tons; a square degree, suppose of 69 English miles, will evaporate 33 millions of tons.

And if the Mediterranean be estimated at 40 degrees long, and four broad, allowances being made for the inequalities, there will be 160 square degrees of Sea; and, consequently, the whole Mediterranean must lose in vapour in a summer's day, at least 5280 millions of tons. And this quantity of vapour, though very great, is as little as can be concluded from the experiment produced. And yet there remains another cause, which cannot be reduced to rule, namely, the Winds, whereby the surface of the water is skimmed off sometimes faster than by the heat of the sun.

Of W I N D S.

IT is well known that Wind is nothing else but the stream of the air, together with such vapours as the air carries along with it. But there are a great many properties of Winds, the reasons and grounds of which are not easily discovered. However, we will first consider the Winds in general, as they are constant or variable. Secondly, we will particularly examine their various appearances; and Lastly, say something of their origin.

The Winds may be divided into constant and variable: the former are always, at certain times of the year, and in certain parts of the world; but the latter vary so much, that they cannot be reduced to any rule. Now since it is easier to find out the cause of one regular effect, than of many irregular, let us, in the first place, treat of constant winds. And here we must take notice, that the Winds are constant and periodical only in the open seas. Now the universal Ocean may most properly be divided into three parts. 1. The Atlantic and Ethiopic Ocean. 2. The Indian Ocean. 3. The great South-Sea, or Pacific Ocean; and though these seas do all communicate by the south, yet as to our present purpose of the Periodical Winds, they are sufficiently separated by the interposition of great tracts of land; the first lying between Africa and America; the second between Africa and India; and the last between China, Japan, and the coast of America.

In the Atlantic and Ethiopic Seas between the Tropics, there is a general easterly Wind all the year, excepting that it is subject to vary and deflect some few points towards the north or south, according to the position of the place. The observations which have been made of these deflections are as follow: that near the coast of Africa, as soon as you pass the Canary Isles, you are sure to meet a fresh gale of north-east Wind, about the latitude of 28 degrees north, which seldom comes to the eastward of east-north-east, or passes the north-north-east. This wind accompanies those bound to the southward, to the latitude of ten north, and about 100 leagues from the Guinea Coast, where, till the fourth degree of north latitude, they fall into calms and tornadoes.

Those who are bound to the Caribbe Isles find, as they approach the American side, that the aforesaid north-east wind becomes still more and more easterly, so as sometimes to be east, sometimes east by south, but yet most commonly to the northward of the east, a point or two, not more. It is likewise observed, that the strength of these Winds gradually decreases as you sail westward.

The limits of the constant and variable Winds in this ocean are farther extended on the American side than the African: for whereas you meet not with this certain Wind till you have passed the latitude of 28 degrees on this side; on the American side it commonly holds to 30, 31, or 32 degrees of latitude: and this is verified likewise to the southward of the Equator: for near the Cape of Good Hope the limits of the Trade Winds are three or four degrees nearer the line, than on the coast of Brazil.

From the latitude of four degrees north, to the aforesaid limits on the south of the Equator, the Winds are perpetually between the south and east, and most commonly between the south-east and east; observing always this rule, that on the African side they are more southerly, on the Brazilian more easterly, so as to become almost due east, the little deflection they have being still to the south. In this part of the ocean the Wind has been nicely observed, for a full year together, to keep constantly about the south-east, the most usual point south-east by east. When it is easterly it generally blows hard, with gloomy, dark, and sometimes rainy weather.

The season of the year has some small effect on these constant winds; for when the sun is to the north of the Equator, the south-east Winds, especially between Brazil and the coast of Guinea, vary a point or two to the south, and the north-east become more easterly; and, on the contrary, when the

the sun is towards the Tropic of Capricorn, the south-easterly Winds become more easterly; and the north-easterly Winds, on this side the line, vere more northward.

As there is no rule without some exception, so there is in this ocean a tract of sea, wherein the southerly and south-west Winds are perpetual, and that is all along the coast of Guinea, for above 500 leagues together, from Sierra Leona to the life of St. Thomas; for the south-east Trade Wind having passed the line, and approaching the coast of Guinea within 80 or 100 leagues, inclines towards the shore, and becomes south-south-east; and by degrees, as you come nearer, it veres about to south, south-south-west, and in with the land south-west, and sometimes west-south-west, as is seen in the map of the Trade Winds.

To the northward of the line, between four and ten degrees of latitude, and between the Meridians of Cape Verd, and of the easternmost islands that bear that name, there is a tract of sea, wherein it were improper to say there is any Trade Wind, or yet any variable; for it seems condemned to perpetual calms, attended with terrible thunder and lightning, and rains so frequent, that our navigators from thence call this part of the sea *The Rains*: the little Winds that are, consist only of some sudden uncertain gusts, of very little continuance, and less extent.

All who use the West-India trade, even those bound to Virginia, count it their best course to get as soon as they can to the southward, that they may be sure of a fair fresh gale to run before it to the westward; and for the same reason, those homeward bound from America endeavour to gain the latitude of 30 degrees as soon as possible, where they first find the Winds to be variable, though the most ordinary Winds in the north part of the Atlantic Ocean come from between the south and west.

What is here said is to be understood of the Sea Winds at some distance from land; for upon and near shore, the land and sea-breezes are almost every where sensible; and the great variety which happens in their periods, force, and direction, from the situation of the mountains, vallies, and woods, and from the various texture of the soil, more or less capable of retaining and reflecting heat, and of exhaling or condensing vapours, is such, that it were endless to endeavour to account for them.

In the Indian Ocean the Winds are partly general, as in the Ethiopic Ocean partly periodical; that is, half the year they blow one way, and the other half near upon the opposite points; and these points, and times of shifting, are different in different parts of this Ocean; the limits of each tract of sea, subject to the same change, or monsoon, (as the natives call it) are certainly very hard to determine; but the diligence I have used (says Dr. Halley) to be rightly informed, and the care I have taken therein, has, in a great measure, surmounted that difficulty; and I am persuaded, that the following particulars may be relied on:

That between the latitudes of 10 and 30 degrees south, between Madagascar and New-Holland, the general Trade Wind about the south-east by east is found to blow all the year long, to all intents and purposes, after the same manner as in the same latitudes in the Ethiopic Ocean.

The aforesaid south-east Winds extend to within two degrees of the Equator, during the months of June, July, and to November; at which time, between the south latitude of three and 10 degrees, being near the Meridian of the north-end of Madagascar, and between two and 12 south latitude, being near Sumatra and Java, the contrary winds from the north-west, or between the north and west, set in and blow for half the year; that is, from the beginning of December till May; and this monsoon is observed as far as the Molucca Isles.

To the northward of three degrees south latitude, over the whole Arabian or Indian Sea, and Gulph of Bengal, from Sumatra to the coast of Africa, there is another monsoon blowing from October to April upon the north-east points; but in the other half year, from April to October, upon the opposite points of south-west and west-south-west, and that with rather more force than the other, accompanied with dark rainy weather; whereas the north-east blows clear. And the Winds are not so constant, either in strength or point, in the Gulph of Bengal, as they are in the Indian Sea, where a certain and steady gale scarce ever fails. It is also remarkable, that the south-west Winds in these seas are generally more southerly on the African side, and more westerly on the Indian.

To the eastward of Sumatra and Malacca, to the northward of the line, and along the coast of Camboya and China, the monsoons blow north and south; that is to say, the north-east Winds are much northerly, and the south-west much southerly. This constitution reaches to the eastward of the Philippine Isles, and as far north as Japan; the northern monsoon setting in here in October or November, and the southern in May, blowing all the summer months. The points of the compass, from whence the Wind comes in these parts of the world, are not so fixed as in those lately described; for the southerly will often pass a point or two to the eastward of the south, and the northerly as much to the westward of the north, which seems occasioned by the great quantity of land which is interpersed in these seas.

In the same Meridians, but southward of the Equator, being that tract lying between Sumatra and Java to the west, and New-Guinea to the east, the same northerly monsoons are observed; but with this difference, that the inclination of the northerly is towards the north-west, and of the southerly towards the south-east.

These contrary Winds do not shift all at once, but in some places the time of the change is attended with calms, in others with variable Winds; and it is particularly remarkable, that the end of the westerly monsoon, on the coast of Coromandel, and the two last months of the southerly monsoon in the seas of China, are very subject to be tempestuous: the violence of these storms is such, that they seem to be of the nature of the West-Indian hurricanes, and render the navigation of these parts very unsafe about that time of the year. These tempests are by our seamen usually termed, *The breaking up of the Monsoons*.

By reason of the shifting of these Winds, all those that sail in these seas are obliged to observe the seasons proper for their voyages; and by so doing, they sail not of a fair Wind, and speedy passage; but if they chance to outstay their time till the contrary monsoon sets in, as it frequently happens, they are forced to give over the hopes of accomplishing their intended voyage, and put into some other harbour, there to remain till the Winds come favourable.

The third Ocean, called the Great Pacific, whose extent is equal to that of the other two, (it being from the west coast of America to the Philippine Islands, not less than 150 degrees of longitude) is that which is least known to all nations. The chief navigation is by the Spaniards, who go yearly from New-Spain to the Manillas by one beaten track; so that we cannot be particular here, as in the other two. What the Spanish authors say of the Winds they find in their courses, and what is confirmed by the old accounts of Drake and Cavendish, and since by Schooten, is, that there is a great conformity between the Winds of this sea, and those of the Atlantic and Ethiopic; that to the northward of the Equator the predominant Wind is between the east and north-east, and to the southward thereof there is a constant steady gale between the east and south-east, and that on both sides the line with so much constancy, that they scarce ever need to attend the sails; and so much strength, that it is rare to fail of crossing this vast Ocean in 10 weeks time, which is about 150 British miles a day.

This is to be understood of the Pacific Sea at a great distance from land; for about the shores are various Winds; and when the south-east or south-west blows, this sea is rough and dangerous, for the least Wind raises it very high; but when the Wind ceases, though it blowed very strong just before, there is an immediate calm, as if there had been no Wind for a long time; whereas, on the contrary, the Atlantic Sea rolls for several days after the Wind is laid, and is generally smooth on the coast, and tempestuous out on the main.

The limits also of these general Winds are much the same as in the Atlantic Sea, that is, about the thirtieth degree of latitude on both sides; for the Spaniards, home-bound from Manilla, always take the advantage of the south monsoon, blowing there in the summer months, and run up to the north of that latitude as high as Japan, before they meet with variable Winds to shape their course eastward. Also Schooten and others, who have gone by the Magellan Straits, have found the limits of the south-east Winds much about the same latitude to the southward: and a farther analogy between the Winds of this Ocean and the Ethiopic, appears in that upon the coast of Peru; they are always much southerly, as they are near the shores of Angola.

As for the Variable Winds, they are felt most by land, and in such parts of the sea as are without the limits of the constant Winds to the north and south; that is, in the colder parts of the Ocean, and all over its outmost bays, the principal of which are the Mediterranean and Baltic: some are common to all countries; others are more peculiar to some particular parts. Of this latter sort the most famous are the hurricanes, which chiefly infect the Caribbees, but are not anniverſary, nor equally frequent. Their fury is so great, that they throw down all before them, tear up trees, overturn houses, toss ships prodigiously, and blow about things of vast weight. They are not even, but blow in gusts, which suddenly come and go; neither do they extend very wide, but are sometimes confined to a narrow compass, and at other times take a larger scope. As for their duration it is but for a few days, and sometimes only a few hours. They are more common in America than any where, though Europe and Asia are not altogether without them.

It may be observed of all Winds, whether constant or variable, that some are drying, others are moist; some gather clouds, others disperse them; some are warm, others cold. But their influence is not one and the same in all places; for such Winds as are cold and dry in one country, are warm and wet in another.

These are the principal observations concerning Winds; for to examine every thing belonging to this subject would be the work of a large volume, as no reasons can be given for several things, before the truth of them is better ascertained. Wherefore we shall, at present, confine ourselves to account for the causes of constant Winds.

Wind is most properly defined to be the stream, or current of the air; and where such a current is perpetual, and fixed in its course, it is necessary that it proceeds from a permanent, unintermitting cause. Wherefore some have been inclined to propole the diurnal rotation of the earth upon the axis, by which, as the Globe turns east, the loose and fluid particles of the air, being so exceeding light, are left behind; so that in respect of the earth's surface, they move westward, and become a constant easterly Wind. This opinion seems confirmed, for that these Winds are found only near the Equinoctial, in those parallels of latitude where the diurnal motion is swiftest. And we should readily assent to it, if the constant calms in the Atlantic Sea near the Equator, the westerly Winds near the coast of Guinea, and the periodical westerly monsoons under the Equator in the Indian Seas, did not declare the insufficiency of that hypothesis. Besides, the air being kept to the earth by the principle of gravity, would require the same degree of velocity that the surface of the earth moves with, as well in respect of the diurnal rotation, as of the annual about the sun, which is 30 times faster.

It remains therefore to find some other cause, capable of producing a like constant effect, agreeable to the known properties of the elements of air and water, and the laws of the motion of fluid bodies. Such a one is, we conceive, the action of the sun-beams upon the air and water, as he passes every day over the Oceans, considered together with the nature of the soil, and situation of the adjoining continents: therefore First, according to the laws of statics, the air which is less rarified, or expanded by heat, and consequently more ponderous, must have a motion towards those parts thereof, which are more rarified and less ponderous, to bring it to an equilibrium: and Secondly, the presence of the sun continually shifting to the westward, that part toward which the air tends, by reason of the rarefaction made by his great meridian heat, is with him carried westward,

westward, and consequently the tendency of the whole body of the lower air is that way. Thus a general easterly wind is formed, which being impressed upon all the air of a vast Ocean, the parts impel one another, and so keep moving till the next return of the sun, whereby so much of the motion as was lost is again restored; and thus the westerly wind is made perpetual.

From the same principle it follows, that the easterly Wind should, on the north side of the Equator, be to the northward of the east, and in south latitudes, to the southward thereof; for near the line the air is much more rarified than at a greater distance from it, because of the sun being twice in a year vertical, and at no time distant above 23 degrees and a half; at which distance the heat, being as the sine of the angle of incidence, is but little short of that of the perpendicular ray. Whereas under the Tropics, though the sun continues long vertical, yet he is as long 47 degrees off; which is a kind of winter, wherein the air so cools, as that the summer heat cannot warm it to the same degree with that under the Equator: wherefore the air to the northward and southward being less rarified than that in the middle, it follows, that from both sides it ought to tend toward the Equator: this motion, compounded with the former easterly Wind, answers all the phenomena of the general Trade Winds; which, if the whole were sea, would undoubtedly blow all round the world, as they are found to do in the Atlantic and Ethiopic Oceans.

But seeing that so great continents do interpose and break the continuity of the Oceans, regard must be had to the nature of the soil, and the position of the high mountains; which may be supposed the two principal causes of the several variations of the winds from the former general rule: for if a country lying near the sun proves to be flat, sandy, low land, such as the deserts of Libya are usually reported to be, the heat occasioned by the reflexion of the sun-beams, and the retention thereof in the sand, is incredible to those who have not felt it, whereby the air being exceedingly rarified, it is necessary that the cooler and more dense air should run thitherwards to restore the equilibrium: this is most likely to be the cause, why near the coast of Guinea the Wind always sets in upon the land, blowing westerly instead of easterly.

There is sufficient reason to believe that the inland parts of Africa are prodigious hot, since the northern borders thereof were so intemperate, as to give the ancients cause to conclude, that all beyond the Tropic was uninhabitable by excess of heat. From the same cause it happens, that there are such constant calms in that part of the Ocean, called the Rains; for this tract being placed in the middle, between the westerly Winds blowing on the coast of Guinea; and the easterly Trade Winds blowing to the west thereof, the tendency of the air here is indifferent to either; and so stands in equilibrio between both; and the weight of the incumbent atmosphere being diminished by the continual contrary Winds blowing from hence, is the reason that the air here holds not the copious vapour it receives, but lets it fall into frequent rains.

But as the cool and dense air, by reason of its greater gravity, presses upon the hot and rarified, it is demonstrative, that this latter must ascend in a continued stream as fast as it rarifies; and that being ascended, it must disperse itself to preserve the equilibrium, that is, the upper air must move by a contrary current from those parts where the greatest heat is: so, by a kind of circulation, the north-east Trade Wind below will be attended with a south-westerly above, and the south-easterly with a north-west Wind above: that this is more than a bare conjecture, the almost instantaneous change of the Wind to the opposite point, which is frequently found in passing the limits of the Trade Winds, seems to assure us; but that which above all confirms this hypothesis, is the phenomenon of the monsoons, by this means most easily solved, and without it hardly explicable.

If the causes of tempests and hurricanes be demanded, they are hardly to be accounted for in all particulars. However, it may in the first place be noted, that the ratio of all liquids is much the same, and therefore an extraordinary motion may be excited in the air, by the same way as it is in the water. Now if water falls from a high place, or if there be a confluence of several streams together, this gives it a violent motion, and causes many whirlings and eddies in it: this is apparent in the torrents falling down from rocks, and the confluences of rivers. If, therefore, something analogous to this may happen in the air, there must needs be furious tempests of Wind raised in it. And such a thing may happen, if an extraordinary quantity of vapours be driven by the Wind upon a certain place, which they cannot easily get over by reason of mountains, or contrary Winds, that oppose them. For example, suppose a Wind from some point between north and east carries a vast collection of vapours out of Africa to the Caribbees, this Wind lights upon the continent of America; now it is possible that not only the mountains and woods of Panama may resist the current of this Wind, and crowd the vapours together; but a contrary Wind, from a point between south and west, may blow at the same time on the western shore of America, which shall force the vapours back again. When such a rencounter happens, there must be a wild uproar in the air about the Caribbee Isles, and in all that tract between South and North-America; and the vapours in this circular motion must be furious on all sides, just as it is in water. For we see at the confluence of two rivers, if their currents be rapid at the place where they fall in, they cause violent eddies, which whirl about things that are cast into them, swallowing them for a time, and then throwing them up again.

This shews us the reason why heavy bodies are often tossed in the air by the whirling of hurricanes, and then dashed to the ground again. For the air being in a circular motion, is with great fury tossed backwards and forwards between the ground and the clouds. And as the waters of the rolling sea do not run to the shores in an even stream, but in such waves as dash by fits and turns, so the course of a violent Wind is broken and distinct blasts.

To come now to the common phenomena of Winds, the dry ones are such as carry few vapours along with them, and therefore draw off the moist particles from bodies over which they pass. Thus

in Holland the north and east Winds, with the intermediate points, are drying, because the cold northern sea yields but few vapours, in comparison of those which come from warmer parts of the Ocean: and from thence towards the east are vast tracts of land, where the heat at Midsummer is but very small. But the other Winds, especially the westerly, are moist, because they issue from warm and vaporous parts. The Western Ocean seldom fails to send us rainy Winds; however, this property varies according to the various situation of countries.

Such Winds gather clouds as blow from the quarters where the vapours arise, which, in conjunction with the vapours of our own region, fill the air. On the other side, those Winds make fair weather, which bring little vapour along with them, and bear away that which hangs over us.

Winds are warm or cold, as the countries are from whence they blow; and, therefore, when a brisk Wind blows from a cold quarter, it allays the heat of summer, which is very tiresome in still weather. Thus a quick blast of a pair of bellows will put out a flame, which a gentle blowing increases; for the quick blast drives all the flame to one side, where it is stifled by the force of the incumbent air, except it meet with more fuel on that side; but a gentle Wind augments the motion of the flame every way, and makes it seize on more parts of the fuel.

Now, because all the heat or cold of Wind proceeds from the heat or cold of the country whence it blows, therefore the same Winds are hot or cold every where. Beyond the line they are just the reverse of what they are with us; for their cold Winds are from the south, as ours are from the north; and as our south Winds are warm, for no other reason but because they bring us an air heated by the sun, for the very same reason the north Winds are warm to our Antipodes.

From what has been said it is sufficiently manifest, that the sun is the principal cause of Wind, and motion the cause of Vapours. But if we except those constant and periodical Winds which blow in some seas, the limits of the rest cannot be determined, nor can we say when they will begin, or when they will end. For instance, we cannot give a reason why an east Wind shall generally blow one summer, and a west Wind another. Possibly it might be discovered, if for several years together a nice observation was made of the Winds, and their shiftings in several countries; for that which seems inconstant and irregular to us, might perhaps be found to follow certain courses; at least we should know how far a raised Wind would continue its blast: but, till such experiments are made, we must be satisfied with what knowledge we have.

A S I A.

THIS grand division of the globe, which in the extent of its territories exceeds Europe and Africa, and which was formerly governed by the Assyrians, the Medes, the Persians, and the Greeks, comprehends four vast empires, viz. the Chinese, Japanese, Mogul, and Persian, besides the countries possessed by the Turks and Russians. Upon these four empires depend in general the numerous lesser sovereignties and kingdoms of the Asiatic regions.

The continent of Asia is situated between 25 and 180 degrees of east longitude, and between the equator and 80 degrees of north latitude. From the Dardanelles on the west, to the eastern shore of Tartary, it is in length 4740 miles; and from the most southern part of Malacca to the most northern cape of Nova Zembla, it is 4380 miles broad. The Frozen Ocean bounds it on the north; it is on the west separated from Africa by the Red Sea, and from Europe by the Levant, the Archipelago, the Hellespont, the sea of Marmora, the Bosphorus, the Black Sea, the river Don, and a line leading from it to the river Tobol, and from thence to another river, called the Ob, which discharges itself into the Frozen Ocean. The Pacific Ocean bounds this vast continent on the east, and separates it from America; and on the south it is bounded by the Indian Ocean.

The principal regions which divide this country are, Russian, Chinese, and Independent Tartary; China, Japan, the peninsula of India beyond the Ganges, containing Cochinchina, Tonquin, Pegu, and Siam; the peninsula on this side the Ganges, containing the Decan, Golconda, Bishnagar, and Malabar; Indostan, or the Mogul's Empire; Persia; Asiatic Turkey, divided into eastern and western.

Asia, as we have observed above, is not only more extensive than Europe and Africa, but is superior to them in its fine serene air, and rich fertile soil. Every convenience, and every luxury of life, are here unboundedly enjoyed. Here are citrons, olives, oranges, lemons, melons, pine-apples, tamarinds, and other delicious fruits; with wine, oil, and honey; silk,

cotton, and corn; rich metals, and precious stones; gums, spices, sugars, and the most fragrant and balsamic herbs. With these various blessings of nature, how could a people in the early ages fail to be opulent and powerful! yet such is the instability of human enjoyments, this most charming scene became a picture of horror and devastation.

Upon the decline of the Indian and Chinese empires, and after a great part of Asia had submitted to the arms of Rome, the Saracens, or successors of Mahomet, in the middle ages, founded a still more extensive empire in Asia, Africa, and Europe, than even that of the Romans when in their plenitude of power. The Turks, the avowed foes of freedom and the liberal arts, possessed themselves of the center regions of Asia, laying waste a most delightful country, and converting its fruitfulest spots into barren wildernesses. The other parts of the Asiatic territories continue in much the same situation as formerly.

The present mode of government in Asia, is absolute monarchy; and as to religion, we cannot say that Christianity is by any means established there; however, they have a toleration of sects in many parts, but these are much persecuted by the Turks. The Arabians, Turks, and Persians, profess Mahometanism, as do the natives of part of India and part of Tartary; nearly all the rest are overwhelmed with heathenism, and idolatry. Many popish missionaries, at the hazard of their lives, have visited the remotest parts of Asia, endeavouring to convert the idolaters, but to no kind of effect. The most considerable of them are those who pay adoration to Brahma and Poo: there are also the worshippers of Confucius, and others who worship the fire. These last, who do reverence to the symbol of fire, are of a very ancient sect; they acknowledge only one supreme ruler of the universe; and as this the only true God is the essence of purity and perfection, they adore him under the emblem of fire, because fire they esteem the most clear and pure symbol of the all-wise and all-just Deity.

There are Jews to be met with in every part of Asia; and indeed these people inhabited the remotest regions of

India some centuries before the discovery thereof by the Portuguese.

As to the languages spoken in Asia, almost every country or island hath a tongue of its own; the principal, however, are, the Turkish, modern Greek, Chinese, Japanese, Russian, Tartarian, Persian, Indian, Malayan, and Arabic.

The islands of Asia, (Cyprus excepted, which is in the Levant) lie in the Pacific Ocean, and the Indian Seas; the principal of which are, 1. The Japanese

islands, 3. Formosa, 4. The Philippines, 5. The Molucca or Clove isles, and the Banda or Nutmeg isles, 6. Amboyna, Celebes, Gilolo, &c. which surround the Molucca and Banda isles. 7. The Sunda isles, viz. Borneo, Sumatra, Java, Bally, Lambo, Banca, &c. 8. The Andaman and Nicobar isles. 9. Ceylon. 10. The Maldivia isles. 11. The Kurile isles, and those in the sea of Kamchatka. 12. Bombay.

We shall begin with a description of the finest country in the world, viz. the rich and flourishing empire of China.

CHAP. I.

EMPIRE of CHINA.

SECT. I.

Its Situation, Names, Divisions, and Extent; its Climate, Soil, and Produce; its Rivers, Lakes, and Canals: a general View of the Empire, in a Description of the Boundaries and Situations of the fifteen Provinces of which it is composed.

THE extensive and opulent empire of China, which is situated on the eastern borders of Asia, is bounded by Chinese Tartary on the north; by the Pacific ocean, which divides it from North America, on the east; by the Chinese sea and the kingdom of Tonquin on the south; and on the west by Tibet, from which it is separated by mountains and deserts. It is included between 20 and 42 degrees of north latitude, and between 98 and 123 degrees of east longitude, from London: it is upwards of 1440 miles in length, and in breadth about 1260.

China is called by the natives Tchong-koué; by the people of India it is named Catay; the Italians call it Cina; the Germans, Tschina; the English and Spaniards, China; and the French call it Chine. Whether the names given to it in Europe are derived from the first emperor, Tsin, or whether they are derived from a Chinese word, signifying the centre, from an idea the Chinese entertained, that their country was situated in the centre of the globe, it is difficult to determine.

According to the authors of the Universal History, this empire is divided into fifteen provinces, (exclusive of Lyau-tong, which is situated without the great wall, though under the same dominion;) each of which, in point of extensiveness, of populousness, produce, and opulence, might pass for so many kingdoms. Besides these, which are the proper bounds of the empire, a great part of Tartary is subject to the emperor, as are the islands of Tson-ming, Hai-nan, and part of Formosa; with others less considerable.

As China extends about twenty degrees from north to south, the constitution of the air, the nature of the seasons, the maturity and kinds of fruits, with other effects depending on the influences of the material heavens, vary in different parts of it. The air, in the centre of the empire, is temperate, healthful, and serene; in the south, which lies under the tropic of Cancer, it is in summer intensely hot; and the north is very cold, owing to the height of the neighbouring mountains, which are in general covered with snow, and which greatly affect the air.

This country differs very much also with respect to the surface of its ground, and qualities of its soil: some

provinces abound chiefly in dry, stony, uneven land, very ill adapted to the purposes of husbandry; though a few fertile spots may be found in them, even the finest and most fruitful provinces are in some parts sterile.

Agriculture is esteemed an honourable employment in China; and the emperor himself, one day in the year, puts his hand to the plough to open a furrow: this ceremony, which is attended with a great deal of pomp and solemnity, is kept up in conformity to ancient custom; for the Chinese pretend, that their first emperors used personally to exercise themselves in agriculture.

China produces chiefly the four following sorts of grain: rice, wheat, oats, and millet; also pease, beans, pulse, shrubs, medicinal plants, and a profusion of the richest fruits; inasmuch that nature seems to have endowed this country with a larger share of her blessings than any other.

It is principally in the culture of the hills that the inhabitants are most skilful and industrious; for these they cultivate from bottom to top, after having cut them into a kind of flat terraced walks, in the manner of stairs, and flanked them on the sides with a wall of loose stones to keep them compact; they likewise form reservoirs to preserve both the rain and spring water; and in dry seasons they supply these with water from the rivers, by means of engines constructed for the purpose; and indeed these hydraulic machines are in common use with the farmers.

The mountains produce fossils and minerals of every kind in great abundance; and in certain mines there is found a metal which the natives call pe-tong, or white copper, and on which several experiments have been made, to try if it owed its whiteness to any mixture; but it was found that it did not, and that all mixtures, silver excepted, diminished its beauty. It hath all the whiteness of silver, and if it was not more brittle, and consequently less malleable, there would scarcely be a possibility of distinguishing it from that valuable metal.

Here are great quantities of pit-coal, which, as firewood is pretty scarce, is used on most occasions: but of all the mines that abound here, those of the stone-coal are the most common and useful, as they supply the greatest part of fuel both for town and country.

Lodestone is found in almost every province; and of these the inhabitants make great use in pharmacy.

In the western parts of China there are several salt-mines, which are of infinite utility to such provinces as are at a remote distance from the sea: here are not only found salt-pits, but in many places whole acres of a greyish earth, from which are extracted prodigious quantities of salt.

BY
The Rev.

[illegible]

There are several navigable rivers in China; the most considerable is the Kiam, which rises in the province of Yun-nan, crosses three other provinces, and taking a winding course of 1200 miles, loses itself in the eastern ocean. This river is not only very broad, but also of a remarkable depth, inasmuch, that it is a common saying amongst the Chinese, "The sea hath no banks, and the Kiam no bottom;" and they pretend that in some places it absolutely has no bottom.

Another is called the Yellow River, which rises at the extremity of the mountains which bound the province of Se-tchuen in the west; from thence it throws itself into Tartary, where flowing for some time on the outside of the great wall, it re-enters China between Chan-fi and Chen-fi provinces; it then washes Ho-nan, runs across one part of Nan-king, and, after having flowed about 600 leagues, empties into the eastern ocean: it has the name of the Yellow River, because the earth it carries away with it, (particularly when there are heavy rains,) gives it a yellow colour.

There are great numbers of other rivers, less famous, though far more commodious for commerce: there are, besides, several lakes, some very extensive, and producing a variety of fish. In short, it is computed, that China contains no less than one thousand four hundred and seventy-two rivers and lakes.

Canals are cut through most of the provinces, which have a clear smooth water gliding between two banks built with flat coarse marble; over which, at proper distances, are bridges, consisting for the most part of several arches, and the central one high enough for barks to pass under without lowering their masts: these are in different places sluiced out into lesser canals, which are subdivided into still smaller streams, terminating at some great town or village, or else discharging into some lake that waters the adjacent country: and these fine streams, flowing through fruitful plains, render the face of the country beautiful beyond description. And, indeed, China far surpasses all other countries, whether considered in the fertility of its provinces, in the multitude of its inhabitants, cities and great towns; in the wisdom of its morals; the excellency of its laws, or the industry and politeness that are conspicuous throughout all the provinces: which are,

I. *Pe-tche-li*, the most northern part of the empire, situated on the frontiers of Tartary: it is about one hundred and forty leagues in length, and hath a most temperate, serene air; notwithstanding, however, this mildness of climate, the rivers are generally frozen over for near four months in the year, viz. from the latter end of November till the middle of March. This province contains about one hundred and forty cities, and is bounded with every kind of grain except rice.

II. *Chang-tong*, which is bounded on the north and west by Pe-tche-li, and by the sea on the east; it contains about one hundred and twenty cities or large walled towns. Here the soil produces every kind of grain, as well as of fruits; and the rivers and sea coasts abound with fish. But what most distinguishes this province, is the wild silk-worm, which produces a valuable white silk, the threads of which the worm (resembling a caterpillar) fastens to bushes and shrubs.

III. *Chan-fi*. This province is bounded on the north by Tartary, and borders to the east upon Pe-tche-li. It contains one hundred large towns, and produces every sort of grain except rice. The mountains here, which are numerous, are for the most part cultivated, and cut into terraces up to their very summits. Here are mines yielding a plenty of coal, iron, and other minerals.

IV. The province of *Chen-fi*, bounded by Chinese Tartary on the north and west, and on the east by Quang-fi, contains one hundred and fourteen large towns, and yields great quantities of wheat and millet, though but little rice. Here are supposed to be very rich gold mines; but these are neglected by government, from motives of policy: too great a conflux of opulence might endanger the public weal, by rendering the people inattentive to agriculture. Individuals, however, are allowed to look for the grains of gold in the sands of rivers and brooks, which yield them a sufficient supply.

V. *Ho-nan* is the most delightful province in all China, and is situated near the centre of the empire, to the south of Chan-fi and Pe-tche-li. It contains upwards of an hundred large towns, is very fertile, and appears one entire garden, except to the western part, where there is a range of mountains covered with forests.

VI. *Kian-nan* is the richest and most flourishing province in the whole empire: it borders upon Ho-nan to the west, and the sea to the east: it contains upwards of an hundred large towns, of which Nan-king is the capital, and pays thirty-two millions of taels annually to the revenue, which, according to P. Du Halde, amount to one hundred and sixty millions of French livres.

VII. *Hou-quang* is situated near the centre of the empire, as well as Ho-nan, to which, on the north side, it is adjacent. This province, which is nearly as extensive as the whole kingdom of France, abounds with every kind of grain; and produces also a plenty of fruits, fowl and cattle. It contains one hundred and twenty-nine fortified towns; and its capital, Voutchang, is as large and populous as Paris.

VIII. The province of *Se-tchuen* is as extensive as Spain and Portugal; it has ninety-eight large towns, and is bounded on the north by Chen-fi, on the west by occidental Tartary, and on the east by Hou-quang. It produces great quantities of silk, tin, iron, lapis lazuli, lead, cinnabar, vitriol and allum, sugar-canes, cloves, nutmegs, mufk, and the very best rhubarb in all China.

IX. *Tche-kiang* is famous for its fine and beautiful silks: it is one of the smallest provinces in China, but in its commerce excels most of them. It is bounded on the north and west by Kiang-nan, and on the east by the sea; it has eighty-eight walled towns, and a considerable number of others.

X. *Kiang-fi* is celebrated for its manufactures of stuffs and porcelain-ware, and produces grain of every sort, particularly rice; its inhabitants, however, are so numerous, that there is scarce a sufficiency to supply their wants. It is bounded by Kiang-nan and Ho-nan to the north, Hou-quang to the west, and a part of Tche-kiang to the east; it has eighty-four considerable towns, and abounds with gold and silver mines, as well as those of tin and iron.

XI. *Fo-kien* is a small province, and contains only sixty-nine towns; its foreign commerce, however, greatly enriches it: it is situated between Tche-kiang and Kiang-fi, and it lying open to the sea in almost every other extremity, has great advantage with respect to its trade with the Philippine islands, as well as with Japan, Java, Siam, Cambaya, and other countries; and its mountains, which are covered with forests, furnish wood proper for ship-building. This province produces, in great plenty, all sorts of grain, as well as silk, cotton, iron, tin, and quicksilver. The finest rock-crystal is got here; and the artificers who live near the mountains where it is produced, are skilful in cutting, engraving upon it, and making it into seals, buttons, the figures of animals, and such devices. The mountains of this province also produce porphyry, and quarries of fine marble of various sorts, which, if properly polished, would equal the best to be found in Europe; little use of it, however, is made in the public buildings of the Chinese.

XII. *Quang-tong*, which is divided into ten districts, equals, either in extent or fertility, the fine country of Italy; and, like Italy, it resembles a boot; at the lower end of which there is an island called Hai-nan, of an oval figure. It is situated at the southern extremity of the empire, and is bounded by Fo-kien on the north-east, Kiang-fi on the north, and on the west by Quang-fi. It contains more than ninety great towns, the most considerable and wealthy of which is Canton, as called by the Europeans, but which the natives call Quang-tcheou. Besides every kind of grain, this province produces bananas, ananas, and other rich fruits; also silk, cotton, pearls, gold, precious stones, sugar, quicksilver, copper, tin, iron, steel, salt-petre, ebony, eagle-wood, and several kinds of sweet-scented wood. The soil here is said to be so fertile, as to yield two crops of grain in a year.

XIII. and

XIII. and XIV. *Quang-fi* and *Koei-tcheou* join each other, and are situated to the south; they are by no means equal to any of the provinces of China either in opulence or extent: *Quang-fi* is mountainous and barren, except in the eastern and southern parts, which produce a good deal of rice. *Koei-tcheou* is so poor and sterile, that a great part of its inhabitants subsist in general at the charge of the public.

XV. *Tun-nan* is a very fertile province, producing every necessary of life; which is in a great measure owing to its rivers and lakes, with which it abounds. It is, to the north and the east of its frontiers, bounded by *Setchuen*, *Koei-tcheou* and *Quang-fi*, and to the south and the west by the kingdoms of *Tong-king*, *Pegu*, *Ava*, and *Tibet*. It has seventy-six large towns, and produces amber, musk, frankincense, precious stones, and other valuable articles.

The above will serve to convey a grand idea of the extent and riches of this vast and flourishing empire: We shall therefore now proceed to an accurate and comprehensive description of every curiosity, whether natural or artificial, worthy the attention of our readers.

SECT. II.

Trees, Fruits, flowering and other Shrubs, and medicinal Plants, and roots.

IN China are seen most of the kinds of fruit-trees that we have in Europe; the fruit, however, in general, is not equal in goodness to ours; for the Chinese know not how to graft or cultivate their trees in the manner we do. Oranges are very common in China; they have trees of this fruit of several kinds, bearing in general very plentifully: one in particular, of a small size and thin smooth rind, hath a most rich flavour; and the province of *Fo-ki-n* produces a larger kind that is equally delicious, the rind of which is of a bright red, and smooth: but the Canton oranges are still superior to those of *Fo-ki-n* in point of size, and are extremely pleasant to the taste; they are of a yellow colour, and are esteemed medicinal: there are others of them of a quick sharpish taste. Lemons and citrons grow in the southern provinces in the greatest plenty; but of these the inhabitants make no other use than piling them up, by way of shew, in their vases of porcelain, merely to gratify the eye. There are two sorts of melons in China, the one small, and the other large; the meat of the former is of a yellow colour, and that of the latter white and red: this latter melon is what they call in Italy and other countries the water melon.

The Chinese have a most delicious fruit, which they call *Li-tchi*; it is about the size of a date; the stone is long, hard, and covered with a soft, moist pulp, of a most rich flavour; over the whole is a thin but rough skin; and it resembles an egg in shape. This fruit, however, when dried, loses much of its flavour, and becomes black and wrinkled like a prune.

There is the mango, with a yellow coat, of a sharp taste and exquisite smell; the long-yen, with a white coat; and the ya-ta, resembling a pine-apple. These are delicate fruits, little known in Europe. The *tsie-tie* is another fine fruit; it grows in almost every part of China, and is of several kinds: those in the southern provinces taste much like sugar, and dissolve in the mouth; their rind is clear, smooth, transparent, and of a beautiful red when ripe. Some are of the shape of an egg, but in general bigger. This fruit, when dried, is covered with a fugged mealy coat, like our figs.

The largest fruit in China, and perhaps in the world, is the *po-lo-mie*: some of these weigh not less than an hundred pounds. This fruit, however, is not confined to the soil of China; for it grows in India, *Luconia*, and other parts. It contains a great quantity of nuts of a deep yellow, and the kernel hath a most pleasant taste when roasted: the Indians dress it in the milk of the cocoa-nut, and make a very excellent dish of it. The *po-lo-mie* does not hang on its branches like other fruit, for these could not support it; it grows out immediately from the tree's trunk.

These several kinds of fruit grow naturally in China, and almost without any assistance from art; for the

Chinese, as hath been already observed, are strangers to the art of grafting.

One of the most remarkable of their trees is that which produces *pease*; for the shape, colour and taste are very much like those of the European pea. In *Quang-fi* there are trees, which, instead of pith, have a soft pulp, of which pretty good flour is made. The double tree is a very remarkable one, being partly cypress and partly juniper; the trunk, which is about a foot and a half in circumference, puts forth its branches very near the ground; and as these branches are very thick, they give the tree the appearance of a bush: its leaves and branches, which are half cypress and half juniper, grow as follow: those of the cypress grow towards the top of the tree, and are broader as well as thicker than the others; and what is still more singular, the cypress leaves are sometimes seen growing at the end of a tuft of juniper, and sometimes a tuft of juniper at the end of a branch of cypress. The juniper leaves are long, strait, pointed, and ranged in regular rows, resembling plumes of different rays, and chiefly on the lower branches. This tree bears a small round berry, scarce larger than that of a juniper, which suspends by long stalks from its branches, and contains two reddish seeds, in the form of a heart, of a very hard substance: the wood is of a reddish colour, and of much the nature of juniper, and contains some turpentine.

Among other trees peculiar to China, there is a kind of pepper-tree, the fruit of which is a sort of berry about the size of a pea, and is of a greyish colour, with small red streaks. When the berries are ripe, they open of themselves, and shew a little black stone, which hath so powerful a smell, that it even affects the brain: upon which account the gatherers of these berries are under a necessity of plucking them only at intervals. After the berries are dried in the sun, the stones are thrown away, and the rind is only made use of; which, though not so agreeable as the pepper from India, is good in sauces.

There are two sorts of Varnish Trees, the one called *Tsi-chu*, and the other *Tong-chu*. The *Tsi-chu* produces the substance of that beautiful Chinese varnish so much admired by the Europeans; a secret the farther removed out of the reach of imitation, as it is a production of nature, and no composition of art. It is of a small size, with a whitish bark, and a leaf like that of the wild cherry-tree: the gum, which distills down by drop, is of a reddish colour. In order to extract it, incisions are made, one above another, round the tree up to the top; the fruit round of incisions begins about seven inches from the ground: in each incision a shell is stuck for the reception of the gum, which oozes through the wound. Though the varnish is not equal to that produced in Japan, it is held in the very highest estimation: it takes all colours alike, and, if properly managed, neither loses its lustre by the change of the air, nor the age of the wood to which it is applied. The Varnish-Tree distills only in the night, and the gum is always extracted in the hottest season of the year. The Chinese are well satisfied, if the produce of a thousand trees in one night amounts to twenty pounds weight of varnish. The tree rarely rises above fifteen feet high, and its common circumference is two and a half. The gum is a strong poison; so that those who collect it are forced to make use of several preservatives against its malignancy.

The other tree, or *Tong-chu*, very nearly resembles our walnut-tree, and bears a kind of nut, from which they press a thick oil by boiling it with litharge. It is used frequently to varnish the ceilings, pillars, or floors of the houses of the great.

The *Kou-chu*, resembling the European fig-tree, is a very remarkable tree; it yielding a milk, which the Chinese use as fize in gilding with leaf gold. And the tallow-tree, which is as high as a large cherry-tree, is equally remarkable: its branches are crooked, and its leaves, which are in the form of an heart, have a most lively red: the fruit is inclosed within a rind divided into three segments, which open when it is ripe, and discover three white kernels. This mixture of white and red hath a very beautiful appearance; and the kernels have all the qualities of tallow; they have the consistence,

siffence, the colours, and the smell of it. They are made into candles, mixing only a little oil in melting to render them more pliant: but these candles do not give so clear a light as ours, which probably may be owing to the wick; for instead of cotton, of which they have great plenty, they use a small stick of a dry light wood, wrapped round with the inner part of a rush. The figure of these candles, as they burn them, is that of an inverted cone; they burn with a yellowish flame, sending forth a thicker smoke as well as stronger smell than ours do.

But amongst the curious productions of China, I let us not omit to make mention of the Pe-la-chu, or White-wax tree, which in the proper seasons is covered with swarms of insects, that lay on its branches thin films or threads of wax, smaller and finer than those produced by bees, though far superior in whiteness and lustre. The tree is not so high as the tallow-tree, and differs from it in the shape of its leaves, which are longer than they are broad.

As to the garden-flowers of the Chinese, they are very inferior to the European, except their pines, which have a beautiful colour and agreeable smell: but with regard to flowering shrubs, China surpasses Europe: these would be a most charming ornament to gardens, were they disposed of with judgement: some of these bear flowers of the most lively fresh colour, others different kinds of tulips, lilies, and jessamins; and in some of the southern provinces there are even large trees thus elegantly and gloriously adorned. Of this sort is the Quey-wha, which sometimes rises to the height of the tallest oaks; its flowers are small, of various colours, and breathe a most fragrant smell; the leaves are like those of the laurel. This tree blossoms four times in the year, at least some sorts of them do, for there are various kinds; and their beautiful flowers exhibit a most delightful picture. There is also the Tchak-ou, a fine ever green, of four kinds, that bear flowers, all of which resemble the Spanish laurel: when the stalks of its leaves join the branches, buds of the size, form and colour of a hazel nut, shoot forth, covered with a kind of delicate white hair; and these buds, opening in December, produce double flowers like small roses, joined immediately to the branches without any stalks. The trees of the second sort are very high, and flowers red and large, which, mixed with the green leaves, have a most pleasing aspect. The flowers of the two other kinds are small and whitish, and the middle of them is filled with small ligaments, and have each a flat yellow top as in common roses, with a round pistil in the centre.

Besides the banana-tree, the betel, the mango, the cotton, the cassia-fistula, and other trees, they have almost every kind of tree that Europe furnishes; but that most in esteem is the nan-mon, which is of so hard a nature, that the Chinese say whatever is formed of it will last to eternity: the gates, pillars and beams of the ancient palaces of the emperors are of this wood. But in point of beauty the Tset-am is inferior to none: it is of a dark red, and full of fine veins, which appear as if painted: it is proper for cabinets, and the very finest sort of joiners work.

For strength, firmness, and durability, the iron wood produced in China is equal to any: the tree hath a slender trunk, and grows as high as an oak; its wood is so heavy, that it sinks if put into water. The anchors of ships of war are made of this wood; and the officers of the emperor vainly boast, that these anchors of wood are better than real iron ones.

We shall now treat of the cane commonly called a bamboo, which is of the most extensive utility; the stem of it is hollow, (except at the knots that separate the joints) and equals, in both thickness and height, the trunk of a common sized tree; the pith of it, when young, has an exquisite taste, and the bud is a very fine fruit. This sort of cane is found in marshy grounds, and its shoots, in process of time, become hard enough to support a considerable weight; wherefore in some places it is made use of in building, as well as for pipes to convey water, and several other purposes. As it will admit of being separated into splinters, the

Chinese makes baskets and other things of it; and after all, when it gets rotten, and breaks, the natives boil it in water, till it becomes reduced to a sort of paste, that serves to make paper of different kinds. But of all the different sorts of wood used in China for building with, the Nan-mu is in highest estimation, and is generally used in making columns, window-frames, doors, and joists for superb edifices.

In the province of Quang-tong there is a reed of a very peculiar nature; the stem of it is not thicker than one's finger; it creeps upon the ground, and puts forth shoots of a considerable length, divided into fibres or strings, of which is made all sorts of cordage: the stem is cut also into threads, and thereof made baskets, seats, the panels of sedan chairs, and those fine mats so much admired in England and other parts.

As the Chinese drink tea for their common liquor, it is now necessary to speak of the Tea-tree, which is of the shrub kind. This shrub we will distinguish into two principal sorts; the first, called Song-co tcha, is the same which we call green tea: it grows in common from five to six feet, and sometimes considerably higher; its root is like that of a peach-tree, and its flower resembles that of the wild white rose; several stems, each about an inch thick, rise and entwine from the root to the height of the tree, where they separate into different collections, and form a bushy head like a myrtle. Although the assemblage of stems which compose the trunk of the tree have a dry and withered appearance, they notwithstanding yield branches and leaves of a very beautiful green, which latter are generally from one to two inches long, and are indented at the edges. This shrub, which is an evergreen, flowers from October to January: it is usually planted in rows, and is kept pruned to prevent its growing too high: in some provinces where it is suffered to grow to its full height, it will reach to ten or twelve feet; therefore when the branches are young and tender, the people cause them to hang downward, that the leaves may be gathered with the greater facility: it must be planted anew every four or five years, else the leaf becomes thick, hard, and rough. Another kind of tea-shrub, called Vou-y, or bohea, is produced in Fo-kien, and takes its name from a famous mountain; and the only difference between the tea that grows here and the former is, that its leaves are rounder and shorter, inclining to a black colour, and yielding a tincture of a deeper yellow. As it hath an agreeable taste, and the decoction will not hurt the most weak stomach, it is used throughout China. Of this kind there are three sorts; the first is the tender leaf when scarcely opened, which is esteemed the best, and called imperial tea, it being chiefly destined for the emperor and his family; and this is gathered about the beginning of March. The second consists of leaves stronger and more plentiful, and which are esteemed a very good sort, though not of so fine a flavour as the former: these are gathered in April. The third and last gathering is in May, when the leaves are at the largest. There are several other kinds of tea, little different from the two principal, except what is owing to the quality of the soil in which the shrubs are planted. The method of cultivating the shrub, which is most commonly planted at the feet of mountains, and lying open to the south, is as follows: holes being made of about four or five inches in depth, they drop eight or ten seeds into each; the reason why they sow several grains together is, because of four or five dropt in a hole, they often miss of a single shoot: the want of knowing this may be one reason why Europeans have not succeeded in their attempts to raise this shrub. As the plant comes on, it is necessary to dung it well once in twelve months at least: at the age of three years it bears, in plenty, good leaves; and, at the age of seven, rises five or six feet in height, though yielding fewer branches and leaves; wherefore they lop the tree close to its stem, which occasions fresh shoots and leaves to come forth from it the next year. They do not, in gathering-time, pluck the leaves by handfuls, but a single leaf at a time; and however tedious this method may seem, a dextrous gatherer will, in the course of a day, pluck not less than ten or a dozen pounds.

It has been already observed, that the Chinese make use of tea as their common liquor: it may not therefore be unnecessary to mention how long it is kept before the natives use it: they at least keep it a whole year; for if it were drunk when new, it would greatly endanger the head and nerves. It is apprehended, that there is no plant in the habitable world, which, taken in the same quantity with tea, either in decoction or infusion, that is to light upon the stomach, or more effectually revives and quickens the spirits of a Chinese; and it would in all human probability have the same effect upon an European, did it not lose, in its long passage, a considerable part of its volatile and medicinal virtues.

Amongst the various other shrubs which grow in China, those in the lakes are remarkable for their beautiful flowers; and the waters, thus elegantly decorated, form a most agreeable and pleasing spectacle. These flowers are also preserved in little ponds, or in vessels filled with mud and water in the gardens of the great. The Lien-hoa, whole long leaves swim upon the surface of the water, and communicate with the root by long strings, greatly resembles a tulip; its colour is either violet or white, or part white and part red, and has a most grateful smell: it rises to a considerable height above the water's surface, and bears fruit as big as a walnut, the kernel of which is white and of an agreeable taste. The root of this shrub is very salubrious, and much eaten.

But of all the shrubs growing in this country, the cotton shrub is looked upon as the most useful. As soon as the harvest is got in, the peasants sow cotton in the fields, and raking the earth over the seeds, there soon springs up a shrub about two feet high, the flowers of which are in general yellow, but sometimes red: a small button, about as big as a nut, and opening in three places, succeeds the flower, and, on the fortieth day after the flower's appearance, discovers three or four wrappings of white cotton, this being fastened to the bottom pod, contains seed for the year ensuing. As all the fibres of the cotton are fastened strongly to the seeds they inclose, the people separate them with an engine. The cotton is afterwards carded, spun, woven, and converted into calico.

It must be naturally supposed, that in so extensive a country medicinal plants and roots must be numerous. Amongst these is the fou-ling, or China root, the admirable virtues of which are well known in Europe. Rhubarb grows plentifully in several parts, the leaves of which are long, broad, and rough to the touch; the flowers resemble tufts in the shape of a bell, but are jagged at the edge; and the root, while fresh, is whitish within; but when dried, it assumes the colour it has when brought to us. The tho-ang is the root of a very beautiful plant, and is much used as a gradual restorative of decayed strength. The fant-fi is a most valuable medicine, and hath a variety of virtues. But of all the medical plants, none are held in such general estimation as the gin-feng; though this cannot be styled a natural production of the country, being chiefly imported from Chinese Tartary. Among the many excellent virtues of this plant, it is efficacious in fortifying the stomach and purifying the blood; the stem of it is covered with a rough shaggy tunicle, whilst the other parts are smooth and round: it is of a deep red colour, except towards the bottom of the stem, where it appears rather white: it grows to the height of about eighteen inches, and puts forth its branches towards the top, bearing small oblong leaves, of a woolly substance, and at the edges indented: the upper part of the leaf is of a dark green, and the under part of a light and lucid green. The root of this plant is reported to resemble the hands, feet, and even the visage of a man.

There are many plantations of tobacco in all parts of China, and the natives are much given to smoking.

SECT. III.

Quadrupeds, Birds, Insects, Reptiles, and Fishes; method of flaking Ponds for Fish; Ways of catching those Aquatics: curious Method of catching the Wild-duck.

MOST of the animals known in Europe are to be found in China, which abounds with rich pasture-

grounds. One of the most remarkable animals is a kind of camel, not higher than a common horse; it has two bunches on its back, covered with long hair, forming a kind of saddle: its legs are pretty well proportioned, and not so long as those of common camels; and its neck, which is thicker and shorter, is covered with a thick hair. Some of these animals are of a dun colour, and others are inclining to red, and of an ash colour in some places.

The tyger, buffalo, rhinoceros, and wild boar, are all natives of China; but the lion is not found here; nor are elephants common in this country. Stags and hares are to be seen in great abundance.

The Chinese tyger exceeds most others both in size and fierceness; and in the winter, the inhabitants of such villages as are not well fenced are forced to retire into their houses before the dusk of the evening, and fasten well their doors, to secure themselves against this devouring creature.

The hiang-tchang-tse, or musk roe-buck, is an extraordinary animal: it is a species of deer, without horns, and hath dark hair. The bladder or bag that grows beneath its belly, exhibits, when opened, grains of musk sticking to the inner coats of the bag. The flesh of serpents is said to be the common food of this animal; and though these serpents are of an enormous size, the roe-buck easily destroys them; for they are so overpowered and stupefied with the scent of the musk, as to become motionless.

In the province of Chang-tong there is a species of bears, which some say walk upon their hind legs, and have a face somewhat resembling the human, with a beard like that of a goat: they are reported to climb up trees, and to feed upon the fruit.

In Yun-nan province there is an animal not less curious, though less frightful than the foregoing; this is a particular kind of stag, no larger than a common dog, and which is kept in the gardens of the gentry.

The horses here are very fleet, but small. The black hogs, which are very numerous, are fine food, and much eaten by the natives; who are fond also of the flesh of dogs and wild horses, which are dressed in a variety of ways.

Of the feathered tribe, the Golden Pheasant claims our first notice, whether we consider the beauty of its plumes, or the delicacy of its flesh as food, which far surpasses that of the European pheasant. A lively shining red, joined with the finest yellow, paint the feathers of the cock pheasant, with a beautiful gradation and variety of shades; a yellow tuft, bright as burnished gold, forms its crest, whilst a diversity of other colours adorns the plumage of its back, wings, and tail.

The hait-fing is also a very beautiful bird: it only inhabits the province of Chen-fi, and some parts of Tartary. It is equal in beauty, and superior in size, to the finest falcon; whence it may be justly styled the king of the birds of prey in China and Tartary.

There are in China parrots of all sorts; likewise wild and tame peacocks, fowls of every kind, and most of the birds to be met with in Great Britain; together with bats of a prodigious size.

Among the insects, the silk-worms hold the first rank, whether their number or their utility be considered: there is the greatest plenty of them in the southern provinces.

In the province of Quang-tong there is a kind of butterfly of an uncommon size as well as beauty; it is particularly admired for the variety of its colours; and is easily taken, being altogether motionless in the day-time. In the evening it begins to flutter about like our bat, and is nearly as big. The finest and beautifullest of these insects are sent to court, for the imperial family.

The fields of China, particularly in dry summers succeeding wet ones, swarm with locusts; they sometimes appear in such multitudes as even to darken the skies, and commit the most dreadful devastations on land bearing grain.

What is most worthy of notice in the reptile kind is a sort of lizards, called by some Wall-dragons, because they

they are found creeping upon wall, they are by others called Guard-ladies, from their having, as pretended, the amazing virtue of both proving and preserving female chastity.

There are all kinds of fish in the different rivers, lakes, and canals, besides those from the sea-coasts. In a river in the province of Hoa-quang, great numbers of different-sized tortoises are taken. The armour-fish is much esteemed; it is so called, from its being cased in a coat of hard scales, placed one over another, like tiles on the roof of a house; it weighs about forty pounds, and is white and delicate within. One of the best kinds of fish is that resembling a sea-beam, which weighs about six pounds. The meal-fish is very delicate food: The black circles of the eyes of this fish are surrounded with two circles resembling rings of bright silver. They are found in such shoals, that a single drag of a net will secure not less than four hundred weight. The yellow-fish, found in the river Yang-tse-kiang, and which are to be caught only at certain seasons, are fine food, and of an extraordinary size; some of them weigh not less than seven or eight hundred pounds.

Persons of distinction keep in their courts, houses, or gardens, the Kin-yu, or gold fish, which are in length from three to eight inches, and extremely beautiful. The male, from the middle of its body to its head, is of a bright red, and from thence downwards of a glittering gold colour. They are put into deep vessels, at the bottom of which is placed an oblong vase, bottom upwards, and pierced full of holes, to shelter the fish from the extreme heat of the sun, or any thing else that may be offensive to them, they being so delicately tender in their nature, that unless great care is taken of them, they will be subject to many accidents.

The method the Chinese use to stock their ponds with fish, is as follows: In May they place mats and hurdles across the river Yang-tse-kiang, leaving room only for the passage of boats: these hurdles stop the spawn, which, with the water, they convey into proper vessels.

The Chinese not only make use of lines and nets for fishing, as we do, but practise also methods of a singular invention. In some of their provinces they train up a species of birds of the cormorant kind to this exercise, which being taught to follow the fishermen to their boats, as obediently as so many dogs, begin their work at day-break, in the following manner: at a signal given by striking the water with an oar, the birds take their flight, and dispersing over the river, watch their prey, and suddenly diving, seize the fish by the middle, and then rising, carry it to the boat. The fisherman takes up the bird, and holding its head downward, passes his hand along its neck, to make it discharge the fish; for the fish is prevented from entering the gullet by a ring put on the lower part of the neck. When a fish happens to be too large for a single bird, two birds join together, both in the attack and the conveyance of it; one takes the head, the other the tail, and thus fly away with it to the boat.

In some other parts the fishermen make use of long narrow boats, to each side of which they fix a plank that is as long as the boat, and about two feet broad. These planks are painted white, and overlaid with a shining varnish, and reach sloping down to the water's surface. The fishermen go out in these boats in the night-time, when the moon shines bright, which heightens the splendor of the varnish; so that the fish, playing about the boats, and mistaking the brightness of the plank for that of their element, leap into the boats and are secured.

In some places they shoot fish with small arrows, fastened to the bow with pack-thread, which serves both to save the arrow, and also to draw in the fish when shot. They sometimes catch fish by diving; and in places where there are great numbers in the mud, men stand up to their waists in water, and pierce them with a kind of barbed trident.

Wild-duck hunting is a very common practice amongst the Chinese: they scoop a calabash, or large gourd, and fit it to their heads, leaving proper apertures for sight and respiration; they then go naked into the water up to their chins, that nothing may appear above water but

the calabash, which the duck being accustomed to see floating, soon approaches, and pecking at it, the duck-hunter seizes him by the feet and secures him.

SECT. IV.

Origin of the Chinese Empire; Persons of the Nation, their Dresses, Manners, Customs, and National Prejudices.

THE founder of the Chinese Empire, according to both Asiatic and European historians, was Fo-hi, who is recorded in the annals of China to have reigned about three thousand years before Christ, or six hundred before the deluge, according to the vulgar scripture chronology. The Chinese annals inform us too, that Fo-hi being the first who civilized the natives, they, for this reason, elected him their king: hence we discover that the country could not at this period be thin of inhabitants, and consequently that the origin of this people must be still more ancient than the reign of Fo-hi: indeed some Chinese historians have asserted, that their countrymen were settled here even several thousand years before Fo-hi held the imperial sceptre. Such have been the ambitious and extravagant pretensions of these men to the honours of antiquity. Agreeably, however, to the regular history of China, in which the literati seem unanimously to concur, that country hath had its king; upwards of two thousand years. It is not improbable that some of the great grand-children of Noah dispersed themselves through the Asiatic regions; and reached in process of time the most westerly parts of China. Indeed Dr. Shackford, a warm advocate for the antiquity of the Chinese, asserts that they are the immediate descendants of Noah: he supposes the ark was left by the waters of the deluge upon a ridge of mountains, bordering on the frontiers of China; and that Noah and his sons settled and took up their residence here. He further thinks that Noah and Fo-hi were one and the same person.

The most general opinion is, that this country was first peopled within a century or two after the deluge, at the time of the dispersion which followed the confusion of tongues, when a scattered Babylonian colony founded the empire of China, and elected Fo-hi their prince, on account of the great abilities and virtues which distinguished him.

Whoever or whatever instituted this empire, certain it is, that the people in those early ages applied themselves chiefly to agriculture, and the education of their children; they were judicious, frugal, and industrious: the governors or head people were wise, prudent, penetrating, and in their public decisions equitable. These governors or princes gained the hearts of the people by their patriotic and virtuous public conduct; their whole happiness centered in the welfare and felicity of their subjects. Thus the Chinese required such reputation, that they were admired and revered by all the countries round them; and hence they vainly gave it out, that they were placed by heaven in the middle of the globe to administer laws to the rest of mankind.

As to the persons of the natives, a woman in this country is deemed handsome who is somewhat under the common size, has little eyes, large ears hanging low, a short nose, red lips, black hair, horrid complexion, and a middle sized mouth: and such men are admired by the women, who have broad faces, high foreheads, flat noses, wide nostrils, thick legs, and round shoulders.

In the southern parts of the empire, where the sun hath great influence, the natives are of an olive colour; but in the northern parts they have as good complexions as any Europeans: the young people in particular, are comely, graceful, and handsome.

The women of this country are remarkable for the smallness of their feet, which, in the state of infancy, are cramped and bound up so hard, that they never grow to the size prescribed by nature; but whatever pain infants endure by this, they never complain what they have suffered when they grow up; they rather pride themselves in this violence offered to nature, and affect

always to shew their feet as they walk, or rather as they hobble and totter along the streets.

It is common for a young woman in China, of about twenty years of age, to have feet no bigger than those of a sucking child with us.

Some attribute this pernicious and abominable custom to an act of policy among the ancient Chinese, who are said to have invented it to keep their wives from gadding abroad: though it is affirmed by others, that it was first brought into vogue by the empress Ta-kia, who having remarkably small feet, affected the wearing of bandages, in order to make them still less; thus seeking to cover a real deformity with the pretence of a beauty.

The men shave their heads, except in one part of the crown, where a lock of hair is suffered to grow, which they braid and twist. This custom they have observed ever since the edict issued by the Tartarian emperors in the last century, for the Chinese to cut off their hair. In the summer they wear a small cap, made of cane or rattan: the cap, which is in the form of a funnel, only covers the top of the head, it is lined with satin, and at the top of it is a tuft of bright red cow-hair, spreading over it to the very edges. But the doctors and other learned men wear a paste-board cap, which is both lined and covered with satin, and is embellished with a very gaudy tuft of rich red silk.

In the winter season a very warm cap is worn; it is bordered with sable or ermine, and covered with red silk falling round it to the edges; this makes a very fine appearance, and flutters in the air as the wearer of it walks along: the border of ermine is broad and very handsome; and when a mandarin appears full dressed, he adorns his cap with a diamond or some other valuable stone.

The other parts of the dress of the men differs in form but little from that of the women; their vest or under garment reaches almost to the ground, and over it they wear another something shorter, with large sleeves and without a collar: they tie round them a silk sash, with the ends hanging down to their knees; and in this sash they have a convenience for putting several small things, such as a purse, a knife, an ivory fork, &c. they wear large drawers, buskins, and a kind of slippers without heels. As the whole body-dress of a Chinese is wide, and fits loose upon him, he can form no idea of what an European finds a genteel shape.

Their shirts are made of sorts of cloth, and are very wide, but short. In summer they go with their necks quite bare, but cover them in the winter with satin, fable, or fox skin; and in this season they line their vests with sheep-skins. Persons of distinction line them entirely with ermine, or fine fox-skin with an ermine border; and, when they make a visit of any consequence, wear a long silk gown over the vest: this gown is in general blue, and over it is either a black or else violet-colored cloak reaching to their knees. They appear also in their buskins, with a scymeter by their side, and a fan in their hand.

There are some persons of a particular rank in life who must never presume to go abroad without their buskins: even though they walk on foot, or are carried in a sedan, still they are constrained to wear them. When on a formal visit, if the persons they go to see happen not to have their buskins on, no words are exchanged or ceremony passes till they have put them on. These buskins are made of silk, and the hole under them of a pink stuff lined with cotton.

The Chinese, who affect a very grave aspect, suffer their beards to grow after they have lived to the age of about thirty. Having a particular veneration for a long beard: the beard however is never very thick; for the young men in general pluck it out with nippers, till they arrive at that period, when they think it necessary to nourish and promote the growth of it, as an honourable mark of their ripper years.

The doctors and other literati, especially if they have a respectable ancestry to boast, suffer the nail of their little fingers to grow very long, which they scrape and polish with great care; this being a distinguishing mark of a gentleman, and shews they have never been used to any laborious or mechanical employment.

The ladies of China, who are as vain as those of any

country, wear for their upper garment a robe reaching to their heels, with large sleeves, and a collar of white satin round their necks: underneath this robe they wear another with tight sleeves, and of the same length: they wear likewise silk drawers, reaching half way down their legs; and, below these, short stockings made of the same: their slippers are peaked, with square heels, turned up at the toes, and embroidered with gold, silver, or silk.

The robes of youthful ladies are of blue, or green, or any other colour; but those worn by ladies advanced in years, are either violet or black.

A Chinese lady, though kept in the most reclusive manner, will spend three or four hours in a morning in setting off her head-dress, which consists of a great many curls or ringlets, interspersed with small tufts of gold and silver flowers, and is sometimes crowned with the figure of a bird gilt with silver, its extended wings embracing the lady's temples, its spreading tail forming a plume on the middle of her head, and its neck, which is curiously jointed, moving with the gentlest motion of the head. Ladies of high rank have several of these birds united and formed in a kind of crown, with which they make a grand appearance. Many ladies wear a paste-board cap covered with silk, the fore part rising above the forehead in a point, decorated with the richest ornaments, such as diamonds or pearls: the upper part of their heads they embellish with natural or artificial flowers, mixed with small bodkins stuck with jewels. But women in years, especially the wives of tradesmen, wrap only a piece of silk round their heads.

The subjects of China are not allowed to wear all colours indiscriminately: for instance, none must wear yellow robes and girdles but the emperor and the royal family.

There is a strange custom prevails among the Chinese women, which is that of chewing betel continually, which greatly blackens their teeth.

The disposition of the Chinese is in general affable, mild, and obliging; there are no people who equal them in courtesy and good-breeding: they do not, however, consider ceremony merely as an exchange of compliments and civilities, but as the cement of society, and the great preserver of decorum and subordination among men: accordingly they have a great number of treatises on this subject, laying down instructions on the most minute particulars of behaviour, as touching the manner of saluting, visiting, making presents, writing letters, entertaining at table, &c. and these customs have so far acquired the force of law, that none are permitted to dispense with them: even among the very lowest class of people there is a degree of ceremony observed; and there is never to be seen that rude behaviour practised by the vulgar of other countries.

The Chinese are, however, mercenary, cowardly, treacherous, and vindictive. In some parts of China they will sell or mortgage their estates in the support of a law suit, in order to ruin an adversary. Interest is the master-spring of all their actions; they will cheat one another as much as possible; and as to strangers, these they always endeavour to defraud, and boast of it. The lower sort of people have innumerable schemes and tricks to adulterate or disguise what they offer to sale. If a stranger purchases singly and of himself, he is sure to be cheated; and there is no way of preventing it, except by employing an honest native (if any can be found) who is well acquainted with all the tricks practised by his countrymen. It is dangerous to lend them any thing without securities; for there is no relying upon a single word they say. Some of them have been known to borrow small sums of money, with the promise of returning it with an high interest, which they very punctually performed; but afterwards requesting the loan of a trifle and larger sum, with this have gone off, and have never after been heard of.

Among their several tricks, there have been instances of their opening the breads of fowls, taking out the substance, filling up the skin, and then so dexterously closing it, as to obviate all discovery or suspicion till it comes to be eaten.

Amongst such a dishonest set of people, it must naturally

turally be concluded, that there are great numbers of such as we may stile professed thieves: they will break through the thickest walls, and burn down doors or gates with an engine that fires the wood without creating any flame. They penetrate, unseen, into the most private places, and will strip rooms without leaving the least appearance of a footstep or other mark.

These are the sentiments of the generality of authors; but in order to be as impartial as possible, it is necessary to observe with a late writer, "that the empire of China, from the diffidence and policy of the government, is extremely difficult to be known. Nobody has permission to penetrate into it beyond the sea-ports, unless it was formerly the jesuits, upon whose accounts, though sometimes very curious, we cannot always depend.

Travellers that have touched at Canton agree very well in their accounts: they all assert the Chinese to be a faithless, deceiving, cowardly, thievish, paltry set of rascals, mandarines and all; but allow that the people, in general, are the pictures of unremitting industry, and from these accounts we form our ideas of that immense empire. But it should be remembered, that these authors have formed their ideas merely from a part, and that the trading part of a nation, which contains scarcely three trading ports: we ought not to suppose that all China is peopled with such beings; on the contrary, we have the greatest reason to believe, that the better part of the nation are as respectable as any other under the sun, and this is not from partial accounts, but greatly from the reason of the thing."

The Chinese usually sit upon their feet for want of chairs. When they meet one another they lift up their hands, but touch neither hat or cap, and do not move their feet, but bow a little, saying, "hoaw, hoaw," that is, "good, good." When two friends meet after a very long absence, they both kneel down, and then prostrate themselves; after this they rise up, and repeat the same ceremony two or three times.

With respect to social converse, the Chinese always use the most submissive and respectful terms, and generally speak in the third person; thus, instead of saying, "I am sensible of the favour you have conferred on me," they say, "the favour which the Lord has vouchsafed to the meanest of his servants gives him great joy;" and again, instead of saying, "I take the freedom to present you with this curiosity," they say, "the servant takes the freedom to offer to his Lord this poor present;" and the answer is, "every thing that comes from the hands of such a good servant is of inestimable value."

Previous to a visit made to any person of quality, a billet is always presented to the porter, setting forth the name and rank of life of the visitant; and if he be of equal rank with the person whom he visits, he is received at the hall door by the latter, two of his domestics holding before him a large fan, which is removed upon the visitant entering the hall: it is then the ceremony begins, with many bendings of the knee, and bowings of the body, on both sides; complimenting each other with their respectful titles, and taking the right and left side of each other by turns. These ceremonies over, the guest is conducted to a chair, and when seated declares the occasion of his visit. After a short conversation tea is brought; and when that is over, they make their obeisance to each other, and take leave with much bowing on both sides.

Upon the birth-day of a considerable mandarin, people of the first quality assemble, and proceed in bodies to his palace, taking sweetmeats and other presents with them. Upon entering the hall they stand in rows, and make a most profound reverence: one of them then taking a cup of liquor, presents it to the mandarin, saying, "Behold the liquor which gives joy;" another with sweetmeats says, "Behold the sugars of long life;" and then others of the company repeat the same ceremonies.

A mandarin, who has rendered himself particularly eminent by his public services, hath still greater honour shown him. Doctors, and others of the literati, cause a garment of various colours to be made for him, and on his birth-day carry it to his palace, accompanied with music. When they enter the hall of his palace,

they present him with this fine garment, and request he will put it on: but the mandarin excuses himself, by alledging that he is by no means worthy of so great a honour, till persuaded by repeated solicitations, he at length suffers them to take off his upper garment, and clothe him with that which they have brought along; with them: the garment is afterwards put carefully by as a mark of great honour and distinction.

When a mandarin of inferior rank meets his superior, he instantly stops his sedan, and makes a most profound reverence; and if two of equal rank meet, they salute each other in their sedans, by crossing their hands, and raising them to their heads, which they repeat till they are entirely out of each other's sight.

When a man of quality gives an entertainment, there are as many tables introduced as there are guests invited, unless the great number of visitants render it necessary to place two at a table: these tables stand in a line on each side of the great hall, which is adorned with pictures, flower-pots, and china-ware; the tables being placed directly opposite to each other, the guests face one another as they sit: there are neither table-cloths nor napkins, but the fore part of each table is embellished with embroidered silk, and the whole of it handily japanned. On the tables are large dishes of meat ready carved, piled pyramidically, with flowers and citrons at the top of the table.

Previous to the company being seated, the master of the feast salutes them separately by crossing his hands and bowing; he then calls for a cup of liquor brewed from rice and wheat, and holding it up, makes a low bow to his chief guest, and walks out of the hall, followed by all his company; when in the court, he turns his face towards the south, and lifting his eyes to heaven, pours the liquor upon the ground, to shew that all his possessions flow from the Lord who reigns above. He and his company then return to the hall, and every one takes his seat as the master of the feast appoints.

The entertainment begins with presenting to each of his guests a cup filled with the above-mentioned liquor, which they take with both their hands, and lifting it up to their mouths, invite each other with a motion with the head to drink first: this ceremony concludes with their drinking altogether at the same time. Liquor is served two or three times, and in the interim dishes of meat are brought on the tables; for those before-mentioned, piled in pyramids, are merely for ornament. The meat, which is in dishes, is cut into pieces before it is brought to table: they have neither forks nor spoons, but eat with little ivory sticks. The master of the feast, on his knee, inviting the company to eat, they accordingly put some of the meat on their plates; and at every fresh dish they are requested, with equal ceremony, to eat, and at the same time they are obliged to drink, though only just as much as is agreeable to them. After several dishes have been served, basins of soup are brought, attended with very small loaves, which they break and put into the soup: then tea is brought, and afterwards fruit; but before the fruit is served, the lord of the house takes his guests into the garden, or some other place: in the mean while the servants are employed, some in carrying water for the guests to wash their hands, others in cleaning the tables, and others of them in preparing the desert, which consists of the richest fruits, sweetmeats, &c.

During these feasts it is very common for players to introduce themselves, who, bowing several times to the very ground, present the principal guest at the entertainment with a book, in which are written, in golden letters, the titles of several plays; but the head guest refers the choice to a second, the second to a third, the third to a fourth, and so on; but all refusing, he at length chooses a play that he imagines will best please the company.

The ladies are seated in another apartment, where, through a silk netting, they see the performance without being themselves seen. Between the acts the company are entertained with music, both vocal and instrumental: of the latter kind are basons made of copper, drums which they beat with flat sticks, and flutes of different sorts. About the middle of the play some of the actors quit the stage, or rather floor, covered

with a capet, and collects money of the company: and at all these ceremonious feasts, the servants of the house make a collection likewise for the master's use, to reimburse him in part for the expences of the entertainment.

These entertainments sometimes continue till midnight, when the respective guests depart with great ceremony, and their servants walk before their sedans, carrying large lanterns of oiled paper. The following morning cards are sent from every guest, acknowledging, in the politest terms, the favours they received the preceding evening.

The power of fathers over their children in this country is absolute, no age nor office exempting them from this jurisdiction; nor is the power of the mother less.

Hence the respect shewn by children to their parents. They speak little, and generally stand in their presence: on their birth-day and other occasions they salute them on their knees, and with their foreheads touch the very ground. This duty of filial respect is held in such high honour, that an emperor once having banished his own mother for some improper gallantries, was compelled by his subjects to recall her from exile, and to restore her to the rank of empress, from which he had degraded her.

If a father cites his son to appear before a mandarin, his own testimony is allowed sufficient for the conviction of the accused, without any corroborating circumstances.

If a son attempts the life of his father or mother, his body is cut to pieces and burnt: if he leaves any house or dwelling-place behind him, it is razed to the ground, and a monument erected in the place to perpetuate his infamy: even the house or houses adjoining to it are also levelled with the earth.

Next to the duty of filial obedience, there is nothing held more sacred in China than that of the subject to his prince: in short, these two important duties being considered as having so near a relation with each other as to admit hardly of any distinction, rebellion is punished with the same degree of severity, and in the same manner as parricide.

It is customary for the Chinese to give their magistrates the title of father, and it is the pride of the emperor to be styled the great father, or guardian of his people. This noble and laudable prejudice is grafted in the hearts of the Chinese, and is become one of the grand pillars of their constitution.

No people on earth are prouder of their pretended grandeur than the Chinese: even the meanest amongst them have a contempt for other countries; and before they were visited by the European missionaries, they looked upon themselves so superior to the rest of mankind, that they treated all other nations as barbarians. They had conceived the most extravagant ideas of their own country, as to its extent; for supposing the globe to be in the form of a square, they imagined they possessed all the centre, and other nations only the four corners. It was with astonishment they found that beyond the seas, there were nations skilled in all the sciences, and even in many arts, to which they were themselves entire strangers.

When P. Chavagnac shewed them a map of the globe, they desired him to explain it to them, for they were totally ignorant of the delineation of it. "This," says the father, is Europe, this Africa, and here is Asia: in Asia you see Persia, the Indies, and Tartary." "But where is China?" said they. "Here it is," replied the priest, "don't you see it? 'tis in this little corner of the map." Upon which, overwhelmed with amazement, and looking at each other, they said, "it was little indeed." But they were still more surprised when some European artists shewed them clocks, watches, and mathematical instruments; and they then acknowledged that the Europeans were not that barbarous people they had always thought them.

But though the Chinese have been undeceived in their most flagrant errors, they have, even at this time, their strong and violent prejudices; there is not any nation more vain and intoxicated with the conceived preference due to their own country, or their superiority over others: they will not allow any thing to be excellent

that is not of their own produce. Though they might reap improvement from our artificers, yet they think it beneath them to imitate the Europeans in any thing; nor have we yet been able to prevail upon them to change the awkward structure of their vessels, though they have models continually before them.

It is an established maxim among the Chinese, that a king should possess the same tenderness for his subjects, as a father does, or at least ought to do, for his children; and that the father of a family should, in his own house, exercise the authority of a king.

Though gaming is strictly forbid in China, the natives play till they sometimes lose their houses, estates, and even their children and wives: and there is one most shocking custom here; when a man has more children than he thinks he can well provide for, the midwife receives orders to drown the next infant, or throw it into the streets.

When the missionaries were in China, visiting some of the populous cities, they sent their catechists out every morning, to baptize the infants as they lay expiring in the streets.

In the same manner as intriguing is carried on in other countries, courtship is conducted in China: there are certain women fixed upon for the business of procuring husbands for maidens; for as the latter are kept confined in their apartments, and the young men who are to be their husbands are not allowed to see them till the day of marriage, they are under a necessity of relying entirely upon those women, or confidants. The young people are never suffered to treat upon the subject of their nuptials; the parents settle every thing themselves; and though in other countries it is the custom for women to bring portions to their husbands, here husbands pay a sum of money to the parents of the bride, which is generally laid out in cloaths, &c. for her: then follow certain ceremonies, the chief of which consist in the relations on both sides sending to demand the name of the intended bridegroom and bride, and in making them presents. The relations of the bride, who determine the day of the nuptials, frequently consult the calendar for a fortunate day: mean while the man sends his intended bride some jewels, pendants, and the like. At least this is the custom with wealthy people.

No sooner are the articles of marriage settled, than the parents of each repair separately to a private chapel, where the sacred table-book there deposited, containing the names of the family to the fourth generation, and making a profound obeisance to it, the father of the family burns incense, and invokes the souls of his ancestors, which, according to the superstitious belief of these people, hover continually about this sacred book. He now imparts to his family the intended nuptials, reading the articles proposed and agreed upon, which are on a sheet of paper in letters of gold; after which he throws the paper into a pan of burning incense; and when it is consumed, he takes leave of his ancestors, and puts aside the sacred table-book.

When the wedding-day arrives, the bride is put into a sedan magnificently adorned, and her baggage of cloaths, ornaments, and trinkets, are carried after her in chests, by the domestic servants, and other persons hired on purpose, who also carry lighted flambeaux in their hands, though it be noon day: the grand sedan is preceded by music, and followed by the relations and friends of the bride. The nearest kin carries in his hand the key of the sedan (for the windows of it are grated up and locked) and gives it to the bridegroom as soon as the procession reaches his house, who waits at his own door, dressed, in order to receive her: and as this is the first interview between him and the young lady, it is easy to conceive with what eager curiosity he unlocks the door of the sedan. Some, dissatisfied with their lot, immediately shut the door again, and send the poor girl back with her relations, rather than to lose the money they have given, than to be united with a person they do not like; this, however, is rarely the case.

As soon as the bride steps out of her chair, the bridegroom presents his hand to her, and leads her into a hall, where a table is brought for them in particular, the rest of the company sitting at other tables, the men

in one apartment of the hall, and the ladies in another; but before the bride and bridegroom sit down, they make four reverences to Tien, a supposed spirit presiding in heaven; they also wash their hands with their backs to each other, so that one faces the north and the other the south; after which the bride makes four reverences to the bridegroom, and he returns two to her. When seated at table, they pour wine on the ground before they begin to eat, and set apart some of the provisions for their household gods.

The moment each of them tastes of the victuals on table, the bridegroom rises up and invites his lady to drink: upon which she rises also, and returns him the compliment; then two cups of wine are brought, of which they drink part, and pour the residue into another cup, out of which they both afterwards drink alternately; and this last part of the ceremonial ratifies their nuptials. The bride then goes among the ladies, and spends the day with them, while the bridegroom treats his friends in a separate apartment; and at night the couple repair to bed.

According to the Chinese law, no man, except the emperor, can marry more than one wife; he, however, has the privilege of taking as many concubines into his house as he pleases; but these must be obedient to the wife, and treat her as their mistress; though their children are not deemed bastards, but share the father's estate or fortune in common with those of the lawful wife, who permits them to strike her mother, and uses them as she does her own children. The emperor has three wives; and the number of his concubines is estimated at about three thousand, who are called Con-ngu, or ladies of the palace.

If a wife elopes from her husband, she is sentenced to be whipped, and the husband may dispose of her as a slave; if she marries another man, the first husband can cause her to be strangled. If a man quits his wife and family, the wife, after an absence of three years, has the privilege of presenting a petition to a mandarin, laying open her situation; and the mandarin, in such case, can authorize her to take another husband; she, however, would be very severely punished, were she to marry without this previous mode of application. In certain cases a man may put away his wife: thus for instance, divorcing a wife is allowed of, not only for adultery, but for a bad temper, a clamorous tongue, disobedience, theft, barrenness, or indeed for any contagious disorder: but though the law on these occasions authorise a divorce, it is seldom put in force amongst persons of condition; there are indeed examples of it among the lower orders of the people. Some of the men are so cruelly jealous, that they will scarce suffer their wives to speak in private, even to any of their near relations of the male kind.

As to the funeral ceremonies of these people, a great personage is always buried with a peculiar solemnity and pomp: they first wash the corpse, and after embalming it, dress it in the richest robes, and then expose it to view in a raised alcove, before which the wives, children, relations and friends, prostrate themselves; near the coffin stands an image of the deceased, or else some carved work, with his name in large characters, and surrounded with flowers, perfumes, and flambeaux.

The coffin is made of precious wood, varnished and gilt: and here it is necessary to remark, that the Chinese like to have their coffins made in their life-time: even the poorest among them will find means to be at this expense.

Before the corpse is put into a coffin, a quantity of lime is strewed at the bottom of it; and when it is closed up, they throw a white pall over it, and place it on a kind of altar in an apartment hung with white, where sometimes it remains many months, and incense is from time to time burnt upon the altar.

The sons of some of the great men, to shew their regard for the memory of their deceased fathers, will keep their bodies in their houses unburied even two or three years; and this sacred filial veneration proceeds from the extensive and absolute authority which the father had exercised over the son; for the father is not only master of his son's estate, but also of his concubines and children, who, whenever they offend him, he may

sell and enslave. The son, therefore, from a motive of policy, if not altogether from affection, may perhaps pay this peculiar tribute of esteem; for he may have a son of his own, and then the example is well judged.

On the day appointed for interment, the relations and friends of the deceased all meet at the house, and attend the corp. to its burial-place. The procession begins with a great number of persons carrying little pasteboard figures, representing slaves, tigers, eunuchs, camels, horses, &c. then follow a number of people, walking two and two, some bearing an altar, some playing doleful airs on musical instruments, and others tinkling little bells, or carrying perfume-pans, or pans of burning coals; in some parts of the procession the picture of the deceased person is held up, under which are written in golden letters his name and titles. At length comes the coffin under a grand canopy, made of violet-coloured silk, with tufts of white silk at four corners of a litter that bears it. The litter is borne by forty or fifty men; and the sons of the deceased walk with wands in their hands, with their bodies bending forward, as if ready to drop to the earth with their load of sorrow. Then come the sisters of the young gentlemen, and the wife and concubines of the deceased; but these are in sedans; and though they are not seen, they are sufficiently heard, for they cause the air to resound with their lamentations.

The burial-place is always out of the town in a sort of grotto built on purpose; for they are prohibited from interring their dead within the walls of cities or towns. The grotto consists generally of three rooms, each with a door, and a roof raised sloping back at the four corners. These grottos or sepulchres are built, if possible, upon eminences, or else on terraces raised on purpose, and are surrounded with little groves of pines or cypresses.

Upon the arrival of the procession at the sepulchre, the coffin is placed in a vault, and perfumes are burnt; the figures of pasteboard are also burnt, and libations and meat-offerings made to the deceased; for these people have an idea, that the spirits in the other world receive the offerings thus made, and that the different representations of the pasteboard figures become realized for their use and emolument.

The mourning of the Chinese is white, which is worn three years for a parent; wives mourn three years for their husbands, but husbands only one year for their wives. Children, mourning for their parents, wear coarse white cloth the first year, a better sort the second year, and the third year white silk if they please. The first hundred days are spent in solitude, lamentation, and abstinence: and during the whole period of their mourning, they are forced to refrain from feasting or holding any public employment: even a mandarin, on such occasions, quits all public business.

These people are so bigotted to a superstitious veneration for the dead, that they despise foreigners for abandoning the sepulchres of their ancestors, and exposing themselves to the hazard of dying in a remote country, without having relations with them to pay them the last tribute of affection.

As to public festivals or rejoicings in China, the two principal are celebrated, once in the beginning and the other about the middle of January. The former is kept in visiting, feasting, making presents, &c. That of the middle of the month is called the feast of the lanterns, when every family, both of city and country, on the sea-coast, or on the rivers, light up large painted lanterns stuck full of wax candles or small lamps, representing cavalcades, ships under sail, armies engaging, horses galloping, spectres, mimics, and other objects; these representations or pictures are set in motion by persons concealed, by means of strings or pulleys that at a distance cannot be perceived.

According to P. le Comte, these lanterns consist in general of six panes or sides, each making an oblong square four feet high, and one and a half broad; they are made of wood very neatly varnished and gilded; on each square is spread a fine transparent silk, painted with flowers, shrubs, rocks, and other objects, which are executed with so much judgement, and in such a diversity of colours, that they exhibit a most curious and striking

striking appearance. Sculptured figures form the crown of the work, from whence suspend silken streamers of various colours, contrived to fall on the sides of the lantern so as not to intercept any of the light, nor to hide the painting; for the candles or lamps within hide are very numerous, and diffuse a most agreeable splendor. Some of these lanterns measure twenty-five or thirty feet in diameter, and contain illuminated dragons from sixteen to twenty or more feet long.

Some Chinese doctors have asserted, that this feast of the lanterns originated from the hanging up lanterns in the ruins of the palace of Ki emperor of China. This prince had extraordinary talents; he was courageous, learned, polite, and affable, and had withal such extraordinary strength, that he could separate bars of iron with his hands; he, however, grew shamefully dissipated and effeminate, and spent prodigious sums of money in ridiculously erecting a tower, adorned with gems, to the memory of one of his concubines. These and other excesses alarming his courtiers, they most humbly remonstrated to him on his misconduct; for which he caused them to be put to death. One day, however, reflecting on the shortness of the period of man's life, and addressing himself to his queen, of whom he was passionately fond, he said to her, "There is nothing in this life that could so highly, so completely delight me, as the capability of rendering thee eternally happy; but, alas, in a short, far too short a time, our pleasures must end, and we be for ever separated. The dreadful thought, that my whole imperial power cannot give thee a longer life than even my meanest vassals hope to enjoy, strikes daggers to my soul, and makes me wretched amidst all the splendors of my reign. Why have not I power to make thee live for ever? Why cannot I immortalize my queen? While there are stars in heaven which never cease to shine, must thou be snatched away by death? Must all thy beauty and delicacy be laid low in the earth?"

"Live then, my liege," replied the queen,—"live as if thou wert never to die. Forget that life is short: lose all thought of it. What are the sun, the moon, and other planets to thee, or to me? We have no need of them to measure the duration of life. Erect and enlighten an heaven of thine own! Raise a stately palace, and shut it for ever from the sun! Let not a single beam ever dart into it! not a glimmering of nature's light let there be ever seen in it! No; hang up magnificent lanterns that shall outline the sun, and every star in heaven!—We will revel in this new creation of our own!—we will forget the succession of day and night!—we shall have one eternal day!—Be thou ever passionate and constant to thy queen!—her happiness will then be unchangeable, and will appear to thine eyes as lasting to eternity."

The emperor built the palace, and adorning it as the queen advised, both of them lived the shameful life they had proposed; when the populace, enraged at their design, conspired against him, by inviting a neighbouring prince to depose him.

The emperor, however, aware of the conspiracy, came forth from his illuminated palace, and headed an army, to oppose the designs of his adversary; but soon finding himself abandoned by his people, he took to flight, and wandered from province to province, under continual apprehensions of being discovered and taken into captivity. In the mean time the magnificent palace was pulled to the ground, and lanterns were hung up in every part of the city to perpetuate the event.

Others, however, have given it out that this grand anniversary festival has its origin from the following circumstance: a certain mandarin, in former times, who was greatly cherished by his people, having an only daughter drowned by falling into a river, he looked for her a whole night by the light of lanterns, all the inhabitants of the district following him with lanterns and torches to assist in searching for the lady.

The particular affection which the people had for their mandarin, or else the singularity of the adventure, set them to work with their lanterns the same night of the year following; and this custom gradually spreading, occasioned in time a public festival throughout the empire.

S E C T. IV.

Chinese Agriculture, Husbandry, &c.

IN China there is a festival for the encouragement of agriculture, at which the emperor himself presides. Every spring, after the example of his ancestors, this prince goes in great pomp and solemnity into a field, and ploughs up a few ridges of land, by the way of encouraging and animating his peasants in the business of agriculture; and the mandarins go through this same ceremony in their respective provinces.

As soon as the emperor is in the field, he makes an offering to the god Chang-ti, and implores him to prosper the fruits of the earth. When this is done, his Imperial Highness, with the princes and great men of his court, proceed towards the plough; some of the grandees carrying a rich chest containing the grain to be sown, while profound silence is observed. The emperor laying hold of the plough, and using it for some little time, resigns it to one of the princes, who also ploughs, as do others after them. As soon as several places have been ploughed, the emperor sows the grain, consisting of rice, wheat, millet, beans, &c. and the next day the proper husbandmen finish the grain, whom the emperor honours with a present of four pieces of dyed cotton for apparel. And, as a further encouragement to agriculture, the farmer who most distinguishes himself in cultivation, is constituted a mandarin of the eighth order, and accordingly wears the habit of a mandarin; he has also the privilege of paying a visit to the mandarin of a city, and to sit down in his presence; and when he dies, great honour is paid to his obsequies.

There is another festival, the chief ceremony of which consists in carrying about the country a monstrous cow with gilded horns: this cow is formed of clay; and behind it walks a little child, with one foot bare, beating the cow with a rod, as if to make her go on. This festival is celebrated by country people and labourers, who carry or drag after them their several implements of husbandry. A company of comedians attend them, playing all kinds of antics. Thus they proceed to the palace of the mandarin or governor of the district, where they break the cow in pieces, and take out of her belly a great number of little cows formed also of clay, which they distribute to the multitude; and the ceremony concludes with a speech in praise of agriculture, pronounced by a mandarin himself. Some of these cows, which are considered as emblems of labour and industry, are so large and heavy, that forty men can scarce support them.

As to the proficiency of the Chinese in agriculture, they bestow great pains in manuring their lands, and collect together the hair of hogs, or any other kind of hair they think will manure and strengthen the ground. Barbers are careful to preserve human hair, which they sell to the farmers.

The cultivation of rice is the principal object of the husbandmen: they at first sow their grain indiscriminately; but as soon as it has risen to the height of about a foot, they root it up, and plant it in proper order. But before this they smooth the earth with a wooden machine, and give the fields a most agreeable aspect.

Rice indeed is the daily bread of the Chinese, and grows in such plenty here, that both Europeans and others provide themselves with it at a very cheap rate. If there is a famine, the people run by thousands to Canton, where they can get their livelihood better, and may live upon rice grits for one penny a day.

A Swedish gentleman, who lately visited this country, observes, "Of the empire of China we may justly say that it can exist by itself; its situation is so happy that its northern parts are no more incommoded by the cold, than the southern ones are by the heat; both are temperate, and produce all kinds of plants. The southern parts bordering upon the sea, are low, wet, and suitable for rice, which is the principal food of the inhabitants. I have been told, that the farther you go north, the more you find the culture of rice decreases, and that rice, barley, wheat, beans, &c. are cultivated instead of it. Every twelfth hour the tide is upon the land near Canton, and leaves behind it a
fine

slime which makes the soil fruitful. The ebbing tide retires at first slowly, consequently the saline slime settles itself, and becomes manure to the fields as soon as the water has left it. In order to get manure, the poor gather the excrements of men and beasts in the streets, and about the houses: these they sell to dealers, who again sell it to the husbandmen; and, for the same use, they collect urine in proper vessels. Millions of Chinese live by economy and industry, reducing the hills into plains, or at least making use of them as plains by terraces, whose height and breadth are adapted to the declivity. The terraces, which are sometimes four or five feet above each other, they plant with several trees, whose roots, twining together, keep up the borders, and the trees themselves shelter the plants from winds."

The Swedish gentleman, from whom the above quotation is taken, brought a tea-shrub to Sweden, on the 3d of October 1763, which was the first that ever came late to Europe.

S E C T. V.

Of Porcelain and Silk; Natural History of the Silk-worm; Paper and Ink Manufactories; Method of Printing, &c.

Porcelain, or china ware, is made of the Pe-tun-tse and Kao-lin, the former of which is a fine white earth, and the latter an earthy kind of stone with bright particles like those of silver. After they have washed and purged the stone from its sandy and foul matter, they break it into pieces with hammers in mortars, and with stone pebbles reduce it to a fine powder. These pebbles, which are capped with iron, are worked perpetually, either by man's labour, or by means of water, in the same manner as the hammers of paper-mills. The powder is put into a vessel, and briskly stirred about; when, after it has rested a few minutes, a thick cream rises on the surface, which they take off and pour it into a second vessel of water; this cream is not less than four or five inches thick. The gross part of the powder that remains in the first vessel they take out and pound afresh. With regard to what is put into the second vessel, they wait till it has formed a kind of paste at the bottom; and when the water is clear, they pour it gently off, and cast the paste into large moulds, in which it is dried. It is remarkable, that neither the Pe-tun-tse nor Kao-lin are to be got in the neighbourhood of King-te-tching; they are obliged to fetch them from the province of Chan-li, twenty or thirty leagues off, where the inhabitants know not how to use them: of these are made cups and vases of various kinds, sizes, and colours: some red, some yellow, some grey, some blue, and others white, but none of a perfectly black ground: red and sky blue are the most common colours. They use all colours in painting their china ware; some quite red with small spots, others entirely blue, others streaked or chequed with squares, like mosaic work, which is reckoned amongst the most beautiful. Some of their china is mixed with various colours, like jasper; and some is adorned with flowers, landscapes, dragons, and frequently human figures. These figures are often reliefs, which is thus effected: they first delineate the figure with a pencil, and then pare down the contiguous ground, so that it appears raised or embossed on the superficies. They make every kind of representation in this sort of ware, as idols, animals, &c. Many of these figures known in Europe, by the name of Chinese baboons are images of the gods they worship.

One kind of earth they make use of in the composition of their china ware, is a sort of chalk, of a somewhat glutinous and soapy nature: it is washed well, in order to take off a yellow earth sticking to its surface. It is prepared in the same manner as the other; and the most valuable and beautiful china is made by properly embodying eight parts of this chalky substance with two of the other earth; after which the vessel is turned on a wheel, placed on a round board, which is set in motion by another wheel under it, turned by the foot. Large pieces, such as urns, &c. are made at twice, one part being raised on the wheel by two or three men, in order to receive its proper form; and the other half,

when formed and nearly dry, is incorporated with it by the same matter it is made of, moistened with water. When the pieces united are dry, the places where they are joined are scraped and polished with a knife, both on the inside and outside. Spouts, handles, &c. are fixed by the same means. Grottesque figures, busts, idols, &c. are made in moulds, and then joined together. Flowers, and such ornaments, are formed on the china by stamps and moulds; and reliefs, ready prepared, are stuck on. When they have the model of a piece of porcelain that is bespoken, and which they cannot imitate by the wheel only, they use a sort of yellow fat clay, which they knead and apply to the model; and as soon as the impression is taken off, they separate the mould from the model in several pieces, and very gently dry it. When they intend to use the model, they place it some time before the fire; then they fill it to a proper thickness, pressing it all over with the hand; after which they again place it a short time before the fire, whereby the mould is loosened by the moisture being dried up that before cemented the one to the other. The several pieces, thus separately made, are again united in the same manner as the large china vessels; and the figure becoming hard, it is afterwards completed.

The whole process of painting the porcelain is long and laborious, and employs a great number of hands: it is the business of one to make the coloured circle near the edge; another traces the flowers, which are painted by a third; a fourth is employed in the formation of birds and other animals; a fifth forms rivers, rocks, &c. and a sixth is engaged in the figures of men and women.

It is a pity their workmen do not understand the art of designing a little better; for though they acquire themselves tolerably well in drawing flowers, and in some other imitations, yet their representations of animals are, for the most part, very awkward figures: this must be either the effect of ignorance in the rules of symmetry and proportion, or must proceed from an affectation of the grotesque.

P. le Comte says, the Chinese disgrace their country by the absurd portraits which they give of themselves; since an European, who never saw them, would imagine that they resembled those apish figures which are drawn upon their screens and china ware.

It has been the opinion of the best authors skilled in oriental antiquities, that silk-worms and silk originated in China; from thence they passed to the Persians, from the Persians to the Greeks, and from the Greeks to the Romans. Certain it is that silk is so common in China, that none but the meanest of the natives appear in any thing else. The silks most esteemed either for richness or beauty, are the nan-king damasks of various colours, satins, taffeties, brocades, gauzes, &c. These, when quite new, have a very fine and handsome appearance; but their beauty soon fades. A strong durable satin called Touan-tse is much esteemed; it is sometimes plain, and sometimes figured with representations of birds, trees, flowers, and particularly dragons; for the figure of a dragon is a very favourite representation with the Chinese, on account of the peculiar veneration they have for the memory of a celebrated dragon, which, agreeable to their fabulous antiquity, inspired their great legislator Fo-hi. These figures are not raised upon the silk after the European manner; the texture is even throughout, the figures being distinguishable by difference of colour, and not by their projecting from the ground of the silk, after the manner of basso relievo: these colours consist of the juices of herbs and flowers, which so effectually penetrate the silk, that the stain always remains in it; and so admirable is the deception, that the figures appear as if actually projecting from the ground of the silk.

Having thus far treated of the silks, we shall now say something of the silk-worm. The worm, when it leaves its egg, is no bigger than the head of a common pin; it feeds upon the mulberry leaf, and grows to the size of a caterpillar, after which it no longer eats, but prepares for its dissolution: it wraps itself in a kind of silken ball spun from its own bowels, and its head separating from its body, the insect now no way resembles its original form; it hath apparently neither life nor motion; however, after remaining in this

state some time, it awakes to a new being, and appears a different kind of insect. It resembles a large moth or butterfly; and in this last stage, the female propagates the species by laying a prodigious number of eggs, after which she dies.

This valuable worm is composed of several elastic fibres; from one extremity to the other it has a kind of little nerve, which we will call the spine; this spine, placed in the centre of its body, and continued through its whole length, admits two other nerves or strings: one of these is the heart, which is composed of many oval vessels; the other, which is the lungs, is double, and appears to be an assemblage of several ribs extending towards the two sides of the insect, and between which are certain orifices that correspond with those diffused along the exterior side. It is through these apertures that the air flows to the lungs, and by its firing and expansion promotes the circulation of the chyle or humour which nourishes the insect.

It is necessary to add, that the worm is perfectly black when it first comes out of the egg. In a few days it begins to assume a whitish hue, or all grey; after this its coat fulfies, and becomes ragged; at which time the insect casts it off, and appears in a new habit. It increases in bulk, and becomes more white, though a little inclining to a bluish cast; then divesting itself of its skin, it reappears in its third habit; when its colour, head, and whole form are so metamorphosed, that it appears quite another insect. In a few days it becomes changed to a bright yellow; so that, from the time of its leaving the egg, it hath assumed half of three different coverings. It continues feeding a short time longer, and then renouncing all society, wraps itself in its little silken ball as already mentioned.

The gum, of which this curious insect makes or spins its nest, is separated from the other juices which nourish the creature; it at first seems to labour without design, and forms only a sort of flue or down; this is its first day's employment: on the second it begins to form the outside of the cone or bulb, in the middle of the loose flue or flue made the day before; and on the third day it is entirely obscured. In the space of a week the cone is completed, and the worm changes to a chrysalis, wrapped in its little silken tomb, without test, light, or any distinct part. The cone is like a person's ear, and is more pointed at one end than the other. A female silk worm sometimes lays five hundred eggs.

The Chinese have two methods of bringing up their silk worms; they either let them to range on the mulberry-trees, or keep them in rooms; but the latter method is productive of the finest silk.

According to the Chinese chronology, the introduction of paper into that empire was about the second century of the Christian era, which pretty well agrees with the time of its first being first known in Europe. Prior to this invention, or at least the introduction of it, the Chinese used to express their sentiments by the means of carved letters, or rather hieroglyphics, which were cut into blocks of wood; and these boards, or wooden leaves, being fastened together, formed books. Some of these we are informed, with the character of Confucius, are to be found at this time in China; they are the most valuable reliques by the Chinese and others.

As the first way of writing of this kind could not however be continued from its tediousness, on which point the Chinese soon adopted another method upon pieces of silk and linen, cut into different sizes, and called by the name of paper books or volumes; but the oldest of these is a curious and ingenious manner, even still in use, made of the bark of trees. The trees, which are chosen were the mulberry, bamboo, oak, and cotton; but they use only the second bark of the bamboo, which is left and white; this is steeped in running water, then washed clean, and spread in a dry ditch, where it is covered with lime; and left to rot, until the fleshy part is separated into vessels, and dried in the sun. It is then boiled in a caldron, and afterwards reduced to a pulp by a machine. Some say they take some water, in which the branches of the knot-tree, a shrub, hath been soaked, in order to make it soft, and mix it with the matter the paper is made of.

The whole then becoming a clammy liquid, and being poured into large reservoirs, they, with their proper moulds, take up the surface of the liquor, which in an instant almost becomes paper. The moulds are long and broad, and the bottom made of threads of bamboo, so that there are sheets ten, twelve, or perhaps thirteen feet in length. They afterwards dip every sheet of paper into alum-water, when it has the denomination of fan-paper; for in the Chinese language, the word fan signifies alum. The ink is prevented from sinking in the paper by the alum, which besides gives it an agreeable lustre. The paper is in general full as white, and is finer, and much softer than any we have in Europe, but it is more apt to crack, as well as to become damp and worm-eaten; and, if not very carefully preserved, it is less durable. That made from the bamboo is more subject to crack than any; though perhaps the dipping it in alum-water may in general occasion this defect. The paper made from the cotton-tree is the most delicate, and most generally used, for it is as durable as any European paper.

Chinese, or what is commonly called Indian Ink, is the composition of a great number of ingredients, and there are several methods of preparing it. Some of the ingredients which they make use of are, oil, suet, hog's-grease, lamp-black, &c. qualified with a mixture of amber, musk, and other perfumes. When these ingredients are all properly mixed together, and formed into a paste, they are put into wooden moulds, made so as to form masses of different figures. These are in the shape of a book, and others resemble animals; though generally they are fashioned into sticks of different lengths, marked with Chinese characters, and often embellished with blue, green, and other coloured flowers. The shining black is the most esteemed ink, and is made from the best oil.

Ink-making is reckoned a very reputable employment in China: it is even ranked among the liberal arts, on account, undoubtedly, of its utility to the sciences. In the city of Hoon-tcheou, famous for the finest ink, the ink-makers have several small apartments illuminated up both day and night with lamps.

The Chinese do not write with a reed like the Arabians, or with a crayon like the Egyptians, or with a pen like the Europeans, but with an hair pencil. They make use of a piece of polished muslin, hallowed at one end to hold water, wherein they dip their stick of ink, and then gently rubbing it, trace is in a few moments produced a fluid ink. They do not hold their pencils dipping as we do our pens, but perpendicular to the paper: they write from top to bottom in columns, and begin their books where ours end; that is, they begin at the right hand side of the paper, and proceed to the left, like the Hebrews; but their paper being very thin, it will not bear writing on both sides of it.

Their method of printing is not at all like ours. They lay claim to the invention of this art, at least four hundred years before it was practised by the Europeans.

As we have but twenty-four letters, and these are capable of composing whole volumes, it is not necessary that the compositor have more than a quantity of these characters sufficient for one complete body or frame (or form, as it is called in a printing-office), because when a proper number is printed, he distributes his types into their respective boxes, and with the same letters composes a fresh form or frame; so that a very large book may be printed with a moderate number of characters. But the Chinese, who do not practice this most useful and admirable method, are under a necessity of using a prodigious number of characters, as they have properly no letters, but different marks for all the different words in their language. Instead of types, they cut their characters on wooden blocks. When an author is about to print his manuscript, he gets it fairly transcribed on fine transparent paper; then the engraver draws each letter upon a smooth block, with the face of the type to the wood, and then cuts away the wood, leaving only the types; which is effected with such a degree of nicety, that, when printed off, they so exactly resemble the original, as to render it difficult to distinguish the print from the hand-writing. This method of doing business, it must be allowed, is subject to great inconveniences, on account of the necessity of multiplying

multiplying the number of blocks of wood, and the length of time taken up in engraving; and, as the pages are separately worked off, it must be a long time before a volume can be completed. But then, on the other hand, it is to be considered, that the Chinese engraver works his characters almost as fast as the European printer composes his. This could not, however, be supposed to be done, without considering that the Chinese characters are a sort of short-hand, some of which not only express words, but whole sentences. Moreover, when the whole copy is engraved, the author can order to be printed only just such a number of books as he thinks he shall have occasion for; by which means he consequently avoids that loss which European authors and booksellers sustain from the number of superfluous printed copies.

On some occasions, particularly in the printing a public ordinance, the Chinese make use of moveable characters; and sometimes, for greater expedition, they spread a coat of wax on a wooden frame, and so cut the characters with their graving tool.

They have no preless as we have in Europe; for their paper would not bear the weight and pressure of those machines: but when once the blocks are got ready, and the paper prepared, a single man with a brush can print a great quantity of sheets in the course of a day; nor is it their custom to wet their sheets, but they spread them on dry frames, and so take off the impression. They have a couple of brushes, one harder than the other; they dip one a little in the ink, and then rub the surface of the block with it, so as to wet it neither too much or too little; for were it too wet, the character would of consequence be blotted, and if not sufficiently so, no impression could be made. When they have thus properly inked the characters, they lay the sheet upon the block, and then gently pass the other brush over the paper, pressing it so as to imbib the ink.

As the Chinese can only write, so can they only print, on one side of their paper; for otherwise, on account of the thinness and transparency of the paper, the characters would run one into another, and confuse the whole. In order to obscure the blemishes occasioned by the sinking of the characters on the reverse of the paper, each sheet is double, and stitched by the binder on that side where the leaves open, and not on the folding edge. Their books are in general bound either in silk, stuff, or in pasteboard.

The printing ink is made of lamp-black, well beaten and exposed to the sun, and then sifted through a fine sieve: afterwards it is tempered with aqua-vitæ, and mixed with water, till it becomes of a proper consistence. To every ten ounces of ink is added about an ounce of glue, which is dissolved over the fire, and mixed with the lamp-black and aqua-vitæ before it is tempered with the water.

The Chinese are extremely ingenious in their performances in amber, ivory, coral, chony, shells, &c. and their public buildings are another testimony of their elegant taste: in short, they discover great abilities in every art that tends to promote the public welfare.

SECT. VI.

Sciences of the Chinese; their Medical and Medical Knowledge, Dramatic Entertainments, &c.

THERE are but few of the Chinese who apply themselves to any of the speculative sciences; moral philosophy hath always been their primary study, and this they reduce to two principal heads, viz. the reciprocal duties between parents and children, and between prince and people. Between polity and morality they make no distinction; the art to govern well, and the art to live well, are with them one and the same principle.

The sages of China have produced the most excellent moral books, and have suited their stile and tenets to the most ordinary capacities; studying more to instruct the uninformed, than to acquire applause to themselves. Learning is there the only path to preferment, and none but the liberal are governors of cities and provinces.

The libraries of China are numerous, elegantly

built, superbly ornamented, and enriched with grand collections. It is by the study of morality, of history, and of the laws of their country, that the degree of doctor is obtained, which is soon followed by the acquisition of a government.

Above three thousand years passed from the Mosaic account of the creation before the Chinese had any commerce with the polite or learned nations of the globe, or at least such as choose to give themselves that appellation, for the Chinese are very little behind ourselves in the most capital degrees of refinement. But without our assistance they were in possession of most arts and sciences; great therefore, consequently, must ever have been the genius of these people. Since the period of the decline of the Grecian empire, the liberal arts have been transmitted but slowly to the Italians, French, English, and other polite countries; but the Chinese were acquainted with them so early, that the sciences may be deemed natives of their country, they being so far from standing indebted to Greece for them, that they are entire strangers to the learned languages, and have not the smallest historical traces of the Greeks and Romans. However, on the other hand, we must consider what little progress the Chinese have made in these arts and sciences, and to what a degree of perfection the Europeans have carried them during the last three centuries.

The Chinese have applied themselves with great diligence to astronomy. Their Chu-king, a canonical book of great antiquity, sets forth, that in the reign of the emperor Yu, which was more than two thousand years before Christ, there lived Hs and Ho, two noted astronomers, who, however, were in very great disgrace for not prognosticating an eclipse of the sun which happened in their life-time. In the same book mention is made of another eclipse of the sun that happened two thousand one hundred and fifty-five years before the Christian era; the truth of which stands confirmed by the calculation of the jesuit P. Schaal. Gauthier the jesuit has observed, that from above an hundred and twenty years before the same era, they have given the number and extent of their consultations, what stars answered the solstices and equinoxes, the declination of the stars, the distance of the tropics and the poles. He adds, they were acquainted with the motion of the sun and moon, and also of the planets and fixed stars, though they did not determine the motion of the latter till four hundred years after Christ.

Confucius, who wrote the history of his country two thousand years ago, takes notice of thirty-six eclipses of the sun, all of which, according to the calculations of the jesuits, have been found to answer to the period assigned them by that learned historian, except four, two of which were solar, and the other two lunar; and the Chinese are at this very day possessed of several astronomical books, which they almost were composed under the dynasty of Han, who reigned before the birth of Christ; by which it appears that these people, for upwards of two thousand years past, have been acquainted with the solar year as consisting of three hundred and sixty-five days and some hours; the apparent diurnal motions of the sun and moon from east to west; the meridional altitude of the sun by the shadow of gnomons; the right ascension of the stars, and the time of their passing through the meridian; as likewise the revolutions of Saturn, Jupiter, Mars, Venus, and Mercury: and their observations, in these particulars, have been pretty near the same with ours in point of exactness, inasmuch as they have had no tables for the retrograde and stationary aspects of the planets. Ancient, however, as is their astronomy, they reason on this subject, according to Le Comte, as absurdly as the most ignorant: they imagine that the heavens are an enormous dragon, who is the professed enemy to the sun and moon, and ready at all times to devour them: as soon therefore as they perceive an eclipse, they make a most loud noise with drums and brass kettles, till the monster, alarmed, abandons his prey. Even the principal mandarins fall on their knees, and bow to the sun, striking the ground with their foreheads, by way of expressing their concern for the distresses of that poor planet; and, at the same time, implore the dragon not to deprive the world of so glorious a luminary. Thus doth custom prevail over the rational

tional faculties; and these ridiculous ceremonies are practised in all parts of the empire; though the learned know that the phenomenon of eclipses is the effect of natural causes.

At Pe-king there is a tribunal set apart for astronomical proceedings, consisting of numbers of mathematicians, five of whom are appointed to watch the motions of the heavenly bodies night and day, and to report to the emperor any new phenomenon they observe. A short time before an eclipse, the body of astronomers acquaint the emperor with it, mentioning the particular hour of its approach, as well as the degree and duration of it, and an account of it is stuck up in different parts of the city, by way of preparing the multitude for the awful appearance.

The astronomers compose annually a calendar, several thousands of which are printed, and an edict is issued from the emperor, prohibiting the printing and publishing any other whatever.

Their year commences from the conjunction of sun and moon, or from the nearest new moon to the fifteenth day of Aquarius, the sign which the sun passes through in January; and this is deemed by them the beginning of spring; the fifteenth degree of Taurus is the point determining the commencement of their summers; the fifteenth of Leo their autumn; and the fifteenth of Scorpio their winter.

Their year is divided into twelve lunar months, some of them consisting of twenty-nine, others of thirty days; and every five years they have an intercalary month to adjust the lunations with the sun's course. They reckon by weeks as we do, and in like manner give the name of a planet to each of the seven days, and according to the same order. Their astronomical day begins at midnight, which is divided into twelve equal parts, each answering to two of our hours.

The Chinese have not the art of making clocks; they have solar quadrants and other chronometers. Among other simple inventions in private use, for the purpose of measuring time, they have a little perfumed pafil of a conic figure, which they burn in the night: this pafil is marked, to shew the particular time it is made to burn, and hath generally five divisions, answering to the five watches of the night; so that those who wish to be waked at a particular time, hang a small metal ball by a string to the pafil, which at the time burns the string, and the weight falling into a copper basin awakes the person sleeping.

The first pieces of clock-work that were ever seen in China, were taken thither by P. Ricci, who presented the emperor with a repeating-watch, and a clock with chimers.

The Chinese are but slender proficient in geometry, being confined to a small number of axioms, and their not reduced to any regular system.

When the jesuit missionaries visited these people, they gave the emperor Chang-ki (that he might have an insight into optics) a semi-cylinder, with a convex-glass in the middle of its axis; which, directed to any particular object, delineated the image within the tube to a very great nicety. The emperor was delighted, and an object glass of much greater diameter was afterwards placed in his gardens.

Grimaldi made, in the jesuits garden at Pe-king, four human figures upon four walls, each wall near fifty feet high, and the figures as high as the walls. As he had nicely kept to the rules of optics, nothing was seen but forests, woods, mountains, and objects of this kind; but at a particular point was seen the complete figure of a well-proportioned man. The emperor beheld these figures with the greatest admiration, and crowds of grandes came every day to see them; but what most excited their amazement was, to observe the figures so proportioned and regular upon walls, that in many places were particularly irregular.

The emperor was presented with many catoptric instruments, and among other things a tube in the form of a prism, with eight sides, which, placed parallel with the horizon, exhibited eight different scenes in the most striking and animated manner.

They presented him likewise with another, containing a polygon glass, which collected into one image several

parts of different objects. They also exhibited a magic lantern, which highly delighted the emperor and his ladies.

In the gardens of the jesuits, three paintings upon cloth were shewn, representing houses, roads, villas, &c. seeming to extend as far as the naked eye could reach, and so naturally, that the emperor and his company were at the first sight deceived. In statics a machine was presented; by the help of which a child lifted with the greatest ease several thousand weight. Some pneumatic instruments likewise greatly excited the curiosity of the spectators.

As the skill of the Chinese in natural philosophy and anatomy is very superficial, it cannot be supposed they are acquainted much with physic; however, they pretend to have applied themselves closely to it even from the establishment of their empire: certain it is, they have some very excellent practical physicians, the greatest part of whose medicines consist of herbs, roots, fruits, seeds, &c. which are, for the most part, good stomachics and gentle purgatives. By the beating of the pulse they pretend to know the cause of any disorder, and in what part of the body it lies; and indeed, they have discovered pretty exactly, by this means, the symptoms of complaints. They say that the pulse of a man differs from that of a woman, and that it changes with the seasons of the year.

When they attend a sick person, they lay his arm upon a pillow, and then apply their fingers to the artery; at first they touch it gently, then a little closer, and lastly press it very hard: they take time to examine the beating, and distinguish the differences according as the motion is more or less quick, uniform or irregular; which they observe with the most attentive exactness: according to the variations, they pronounce what part of the body is affected, how long the disorder will hold, and whether the patient will get the better of it or not.

This sagacity of the Chinese physicians is truly extraordinary. They lay it down as a maxim, that a regular pulse beats four, or at most five times between every breathing or expiration of the air from the lungs; that if a pulse beats fix in that time, it is irregular; if eight times, the disorder is dangerous; if more than eight, mortal. They take with them frequently a chest of various drawers, separated into about forty small compartments well supplied with roots, simples, &c. but seldom prescribe bleeding. Some physicians take no chest with them, but only prescribe, and leave the patient to purchase of the druggists, who are in almost every city or town in the empire. There are fairs for the sales of medicines only, and one province buys of another what it does not itself produce.

The Chinese pretend to be the inventors of music, and boast of their having once brought it to high perfection: their concerts have no dependance on a diversity of tones, or a difference of parts. They have no musical notes, nor any sign to denote the variations which constitute harmony: they learn the tunes by the ear, and when these are played on the instruments, or sung by a good voice, they are not disagreeable even to a European.

When the fathers Grimaldi and Pereira played upon the harpsichord before the emperor in 1679, his imperial highness was exceedingly delighted, and expressed his inclination to learn to play on the instrument himself; he was accordingly instructed; and as he was one day playing a Chinese air, Pereira took out his pocket-book, and pricking down the tune, played it immediately after him: at which the emperor, amazed, asked the father how he was capable of learning a tune in so short a time, when the very best of his own musicians could not become masters of one without practising it several times! The missionary replied, that the Europeans had learned the art of noting down sounds upon paper, through the means of certain characters used for that purpose. The emperor then, to be more fully convinced, sung several airs, which Pereira pricked down also in his book, and then repeated them with the greatest accuracy. This was so satisfactory and pleasing to the emperor, that he acknowledged the European music to be incomparable, and accordingly instituted a musical academy, making one of his own sons president.

Thc:

These people have invented several kinds of musical instruments, some made of metal, others of stone; one hath some resemblance to our trumpet: they have some covered with skins, like our drums; they have wind instruments of two or three kinds, as flutes, and a sort of little organ, which yields an agreeable sound. They have likewise many sorts of stringed instruments, the strings of which are, for the most part, made of silk, few of them of gut; the generality of them consist only of three strings. They have one instrument with seven strings, which is in great esteem amongst them, and not disagreeable when played by a masterly hand.

As to the dramatic exhibitions in China, they have no public theatres; however, they have companies of comedians in almost all the principal towns, who travel about with a portable theatre and scenes, and attend the public entertainments given by the grandes. Their performances are commonly interlarded with songs and symphonies between the acts, with which the auditors are highly pleased. They generally present a list of thirty or forty plays, the shortest of which will take up three hours in performing.

S E C T. VII.

Of the Canals, Bridges, Roads, Temples, Triumphal Arches, Pagods, and great Wall of China.

THE most superb canal in China is the Yun-lean, or Royal Canal, which is a work far superior to any thing to be seen in any part of Europe, and divides China into two parts, north and south. Thus doth this celebrated canal open an uninterrupted communication between the two extremities of the empire; and all sorts of commodities may be conveyed with the utmost safety from Peking to Canton, about six hundred leagues distant.

Indeed, this and the other canals may justly be esteemed the noblest works in China, considering their extent, their clear and deep water, their being fenced on each side by banks lined with brick or marble, and their communications with different parts of the country; for over them are fine bridges, most of which have several arches, and that in the centre high enough for barks to pass under with their masts erect.

The bridges built over the rivers are of stone, and of very strong workmanship; some of them are very handsome structures, and of great length. Many are of a level ground, or instead of being built archwise, consist of large stones laid horizontally on single pillars; of this kind is the bridge of Suen-tcheou, in the province of Fo-Kien: it is built over an arm of the sea, and is supported by above three hundred pillars: its length is about two thousand five hundred feet, its breadth twenty; and the stone-work, from pier to pier, at the top, consists of large single massy stones.

In the province of Kocitchou there is a bridge called the Iron Bridge, which consists of chains of iron, reaching over a river extremely deep and rapid, though not very broad; on each bank are raised two massy piles of masonry, to which are fastened chains that cross to the opposite side, and on these are laid broad planks. In one province they fix poles of wood into the rocks, and on those lay broad boards; awkward, however, as these are, the country people pass over them without fearing any danger.

As to the high roads in China, the natives, by indefatigable toil and industry, have projected methods which the most scheming or adventurous Europeans could not have done: these roads are broad, commodious, well-paved, handsome, and secure. The high road in the province of Chen-si may be deemed a prodigy, it reaching over mountains and hideous precipices. Upwards of one hundred thousand men are reported to have been employed in the making this road, who levelled some of the mountains, formed communications by arches with others, and finished it with surpassing expedition. In some of the provinces the highways are bordered on each side with lofty trees, with resting-places at a convenient distance from each other; these resting-places are in the form of grottos, and afford shelter as well as rest. They are built by some old mandarins, who upon quitting their offices, and returning to their native provinces, recom-

mend themselves by works of this sort: and the convenience of these places is the greater, on account of their being but few inns upon the high roads, or indeed in the country; those, however, that are upon the highways, are in general handsome and commodious, but those on the lesser and more private roads are awkward and miserable places.

Amongst the most famous buildings of the Chinese are their triumphal arches, called by the natives *Pavilions*. The most celebrated of these monuments have been erected in veneration of the memory of great princes and warriors.

These arches have commonly three gates, formed by columns, the bases of which are without moulding or embellishment; neither have they capitals or cornices; the frieze is high even to an absurdity, to admit space for inscriptions, as well as borders of ornaments, consisting of birds, flowers, human figures, &c.

Their pagods or temples, erected to their fabulous deities, are very numerous: they consist in general of one tower, terminating in a dome: some are built of brick, and others of hard tempered earth.

The celebrated Porcelain Tower stands at a small distance from Nan-king, and is looked upon as the handiwork and grandest building in all Asia.

To convey to our readers a competent idea of the magnificence of this structure, we present them with the following description of it, as given by P. le Comte.

This famous temple, which by the Chinese is styled the Temple of Gratitude, is built upon a massy foundation of a rock, which forms a grand person encompassed by a bulwark of rough marble, which is ascended by a flight of ten or twelve steps on every side. The hall, which serves for the base of the temple, is an hundred feet in height, rising upon a basis of marble one foot thick, which extends beyond the wall, forms a border or raised way two feet in breadth all round the tower. The superstructure is ornamented with a gallery and pillars, with a tiled pediment, covered with green tiles of a very bright varnish. The entrance within the temple, and which has open to the light, is painted; it consists of a prodigious number of pieces of timber, differently boxed, and let one into another, which is looked upon as a noble and valuable embellishment in Chinese architecture. It must be acknowledged, that this labyrinth of beams, columns, girders, &c. has something in it striking and amazing, though in truth it is no better than a regular kind of embarrassment and confusion, proceeding from the ill taste of this nation for architecture, who are entire strangers to that noble simplicity so justly admired in our best buildings. The hall receives all its light through the doors, of which there are three towards the east: through these enter into the tower, which makes part of the temple. This tower is an octagon, forty feet wide, inclosed by an outward wall of the same figure, at six feet and a half distance, bearing a roof at a moderate height, which ends at a distance to project from the body of the tower, and serves for the floor of a handsome gallery. The tower consists of nine stages or stories, each of which is adorned with a cornice three feet high, and distinguished by a corbel projecting just beneath the windows, like the gallery below, though not so far, as it hath no second wall like that to support it, and they lessen in proportion to the increasing height, and narrowing of the tower. The wall of the tower is at least twelve feet thick at the lowest story, and above eight and a half at the top. It is incrustured with squares of porcelain inlaid, but the wet and dust have very much impaired the beauty of the casing; however, by what remains, one may judge what it has been. The stair-case within is narrow, and difficult of ascent, on account of the height of the steps: each story is formed of large beams, crossing each other horizontally, bearing the floor of a chamber, the ceiling of which is embellished with different kinds of painting; and the walls of the upper stories are filled with niches adorned with idols in basso-relievo. The masonry is all gilt, and has the appearance of marble or wrought stone, though I believe it to be nothing more than bricks cast in moulds, and neatly laid; for the Chinese are very ex-

pert at stamping all kinds of ornaments on their bricks, which being made of a fine earth, and well fitted, receive the impression of the mould much better than ours. The first floor is by much the highest; the rest are all of the same elevation. I counted the steps of the stair-case, and found them to be an hundred and ninety; and upon the most exact admeasurement I could take, the steps one with another appeared to be full ten inches high, which makes the height of the whole to amount to an hundred and fifty-eight feet. If we add to this the height of the raised foundation of brick-work, that of the ninth story, which has no steps, and the crown or summit of the building, the whole height of the tower from the ground will appear to be above two hundred feet: nor is the spire one of the least beauties of the tower; it is a kind of large mast, the lower end of which is locked into a socket in the floor of the eighth story: it rises more than sixty feet above the crown, and seems to stand in the middle of a volute or spiral twist of iron, at the distance of several feet from the mast, ending in a point; so that it resembles a hollow cone hanging in the air, pierced through in different places: and upon the apex of the cone is placed a gilded ball of a prodigious size. This is that famous structure which the Chinese call the Porcelain Tower; though at present it may more properly be called the Brick Tower, as there is no longer any appearance of porcelain on the tower, and as the incrustation on the outward wall below has much the resemblance of brick polished and varnished.

The grand piece of architecture, called the Great Wall, was begun about 2000 years ago. The Chinese erected it, by way of defending themselves against the Tartars: it is a master-piece of industry, genius, and perseverance, excelling every fortification attempted by the ancients.

It was in the time of the emperors of the fourth dynasty, according to historians, that the first and last stones of this famous wall were laid. In order to secure the foundation of it on the sea-coast, where it begins, they fenced and fortified it by sinking ships laden with stones and iron, and otherwise strengthened it by forts and bulwarks.

As China is separated from Tartary by a chain of mountains, this wall, which begins in the province of Chen-si, on the side of Tartary, is continued over mountains and vallies to the forty-second degree of north latitude, and then reaches southward as far back as to the thirty-ninth: it is principally built of brick, and bound with the strongest mortar, inasmuch that though it hath stood many centuries, it still continues firm. It is about five hundred leagues in length, including its many turnings and windings, and the intermediate spaces supplied by the mountains, which in several places are a natural fortification; and in many others there is a wide ditch only; so that of the real wall there are not more than one hundred leagues.

According to historians, this wall, during the reigns of the Chinese emperors, was guarded continually by a million of soldiers; however, since the conquest of the Chinese by the Tartars, they are satisfied with only guarding particular parts of it.

Travellers have greatly contradicted each other with regard to the height and thickness of this celebrated wall; we can, however, venture to affirm, from the best authority, that its greatest elevation exceeds not thirty feet, and its breadth is about sufficient for eight or ten men to stand a-breadth upon it.

The reason why some writers make this wall so much higher than others, arises from their taking the dimensions of such part or parts of it as are upon some high mountain; for it rises and sinks with the surface of the ground upon which it is built.

S E C T. VIII.

Of Chinese Architecture, Cities, Towns, Furniture, &c.

WITH respect to Chinese architecture, most of the cities and towns are built on a square model: two handsome streets, from east to west, and from north

to south, cross each other in the centre, and divide the town into quarters. Where these first intersect each other, there is a large opening; from whence are born the four great gates.

These cities and capital towns are enclosed by very high walls; and those towns to which the Chinese give the appellation of war-towns, have strong ramparts lined with thick walls, and flanked with towers; the whole encompassed with broad fosses. In some of the streets are the triumphal arches and pagods.

Their houses are erected upon stone pedestals, some sunk in the ground, and some on the surface; on these pedestals, at regular distances, are erected wooden pillars, whereon is laid the timber from which they spring the roof, which is almost flat, though nearly covered with tiles; as soon as the roof is laid, the walls are begun to be built, which are either of brick, wood, or tempered earth. The body of the building consists principally of a porch at the entrance, a hall facing the south, and three or four chambers, all on the ground-floor; the merchants indeed have frequently a story above, in which their goods are deposited, though for the most part they have only the same floor. The Chinese find great fault with our stories rising one above another; they express their surprise at our hazarding our necks in climbing up our stair-cases. When the emperor Kang-hi was shown some models of European houses, he said that Europe must certainly be a small and pitiful country, since, for want of room to build, the natives were forced to mount up into the air.

They never make any windows towards the street, because they do not chuse to be seen by passers-by; at a small distance from the door of the house within is built a little wall breast-high, on which a screen is placed, to prevent those who enter from perceiving what is transacted there: behind the wall are several little winding passages, terminating in different courts; and it is looked upon as very ungentle not to have two or three of these. They never receive visitors in the inner rooms, but in a sort of anti-chamber, opening on all sides, and have no other kind of decoration than a row of varnished pillars supporting the carpentry of the roof, which lies open to the view, without any ceiling intervening. They have in their houses neither tapestry, mirrors, or wrought chairs; nor is gilding in vogue any where except in the emperor's apartments, or in those of the princes of the blood. They have indeed some pictures, varnished cabinets, tables, &c. and pieces of white satin, upon which are inscribed sentences of morality. Porcelain vessels are the common embellishments as well as moveables of every house, for each apartment is full of them; their pictures have nothing curious in them, except the brightness of their colouring; for the natives have no idea of light and shade. They frequently hang up the pictures of their ancestors, and sometimes decorate their apartments with silken lanterns, painted in different colours, and suspended like our lustres. Their beds are their principal ornament, making use of the richest stuff, not shown to strangers, it being looked upon as impudent to the rules of good manners to lead people into a bed-chamber.

The Chinese know nothing of the art of glazing, but use the shells of oysters and other testaceous fish, ground thin even to a degree of transparency, or else square pieces of paper. It is necessary to remark, that the forms of their windows and doors are truly whimsical; some are round, some oval, and others square; some are in the form of a bird, a vase, a flower, a fan, or other figures.

The habitations of the mandarins and other persons of fashion, have a proportionable degree of simplicity with the other houses, and in substance the architecture is the same, the principal difference consisting only in their greater number of courts and gardens: and indeed, with regard to these habitations, 'tis entirely by custom and prejudice they are prevented from building them in a more elegant taste.

We are told by Le Comte, that while he was at Pe-king, a mandarin having built himself a house better than any other in the city, he was complained of to the emperor, upon which, dreading the

the consequence of the offence, he immediately ordered it to be levelled with the ground.

S E C T. IX.

Description of the City of Pe-king, the Royal Palace, Gardens, &c.

THE city of Pe-king, the capital of the Chinese empire, like London, is composed of two cities; one is filled the city of the Tartars, and the other the Chinese city; the circuit of both, without the suburbs, measures about six leagues. The imperial palace is situated in the city of the Tartars; for it was here the houses were abandoned and delivered up to the victorious Tartars when the present family came to the throne; and these refusing to suffer the Chinese to inhabit them any longer, the latter were under a necessity of living without the walls, where they soon built them another city, which is much more extensive in length than in breadth.

Pe-king is in the fortieth degree of north latitude, in the fine province of Pe-tche-li, twenty leagues from the great wall.

The walls of Pe-king are an hundred and fifty feet in height, and broad enough for several horsemen to ride a-breast upon the top of them: at proper distances are large square towers; the ditch is dry, though very deep and wide; the gates are of an extraordinary elevation, and the architecture of them in tolerable good taste: at each gate are two great towers, one without and the other within; they consist of nine stories, each with port-holes, and at the bottom is a spacious hall, where the officers and soldiers retire who come off guard: before each gate on the town side is an open space of about three hundred and sixty feet, which serves for a parade, unaccompanied by a semi-circular wall, equal in breadth and height to that which incloses the city; and here five hundred soldiers may be drawn up in rank and file.

The Tartar city has nine gates, two facing the east, two the west, two the north, and three the south. The Chinese city has only seven, to each of which answers a suburb. The latter city is much the most populous.

Most of the streets in Pe-king are laid in a line; the grand street is an hundred and twenty feet wide, and a league in length. The shops, on each side of the street, furnished with a beautiful variety of porcelain, varnished ware, and the richest silks, exhibit a most pleasing picture. Every tradesman places before the door of his shop a board handsomely painted, and gilt at the corners and edges, containing in large characters an account of the different articles of trade that he has to dispose of. These boards or tablets being placed upon pedestals, each seven or eight feet high, and nearly equidistant in one continued range, have a most striking and agreeable appearance; the houses, however, are low, most of them having only a ground floor. Nor are the courts of justice finished in any higher taste than the generality of the houses: their temples are the most magnificent structures, being embellished with statues, and their roofs, consisting of green or yellow tiles, elegantly varnished, and decorated with projecting dragons.

The streets of Pe-king, though so long and spacious, are crowded with people passing; but not a single woman is ever seen among the multitude. There are such throngs, that those persons who ride in chairs are often under the necessity of having a person on horseback to go before them to clear the way. Several causes combine to produce these crowds; as for example, besides the vast number of peasants who repair hither from the neighbouring country places, with their camels, horses, mules, and other beasts of burden, the greatest part of the mechanics, instead of keeping to their shops, go about the town in quest of business, carrying with them the several implements of their respective professions. Barbers, for instance, go about ringing little bells, to get customers; they carry with them a stool, basin, towel, pot and fire; and when any person calls to them, they run up to him, and placing their stool in a convenient place in the street, they shave the head, clean the ears, put the eyebrows in order, and brush the shoulders, all for a half-

penny. Then they ring their bell again, and are ready for another customer. The tailors, who ply in the streets, go home to the houses of their customers, and do their work there: they do not use thimbles as ours, but tie a rag upon their thumbs; nor do they sit down to their work, but few standing, except when they grow tired; the work is upon a table, and they stand close to it.

Amongst the crowd in the streets are ballad-singers, fortune-tellers, quack-doctors, &c. the latter distributing their nostrums, and extolling their wonderful efficacy.

With various haste here several ways they run,
Some to undo, and some to be undone;
While luxury and wealth, and war and peace,
Are each the others ruin and increase,
As rivers lost in seas, some secret vein
Thence re-conveys, there to be lost again;
While different avocations each pursue,
All have their secret aims, and private views.
Whether they spread forth pleasure's silken sails,
Watch folly's winds, and catch her fluctuating gales;
Or full of business fly from street to street,
With looks important, and unwearied feet;
Or to the more ingenious arts incline'd,
Make china-ware, or fans to catch the wind.
To self, of each pursuit the current flows;
There all their wishes, all their labours close;
Yet private ends assist the empire's aim,
For true self-love, and social are the same.

Whenever a person of distinction goes out, he is attended by a great number of his domestics: if he be a mandarin of the first rank, he is not only attended by these, but also by his subordinate mandarins, who also, to increase the pomp of his retinue, are all in particular dresses, attended by their valets; so that the train of one of these mandarins is of itself sufficient to embarrass a street.

The streets are always so incommoded either with mud in the winter, or dust in the summer, that they are in both seasons very disagreeable. There is so much dust occasioned by the cattle, that the city is in a manner covered with it, which gets into the shops of the tradesmen, and greatly damages their goods. Indeed they sprinkle the streets, but this has no great effect.

It has been already observed, that no women are ever seen in the streets: hence it may be easily judged how populous Pe-king must be, when its streets can hardly contain one half of the people, who, according to the assertions of some authors, amount to six or seven millions. Du Halde, however, says there are only three, and Le Comte reckons them at two only.

Pe-king is divided into a great number of wards, every one of which is again divided among several officers, who are so many overlords, having each the inspection of ten houses, and are obliged to give an account to the mandarin of every thing that transpires in their respective divisions. Masters of families are equally answerable for the behaviour of their children and servants; the families in each district are not only constrained to assist and protect each other as necessity may require, but if any robbery or outrage be committed, all are equally responsible for it.

Lewd women are not suffered to live within the walls; their houses are of a particular kind, and many of them lodge together, generally under the inspection of a man, who is responsible for any disturbance they occasion. In some provinces, prostitutes are not tolerated at all.

Pe-king is guarded by soldiers both day and night, who patrol the streets not only with thin swords, but with whips in their hands, with which they lash indifferently all persons concerned in any riot or breach of the public peace. Indeed, there is always in this city a garrison of forty thousand men to preserve good order and peace. There are no clubs, balls, or other nocturnal meetings here; and the soldiers take into custody all persons whom they see in the streets in the night-time, if they do not give a good account of themselves. In the principal streets they found the watches of the night on a large bell, or else on a drum of extraordinary

nary size: a watch consists of two hours; the first commences at the approach of evening, when they give one stroke on the bell or drum, and at intervals repeat it during the night. When the second watch begins, they give a couple of strokes, and repeat the same as before, till the third begins, and so on. These bells, which are of the same metal as ours, are struck by large wooden hammers, which consequently in point of sound render them far inferior to the European. What they call the great bell of Pe-king, is, beyond all doubt, the largest in the universe, one excepted; it was cast near four hundred years ago, and weighs an hundred and twenty thousand pounds. That which we except, is the great bell of Mokow, weighing three hundred and twenty thousand pounds.

We shall now speak of that magnificent edifice, the Emperor's palace.

This noble structure is in an oblong square, about two English miles in length, and a mile broad. Within its walls are contained not only the house and gardens of the emperor, but likewise a great number of offices and lodges for his ministers and servants; in fine, there are dwelling-places for all the artificers employed in his service; thick, however, are low ill-contrived buildings.

The palace is above three miles in circumference; the front of it shines with gilding and varnish: it has nine superb courts, communicating with each other through grand arched gates, each with lofty gilded turrets; the wings of the courts are lined with ranges of galleries.

The apartments of the emperor are at the head of the east court, with porticoes on each side of the entrance, supported by grand columns. Round the royal apartments is a white marble terrace, with a balustrade that has three openings answering to so many alcoves, one on each side, consisting of a flight of steps, and a gentle slope in the center of the front.

Among the apartments of the palace is the hall of audience, where the emperor receives foreign ambassadors: he is seated in a sort of alcove, with his legs across in the manner of the Tartars, surrounded by his ministers; and his throne is covered with the richest tapestry: he wears round his neck a chain of coral, and on his head a cap bordered with fable, from which hang peacocks' feathers and filken tassels.

The ceiling of the above-mentioned hall is of carved work, painted green, and embellished with gilded dragons: the columns that support the buildings within are six or seven feet in diameter at the base, ornamented with a fine red varnish on a ground of exquisite plaster; the walls are of a shining white, though without any tapestry, pictures, or mirrors.

The other apartments are far grander, in point of ornament, than this hall of audience; as, exclusive of the carved and gilded ceilings, they are furnished with paintings, tapestry, rich cabinets, and elegant carpets.

In China, gardeners are held in the highest estimation, and the art of gardening is ranked among the liberal arts.

The culture of the earth is deemed worthy of the utmost legislative attention, and consequently gardening hath been carried to a much higher degree of perfection in that country, than in any other part of the universe.

The royal gardens of Pe-king, have justly challenged the admiration of the curious, and may be numbered among the wonders of the world. They are a kind of stupendous drama, in which the beauties and defects of nature and the works of art are admirably represented, in such a manner as to affect all the passions of the human soul.

To such a monarch as the emperor of China, such a garden seems absolutely necessary, for he is too much the slave of greatness to emerge from his palace but upon some extraordinary occasion, or to be seen in public but when state necessity requires it. His life therefore would be disagreeably insipid without the amusements which his gardens afford him, and his dignity would render him the most confined, and least amused person in his extensive dominions.

These gardens contain innumerable buildings, some regularly elegant, others rudely simple; some of a

grotesque nature, and others in imitation of ruins. Thus all the varieties of architecture are blended with the productions of nature. And the animal, vegetable, and mineral creation, are happily united to complete a most astonishing scene.

Every advantage hath been taken of every foot of ground; here nature hath been courted to display her beauties, there the scene is varied by exhibiting her defects; in other places she hath been compelled by art to perform that which of herself she could not have executed.

Plots laid out with the utmost regularity surround the regular buildings, and nothing is admitted either in the fabrics themselves, or the circumjacent plantations to affect the propriety or symmetry of the whole. But where the buildings are rustic, the scene about them is wild, and the rural taste is conspicuous in a kind of natural simplicity; other parts, to excite gloomy ideas, are laid out in a rude sublimity, and the most tremendous objects are called in to render the whole more awful; when the astonished spectator quits the melancholy prospect, and proceeding farther, is soon agreeably surprised by the gayest scenes of luxuriant nature. In these various parts a great number of bulls, statues, &c. are disposed, and always suited to their situation with the most scrupulous propriety. These are designed to commemorate past transactions of a remarkable nature, to perpetuate the name of some singular character, to excite the various passions, divert the attention, or else they allude to some popular story. On these statues, as well as on fountains, ruins, &c. there are a variety of inscriptions, and verses, tending not only to amuse the mind, but to promote the cause of virtue and morality. Thus a Chinese gardener is a poet by nature, and his works are dramatic compositions, in which the most material objects of creation are selected and improved by art to embellish his labours.

In these gardens, the different scenes are adapted to the different times of the day, and likewise to the various seasons of the year; and as China produces all the vegetables and plants of Europe, as well as many others peculiar to that country only, there is a perpetual verdure in some part or other of the garden: so that the different seasons amuse the imagination in one hour; and varied nature appears to be here compacted for the entertainment of the emperor and his court.

Here is likewise a metropolis in miniature, in which, at certain times of the year, all that is transacted in Pe-king is repeated by the eunuchs of the seraglio, who personate various characters. Shops are opened in all businesses, and persons of all occupations are represented in a lively and natural manner, busy at their various employments.

Sham robberies are committed, all kinds of mimic frauds perpetrated, and pretended courts of justice held on the several delinquents who are seemingly apprehended.

A fine canal or river flows through this town, ships and barks arrive at the quays, goods are landed, brokers are employed, merchants purchase the commodities, which are placed in warehouses and shops, are retailed to others. In fine, all the amusements of a police, and the hurry of a commercial city, are here executed in such a manner as to excite the curiosity, and lead up to the imagination as realities. On the plain are flam fights, and all manner of military exercises; on the river mock engagements of a naval nature, and rowing matches. There are menageries resembling woods of ferocious animals, and tame ones run about several parts of the garden at their pleasure.

In those parts which are intended to excite gloomy ideas, are tombs, hermitages, and ruins, amidst dreary deserts and dismal woods. Here are seen dreadful precipices, barren rocks, dark caverns, impetuous cataracts, gibbets with criminals hanging on them, terrible volcanoes made by the means of concealed lime-kilns. In dark passages the forms of dragons, furies, and other horrid objects, are placed in the most terrible attitudes. The passenger is likewise shook by earthquakes, which are caused by electrical means, assaulted by artificial thunder, lightning and rain, and surprised by the report of ordnance, and the sound of various warlike instruments. Many of the places are guarded by monstrous

giants, terrible dogs, and frightful dwarfs. Upon the whole, this wonderful garden contains an assemblage of the most pleasing, luxuriant, melancholy, romantic, and surprising scenes, and is calculated to excite all the human passions in their greatest varieties.

Description of the City of Nan-king, Sou-tcheou, and Canton; Account of the Chinese Marine and their Barks.

WE shall now present our readers with a description of the cities of Nan-king, Sou-tcheou, and Canton, after which we shall proceed to an account of the Chinese marine and barks.

The extensive and once splendid city of Nan-king, (a name signifying the court of the south, as Pe-king does the court of the north) is the capital of the province of Kiang-nan, and was for many ages the capital of the Chinese empire, as well as the residence of the emperors; whence it took its name. It is the largest city in China, and was originally surrounded with a triple wall, measuring about sixteen leagues in circumference: but the palace, once famous for its splendor and magnificence, hath been destroyed, as well as many grand monuments. The streets of this city are narrow, but well paved; the houses low, but handsome; the shops spacious, and most richly furnished with goods. Nan-king is celebrated for its great number of libraries; it excels likewise in printing, and in artificers of most kinds: here too reside the most eminent doctors of the empire, as well as the greater part of such mandarins as have been discharged from their governments.

The number of people resident in this ancient city is estimated at about four millions, including those who live in barks upon the water; and indeed, whenever a city is situated on the banks of a canal or river, there is seen another large floating city of barks; so that the rivers and canals of China, are in proportion as populous as the land.

The present public buildings of Nan-king have rather a mean appearance, except a few temples, the city gates, and a tower about two hundred feet in height.

The commercial and beautiful city of Sou-tcheou, the second city of the province of Kiang-nan, may, in point of situation, be compared to Venice, though it far exceeds it in extent and populousness. It is four leagues in circumference, exclusive of the suburbs, which are very extensive: it abounds with canals of pure water, capable of bearing ships of heavy burthen; and here people are conveyed to almost any part of the city in gondolas elegantly painted. The commerce and riches of this city, the beauty of its situation, the fruitfulness of the country around, the continued appearance of the gondolas, the concourse of visitants, and the natural politeness of the inhabitants, render it, in the fullest sense of the term, the Paradise of China.

The large, wealthy, and populous city of Canton, called by the natives Quang-tcheou, and which is the capital of the province of Quang-tong, is about as large as Paris; the houses stand very thick; the streets are long, and rather narrow, almost all laid out by the line, and well paved, with triumphal arches in several of them; here are also some temples of tolerable good workmanship, in which the bonzes live.

As Canton is situated upon the banks of one of the finest rivers in China, deep enough for the largest ships, all the curiosities of the empire are brought hither. In going up the river, the eye is delighted with one of the most charming prospects in nature, being nearly encompassed with verdant fields, lawns, groves, and hills gently rising one above another. Both sides of the river are covered with barks, ranged on parallel lines, forming, as it were, streets and alleys; and in each of these barks reside a whole family: the poorer sort quit their bark in the morning, and repair to the fields or streets, to earn their livelihood, and return to their families in the evening.

A principal share of the opulence of Canton flows

from its commerce with the Europeans, who are not permitted to enter any other port in China.

According to a very exact computation, the whole fifteen provinces of the Chinese empire contain fourteen hundred and sixty-nine large towns, and two thousand large citadels or castles.

As to the Chinese marine, the natives boast that they were acquainted with the art of navigation, and the Indian seas, long before the birth of Christ. They are acquainted with the compass, and pretend to be the inventors of it; however, they have but small advantage of the invention: instead of suspending it on a pivot in a box, so as to keep its equivoque, they place it upon a bed of fine sand, which does not prevent its being affected with the shocks of the vessel; and in rough weather the needle often loses its direction. The Chinese sailors are superstitious enough to worship their compass, and offer perfumes to it in sacrifice.

Their barks have generally two masts, and sometimes three: most of them, especially those used for merchandise, have flat bottoms, and are from head to stern of one and the same breadth. The Chinese usually build several chambers or cabins, though all in the vessel's centre; these are of a moderate height, particularly the middlemost, which is in general the highest; and sometimes they have only one large room erected on pillars, open at the sides, and covered with a roof sloping, on which is a dome decorated with filken streamers. The masts and sails have a very rude aspect, the former being of rough trees just as produced by nature, except that the twigs and branches are lopped off: the sails are of mat, strengthened with pieces of bamboo: the vessel is caulked with a sort of gum, mingled with lime and bamboo threads, and the anchor is of a hard wood pointed with iron. They have another sort of bark not unlike our galleys, and which they not only use in their rivers, but on the sea-coasts, as likewise to sail between the islands; they are painted at head and stern, have three masts, and in calms go with oars. The barks, which carry the mandarins to their respective provinces, are not only large, but elegant, being highly varnished, and decorated with dragons. They generally consist of two decks, several chambers, little cabins, a dining-room, apartments for servants, and other conveniences. When a large bark faces a high wind, or fierce current, it is drawn along by ropes; at other times large poles are used, and sometimes oars.

The dealers in salt and wood convey those articles in booths built on rafts. They bring the trunks of large trees to the river side, where they saw them into beams and planks; then boring a hole at each end of every piece, they fasten them together with other bands, and so form their floats five feet high, and about ten broad: they have no fixed measure for their length; some extend half a league. At convenient distances they erect huts or booths; and as every length of timber is only fastened to the next by bands, the whole united raft moves easily any way, like the link of a chain, and is very conveniently managed in the windings of any river. In the huts, or booths, the people eat, drink, and sleep, and often sell them with their salt and wood. These rafts are sometimes thus conveyed five or six hundred leagues, and seen at a distance like so many little floating towns.

Though the Chinese know not how to navigate the seas like the mariners of Europe, yet upon rivers and canals they are peculiarly skilful. In the canals there are sluices for the retention of water, and these they ascend and descend with a matchless judgment. In rapid and rocky rivers, flowing with the utmost violence for perhaps 60 or 70 leagues, the sailors are for several days together in continual peril; and no European whatever could navigate a vessel here.

S E C T. XI.

Compendious, accurate, and interesting History of China.

IN the year 1729, Mr. Fouquet, titular bishop of Eleutheropolis, published a chronological table of the empire of China: this table, which was revised and corrected by a Tartar nobleman, named Nyen, fixes the commencement.

commencement of the real Chinese chronology in the reign of Iye-vang, the date of which answers to the year 433 before Christ. Farther than this the writers of the Kang-mu, or grand chronicle of China, go not, but very ingeniously acknowledge, that their chronologies before that period is not to be depended upon.

None of the literati seem to dispute the antiquity of the Chinese; but it is difficult to ascertain the first period of their true chronology.

Mr. Fouquet allows the Chinese nation to be near as old as the deluge; nor does Maigret, in his remarks on the obscurity of the reign of Fo-hi, deny the reality of it; Mr. Fourmont, and others of the learned, give it as their opinion, that the Chinese have been a nation near four thousand years. Even such as have treated with ridicule the pretensions of these people to antiquity, allow their monarchy to be at least as ancient as that of the Egyptians, Assyrians, or any other country recorded in history. Upon the whole, the antiquity of the Chinese is great beyond all dispute; but as to the exact period of their origin, that is a point the most sagacious cannot determine.

According to P. Du Halde, the first inhabitants of China settled in the province of Chen-si, from whence they spread themselves over the adjacent countries, Honan, Pe-tche-li, and Chang-tong, which four provinces together formed a considerable kingdom, containing that large tract of country lying north of the river Yang-tse-kiang.

The fame of the first princes of this infant monarchy brought together great numbers of foreigners; wherefore, to extend the bounds of their kingdom, they drained a large tract of low country that lay under water, fencing the land against the incroachments of the sea with high banks, and by the same means confining the course of the rivers within deep and narrow channels: thus two fine provinces, Tche-kiang, and Kiang-nan, were added to the kingdom.

"Under the reign of the emperor Yu," says P. Du Halde, "which they place above two thousand years before Christ, they discovered a large tract of territory to the south, partly destitute of inhabitants: this large extent of country, Yu and his successors peopled with colonies at different periods, under the controul of princes of the blood, to whom they portioned out this new country, reserving to themselves only some acknowledgment. Thus were formed several little tributary kingdoms, which being afterwards united to the empire, rendered it very considerable. During the reign of Yu, the monarchy was divided into nine provinces, a particular delineation of which this emperor caused to be engraved on nine brazen vessels. In the year 2337, before Christ, several nations sent ambassadors to China, and submitted voluntarily to a yearly tribute. Towards the end of the second dynasty, about twelve hundred years before Christ, certain Chinese colonies extended themselves to the eastern coast, and also took possession of several islands. Under the fifth dynasty, which commenced about the year 200 before Christ, the Chinese not only enlarged their borders to the north, after many signal victories obtained over the Tartars, but pushed their conquests even to the confines of India, viz. to Pegu, Siam, Cambaya, and Bengal. About six hundred years after Christ, Kao-tsou-venti, founder of the twelfth dynasty, added to the empire several of the northern provinces, situated beyond the river Yang-tse-kiang, and which at that time composed a particular kingdom subject to the Tartars: this went by the name of the Northern Empire for several ages. Lastly, the revolution, which happened in 1644, when China was conquered by the Tartars, only served to increase the power and extent of this great empire, by joining to its former possessions a considerable part of Great Tartary. Thus this vast monarchy attained to the summit of its greatness, by a gradual progress, not so much in the way of conquest like other empires, as by the wisdom of its laws, the reputation of its government, and at last by its duration."

The Chinese empire has been successively governed by twenty-two Imperial families: the order of the dynasties commenced with the family of Hia, the first of whom was distinguished by the title of Yu.

The three first families on the Imperial throne fill up the space of near two thousand years in the Chinese annals, whilst the reigns of the succeeding nineteen monarchs scarce measure an equal space of time.

The dynasty, or family of Yu, ended with the reign of Kie, a wretch of infamous memory, who is said to have drowned, in the space of one day, three thousand of his subjects, in a pit which he caused to be filled with wine. This and other enormities occasioned a revolt of his subjects, who placed upon the throne Tchou-tang, a tributary prince of China.

Tcheou, the last prince of the second dynasty, rendered himself abhorred by his subjects on account of his wicked and debauched life: his people therefore applied to Vou-vang, a prince of a small neighbouring state, and placed him on the throne. Vou-vang, however, in the beginning of his reign, committed a very capital fault, which in time was productive of great revolutions. In order to gratify certain families, and the princes of the blood royal in particular, he erected for them several petty kingdoms, which were at first feudatory to the empire, but soon after declared for independence. Under the thirteenth emperor of this dynasty, all these petty princes were engaged in intestine wars, and distracted the whole empire. China became a scene of rapine for many ages; its authority was held in contempt, and the tributary princes controuled the emperors, entreprising and deposing them as their inclination or caprice dictated. Tcheou-kiun, the thirty-fifth and last emperor of this race, found a very powerful rival in Tcheou-fiang, his vassal, the king of Lin, to whom he was forced to give up his crown; this rebel, however, happened to die suddenly, and his son, who succeeded him, also died soon after; so that his grandson was the first who enjoyed the advantages of this usurpation. This grandson was named Tcheou-fiang-vang, and was the founder of the fourth dynasty, which gave four emperors to China, and lasted forty-three years only.

The fifth dynasty began with the reign of Lieou-pan, who was first a common soldier, and at the head of a gang of robbers; he obtained the Imperial throne by dint of violence, and yet proved himself capable of governing with a becoming dignity, judgment, penetration, and justice. This dynasty lasted four hundred and twenty-six years, and produced a great many very respectable characters; but the last monarchs of this race suffering themselves to be ruled by the court eunuchs, fell into disgrace, and became as odious as the eunuchs themselves. The people took up arms, and wars ensued, which terminated in a division of the empire into four parts, under four distinct sovereigns; these, however, were re-united by Tcheou-lic-vang, founder of the sixth dynasty. This monarch, after the short reign of three years, died, and left Heou-ti, his son, who filled the throne forty-one years, and then most shamefully abdicated it in favour of the usurper Chi-tsou-vouti, founder of the seventh dynasty.

The seventh race or dynasty subsisted one hundred and fifty-five years, giving sixteen emperors to China, most of whom, through their want of capacity to govern, discredited the elevated station of life in which they had placed them. The last of these monarchs was put to death in the second year of his reign by one Lieou-son, who quitting the trade of a shoe-maker, commenced soldier, rose to the rank of general, and afterwards ascended the throne of the empire.

This eighth dynasty, with the ninth, tenth, and two following, only comprehend one hundred and ninety-eight years; in which space of time there were no less than twenty-four reigns. The Chinese annals of this period present us with scarce any thing but revolution, rapine, and destruction; weak, timid, and capricious princes, controuled by their ministers, and some of them betrayed and even murdered by the very men in whom they had confided.

Under the first emperor of the thirteenth dynasty, the people enjoyed the blessings of peace, the happy chance of the prudent and constitutional administration of those emperors. The tranquillity, which was in a more particular manner enjoyed during the reign of Tai-tou, the second emperor of this family, is recorded to the immortal honour of that sovereign. Under Hiven, the

sixth emperor, the tranquil state of the nation was disturbed with new commotions and seditions, which lasted in continual succession from his reign down to that of Tchao-fuen, the twentieth and last emperor of this race.

These disturbances were occasioned by the arbitrary and oppressive conduct of the eunuchs, to whom the monarchs of this dynasty committed an unlimited exercise of regal jurisdiction. Tchou-ven, the captain of a gang of banditti, taking advantage of their unhappy broils, deposed Tchao-fuen, murdered him, and founded, himself, the fourteenth dynasty.

This dynasty, with the four following, subsisted about fifty years; in which short interval no less than thirteen monarchs waded the Imperial sceptre, most of whom suffered a violent death.

During these last dynasties it was, that the Tartars, who inhabited Leao-tong, one of the most northern provinces of China, began to render themelves powerful. This province was ceded to them by the last emperors of the thirteenth race; and Kao-tou, head of the sixteenth, who was indebted to them for his advancement to the throne, gave up to them sixteen more towns in the province of Pe-tche-li, exclusive of a tribute of three hundred thousand pieces of silk. These shameful compliances increased their power and pride, and were productive of wars for four hundred years, which nearly desolated the empire.

Under the nineteenth dynasty, the Chinese called to their assistance the Niu-tche, or eastern Tartars, in conjunction with whom they drove the northern Tartars from a country which they had possessed upwards of two centuries: the Chinese, however, were obliged to pay dearly for the aid of their allies, who not only constrained them to cede Leao-tong by way of compensation, but also took possession of Pe-tche-li, Chen-fi, and Honan; and they some years afterwards invaded the very heart of the empire, took Nan-king the capital, burnt the royal palace to the ground, and forced the Chinese to accept of the most dishonourable terms of pacification.

Under this dynasty, another race of Tartars, called the Tan-yu Tartars, settled westward of China, entered into an alliance with the Chinese against their conquerors the Niu-tche Tartars, and after several engagements the Niu-tche victors were themselves conquered and driven from their possessions in Leao-tong and the other provinces, after an usurpation of an hundred and seventeen years. The Tan-yu heroes, however, in requital of their services, demanded a kitement in those provinces from whence they had exterminated the Niu-tche Barbarians; these were accordingly ceded to them; but not contented with such cession, they took possession of Yun-nan, Se-tchuen, and Hou-guang; and in less than half a century were masters of the whole empire.

This dynasty, the twentieth, took the name of Yuen, and had for its founder Chi-tou, fourth son of Taitou, in whom commenced the third Tartarian usurpation. The Yuen family gave to China nine emperors, the former of whom, by their prudent administration, won the hearts of their subjects; but the succeeding monarchs, indulging in a life of indolence, luxury, and dissipation, perceived themselves excelled in the use of arms and natural courage by the very people whom they had conquered, who possessing the liveliest sentiments of freedom, and despising their dissipated victors, wrested conquest from their hands, and drove them back to their native country. This dynasty, which lasted only eighty-nine years, became extinct in the person of Chun-ti, a very worthless monarch, who was addicted to a variety of vices.

The twenty-first race or dynasty, of which Tai-tou was founder, subsisted two hundred and seventy-six years. The commotions that happened under this family produced gradually that grand revolution which a second time placed a Tartarian family on the throne of China. The progress of which was as follows:

When the Niu-tche or eastern Tartars were expelled from Leao-tong and the empire, they retreated into the ancient country bordering upon Leao-tong, & separating themselves into seven distinct cantons, and fighting against each other, till at length they were united in

subjection to one sovereign. It happened that their merchants, trading in Leao-tong, having received some indignity from the merchants of China, exhibited a complaint to the mandarins, who, instead of attending to their complaint, augmented considerably the grievance, by craftily drawing their prince into an ambuscade, and severing his head from his shoulders.

The Tartars, enraged at this cruelty and iniquitous act, marched a numerous army into the very heart of Leao-tong, commanded by Tien-ming, son of their murdered prince, who subdued Leao-tong and Pe-tche-li, but was soon obliged to abandon those provinces, which were, however, with the rest of the Chinese empire, reserved for his grandson T'iong-te, but who was cut off by sudden death in the moment of his great view of sovereignty. He had been brought up and educated in China, was master of the Chinese tongue, and perfectly acquainted with the disposition and genius of the people.

The empire was at this period very critically situated: the war with the Niu-tche Tartars continued, and as an addition to this national calamity, there was a great famine in the land. The then reigning monarch, too, Hoai-tong, was a man of mean abilities, suffering himself to be directed in every thing by his ministers and eunuchs, who greatly oppressed the people. A revolt was the consequence, and in a short space of time there were eight different factions under the same number of chiefs; these were, however, reduced afterwards to two, and at length to one, headed by a commander named Li, who invading and possessing himself of the provinces of Ho-nan and Chen-li, styled himself emperor of China.

In Ho-nan he committed the most dreadful ravages; in his attack of Cui-tong, its capital, that town was laid under water by a sudden breaking down of the dykes of the Yellow-River, and three hundred thousand persons perished in the inundation. He afterwards marched to Pe-king at the head of three hundred thousand troops, and entered the city without the least opposition; for he had privately conveyed into the city a number of his people in disguise, who throw open the gates to him: and such was the supineness of Hoai-tong, the emperor, that he knew nothing of this circumstance till the usurper had laid the whole city under his subjection.

The emperor, however, as soon as he heard the news, marched from his palace at the head of six hundred of his guards, who treacherously abandoned him. Thus situated, he flew into the gardens of his palace with his daughter, whose head he cut off, and then hung himself upon a tree: his wives, his prime minister, and some of his eunuchs, also destroyed themselves.

The news of this melancholy event soon reached the army, then making war in Tartary, under the command of a general named Ou-fang-guey, who refused to acknowledge Li as his sovereign; whereupon the latter put himself at the head of his numerous army, for the purpose of giving him battle. Ou-fang-guey shut himself up in a strong fortified town; thither Li marched his troops, and having taken captive the father of Ou-fang-guey, ordered him to be loaded with irons, and placed at the foot of the town wall, sending word to his son at the same time, that if he did not immediately surrender, his father's throat should be cut from ear to ear. The father found means to send a message to his son, begging him to surrender; the son sacrificed his filial esteem to the interests of his country, and the old man was most cruelly put to death.

The patriotic soul of Ou-fang-guey, now inflamed with rage, concluded a peace with the Niu-tche Tartars, and engaged them to enter into an alliance with him against Li, whose superior force it was impossible for him to resist.

T'iong-te, their king, came to his assistance at the head of eighty thousand warriors, forced the tyrant to raise the siege, pursued him even to Pe-king, and so totally routed his army, that he was forced to fly into the province of Chen-fi, where he spent the remainder of his days in obscurity. T'iong-te being thus successful, the people idolized him as their deliverer, and he bestowed several distinguished honours upon the

faithful Ou-fang-guey: the latter, however, soon had cause to repent his having leagued himself with so great and powerful a prince; for T'ing-te was no sooner arrived at Peking, than he began to think of improving the success of his arms, and the favourable disposition of the people, (with whom, as hath been observed, he had been brought up and educated) into the means of his advancement to the throne of China; but being seized with an illness that speedily brought on his dissolution, all that he could do was to declare his son emperor, who was only about six years of age. This election was confirmed by the grandees and people, who in consideration of the signal services done by the father, connived at the tender age of the child, who took the name of Chun-ci, and is considered as the founder of the twenty-second dynasty, which now fills the imperial throne of China.

This revolution happened in the year 1644, uniting a considerable part of Great Tartary to the Chinese empire; and since the union, the Tartars seem rather to have submitted to the laws of the Chinese, than to have imposed any upon them; in fact, the latter may be said to be as great gainers by it as the Tartars themselves. China still holds the seat of empire, and has the supreme courts of justice; thither flows all the opulence of the united kingdoms, and all honours are conferred there. Both nations, so opposite in genius and character, have each been considerably advantaged by the incorporation: the fierce spirit of the Tartar has given a spark of martial fire to the peaceful temper of the Chinese, while the arts and commerce of the latter have humanized and softened the savage roughness of the former. China having acquired great additional strength by her union with Tartary, has now no enemy to dread; nor were ever the opulence, power, grandeur, and glory of the Chinese empire greater than at present: at home it hath all the blessings of peace, and abroad it is respected: it hath enjoyed a perfect tranquillity for upwards of seventy years, and is unrivalled by all other nations for its public works of art, having thirty-two royal palaces, two hundred and seventy-two grand libraries, seven hundred and nine halls, eleven hundred and fifty-nine triumphal arches, three hundred and thirty-one beautiful bridges, and six hundred and eighty curious tombs.

A chronological Table of the Twenty-two Dynasties of China.

Dynasties.	Years before and after Christ.	Duration of each Dynasty.	Emperors.
I Hia	2207	458	17
II Chang	1766	644	28
III Tcheou	1122	874	35
IV Tsin	248	42	4
V Han	206	426	25
After Christ.			
VI Heou-han	220	45	9
VII Tsin	265	155	15
VIII Song	440	59	8
IX Li	479	23	5
X Leang	502	54	4
IX Tchin	557	34	5
XII Souy	590	29	3
XIII Tang	618	289	20
XIV Heou-leang	617	16	2
XV Heou-tang	907	13	4
XVI Heou-tsin	930	11	2
XVII Heou-han	947	4	2
XVIII Heou-tcheou	951	9	3
XIX Song	960	320	18
XX Yen	1280	89	9
XXI Ming	1368	277	16

Thus it appears, by the above table, that the Chinese empire hath been established near four thousand years; during which space of time, there have reigned two hundred and thirty emperors.—The third column shews the duration of each dynasty, or race of emperors.

SECT. XII.

Of the Emperor; his Procession to the Temple of Tien; the Obligation he is under of receiving the Petitions of his Subjects; his Revenue and military Force; his general unlimited Power.

THE emperor of China is styled by his subjects the son of heaven, the holy emperor, the sole and grand governor of the world: they actually adore him; not even his first minister, or his near relations, must presume to approach him without falling on their knees. His other subjects always prostrate themselves when before his throne, even if he be not sitting there; and if they see either his girdle or his robes, they must also fall prostrate on the ground. No person, even of the first rank in life, passes by his palace on horseback, or in a chair, but quits his seat before he arrives at it, and walks till he has got beyond it.

The Chinese emperors, however, take no unconstitutional advantage of this excessive homage paid them by their subjects, but in general govern with lenity.

When they go to the temple of Tien with their offerings or sacrifices of gratitude, they appear in all the magnificence of eastern pomp: the procession commences with drums and trumpets; a number of persons then follow with staves painted red; these are followed by soldiers with red maces adorned with flowers; four hundred magnificent lanterns, and as many flambeaux then appear, diffusing a most grand illumination: then come a great number of persons with spears, and twenty-four banners, with the signs of the Zodiac painted on them, which the Chinese divide into twelve parts; the fifty-six other banners follow these, representing the fifty-six constellations, to which the Chinese reduce all the stars; about two hundred fans, and several umbrellas, are the next objects; on the fans are painted birds, dragons, &c. the fans are held high in the air by means of the poles, and the umbrellas are magnificently ornamented: a grand bouquet, furnished with golden cups and other valuable articles, is next seen; and then comes the emperor himself, who is on horseback, in rich apparel; he is attended by his pages, and an hundred men with spears; and near him are six milk-white steeds, whose trappings are adorned with jewels. The princes of the blood, mandarins, &c. then follow, in their proper habits, with five hundred youths belonging to the palace, followed by a thousand footmen. Two grand chairs are next seen; one is borne by about forty men; and the other, which is considerably larger, by upwards of an hundred; then come chariots drawn by elephants, and some by horses, each attended by fifty men. The procession closes with two thousand mandarins of letters, and the same number of mandarins of arms, all in their proper dresses.

Notwithstanding the pomp and ceremony, however, of the above procession, the emperors do not in general live in that splendor and luxury to which other eastern monarchs are so much accustomed, but content themselves, except on public occasions, with a moderate attendance, a decent frugality at their table, and a well-regulated economy in all their other expenses. They divide with their ministers the cares of government, not laying the whole burden on their own shoulders; indeed, they are obliged, by the laws of their country, to take a considerable share of the trouble upon themselves. A minister has the privilege of telling the emperor of his faults, provided he does it with great humility and deference; if he discovers any thing in the conduct of his sovereign incompatible with the welfare of the empire, he draws up a writing, in which, after using every necessary expression of respect for his majesty, he complies him to adhere steadfastly to the ancient laws, customs, and examples of his predecessors, and then points out to him in what instances he has erred. This writing lies upon a table with petitions daily presented, for the emperor is obliged to receive petitions, or remonstrances; the people have a right, founded on custom as well as on the constitution, to be allowed access to him in person with any petition or remonstrance, when they have information to lodge against his officers for any corrupt practice. The emperor is obliged to read and answer

answer these petitions or remonstrances: should he be weak or obstinate enough to refuse to read them, or cause to be ill-treated the persons who present them, he would become odious and detested throughout the whole empire. The necessity of justice in him tends to make him wise and intelligent; he is, what one would wish all princes to be, the idol of his people: he does not possess his authority as a conqueror, or a legislator, but as a father; as a parent he reigns, as a parent he governs, rewards, and punishes. He has two sovereign councils; one, which is styled the extra council, is composed only of princes of the blood royal; the other, which is styled the council in ordinary, has, exclusive of these princes, several ministers called Colao, who investigate state matters, and make their report to the emperor.

A certain custom of some of the literati and men of genius of the empire, hath no small tendency towards rendering an emperor studious to oblige his subjects: these literati, distinguished as much for their justice as their learning, are fixed upon to observe, with the most scrupulous nicety, the general public conduct of the emperor: each makes his own remarks, and, without communicating them to either of the others, commits them to paper, which paper he puts into an office appropriated solely for the receipt of it: but that neither a view of interest on one hand, nor a dread of displeasure on the other, may bias them in their observations, what they write is never made public during the prince's reign, nor indeed while any of the family sit on the throne. But when the crown passes into another dynasty, these manuscripts are made public, and form the history of the last dynasty.

The emperor, from motives of policy, if not from principle, appears always to have a paternal and tender regard for his people; and whenever any of his provinces are visited with a particular calamity, he for some time abstains from all public amusements, keeps himself close in his palace, and perhaps retrenches some of the ordinary taxes. His revenue is immense, amounting to more than twenty-one millions a year; and his army is seven hundred and seventy thousand strong. He has an unlimited power to declare war, proclaim peace, or conclude treaties. He takes cognizance of all important matters transacted in the six sovereign courts of Peking; but the management of the finances is under the direction of the officers of the second (twelve) court: all the revenues of the state pass through their hands, they being the appointed guardians of the imperial treasure. The public revenues are not farmed, nor do they pass through the hands of several under-receivers, but the chief magistrates of each city regulate and collect the levies, and remit them to the treasurer-general of the province, who transmits them to the tribunal of finances at Peking.

SECT. XIII.

Of the Nobility, and the Mandarins.

AS to the nobility of China, people are promoted and ennobled here in proportion to their merit; though, strictly, none but the imperial family have any real title of distinction, in whose favour five honorary degrees of nobility are established. The title of prince is not only given to the sons of the emperor, but also to his sons-in-law; and to these latter are granted annual stipends adequate to their dignity, but no authority in consequence of marriage; a prince of the lowest rank, however, is superior to the first mandarin in the empire, and distinguishes himself by a yellow garb.

The son of a mandarin ranks no higher on account of his birth than the son of a peasant: the emperors indeed confer certain titles answering to those of duke, earl, and viscount with us: but these do not descend.

They have a singular method in China of dignifying, by ennobling the ancestors of any person back to the ninth and tenth generation; but this confers no honour on his issue; so that, properly speaking, there are only two noble families in China, that is, wherein nobility is derivative, viz. that of the reigning emperor, and that of Confucius, of whom we shall give some account in a proper place. The descendants of Confucius have been honoured with distinguished privileges for two

thousand years; and it is from his illustrious family that the emperor always chooses a person of learning for governor of Ki-feou in Chan-tong, the place of nativity of that great philosopher.

The princes of the blood reside at court, and have palaces there, though no authority over the people. Besides the ladies to whom these princes marry, they have generally three nominal wives, on whom the emperor bestows titles, and whose children take place next to those of the lawful wife, and are much more respected than the children of their concubines.

The mandarins are the governors of provinces and cities; they are chosen by the emperor. Those are called mandarins of letters who have applied themselves to literature, and passed through the degrees prior to that of the doctorate. These men have the direction of the political government of the empire; their number is from thirteen to fourteen thousand, and are divided into nine classes, out of the three first of which the emperor makes choice of his ministers and officers of the first rank, as the colao, or ministers of state; the judges of the supreme courts; the governors of the capital cities; the treasurers general of the provinces, the viceroys, &c. But the children of those who enjoy even the very highest offices, are sometimes obliged to follow mechanical professions: indeed the son of a mandarin may succeed to his father's wealth, but not to his dignity; he must rise, as his father did, merely by dint of merit, to enjoy honourable reputation. The inferior mandarins, or those who are called to the inferior offices in the courts of judicature and the finances, are appointed to the government of the lesser cities, and preserve the good order and tranquillity of the state. The difference of subordination in these several classes is such, that the mandarins of the three first classes can order the bastinado to be given to the inferior ones.

As the mandarins are the representatives of the sovereign, a proportionate homage is paid to them, and the people address them on their knees when they are seated on their tribunal. Those of higher classes have always a pompous attendance when they appear in public: four men carry them in a magnificent chair, the officers of their court walking before them, some carrying an umbrella, and others beating on a copper basin, to give notice of the mandarin's approach; eight ensign-bearers exhibit on their ensigns the titles of honour, in large characters, of this great man: these are succeeded by fourteen standard-bearers, bearing the symbols of his office, viz. a dragon, phoenix, and other animals; six people then are seen with little tablets, on which are inscribed the virtues of this mandarin; two archers on horseback are also in the procession, riding in front of the principal guards, who carry large hooks ornamented with silken fringe: some carry halberds, some maces, some axes, some whips, some slaves, and some hangers and cutlasses: others carry chains of iron, and at length come two men loaded with a grand chest, containing the seal of his office, while two other persons beat upon kettle-drums. The mandarin then appears, preceded by two standard-bearers and the captain of the guards: he is surrounded by pages and footmen, while an officer holds near him a large handsome fan. The procession is closed by guards and domestics.

It is not the custom for people to manifest their respect, as the mandarin passes along, by acclamations, or bowing their bodies, but by standing in a fixed posture, and by a reverential flame. When he goes out in the night time, instead of flambeaux there are several large lanterns, on which are inscribed his title and qualities.

The mandarins being considered as the protectors of the people, it is required of them that they be easy of access, not only at their stated times of audience, but every hour of the day and night: the palace, therefore, of a mandarin is always open; and at one of the palaces there is a kettle-drum, which the people beat for admittance when they have occasion to apply to him; however, if the cause of application be not of real consequence, the applicant receives the bastinado.

The mandarins are debarr'd the indulgence of the common fashionable diversions, by the laws of the empire, such as gaming, frequenting public walks, assemblies, &c. and if the least disturbance happens in a province,

vince, the mandarin must by some means or other immediately suppress it, or he is almost sure of being deprived of his government. If a robbery or murder be committed, he is obliged to find out and bring to justice the offender. If the crime be parricide, all the mandarins of the district are turned out of their offices, because it is supposed that so heinous a crime could not have been committed, had the mandarins been more generally careful of the people's morals.

If a general insurrection happens in a province, the viceroy of such province is deemed accountable and even culpable for it; it being in this case a maxim of government, that he has either oppressed the insurgents, or connived at the oppression of them by his officers; for that a people governed by upright magistrates, can have no occasion to be discontented and riotous.

The Chinese law ordains, that no person shall enjoy the copious and dignity of mandarin in any city or province where he was born, or where, with regard to relations and friends, he may have any particular connexions; in short, two persons of the same family must not be mandarins in the same district, in order that they may act with the greater impartiality and justice. If a mandarin has the character of a covetous or a mercilefs man, he not only exposes himself to the hatred of the public, but likewise incurs the displeasure of the court: and if he hopes to be continued in his office, he must acquit himself with moderation and disinterestedness in the discharge of his duties, the government watching with incredible vigilance into the conduct of their magistrates. The emperor sends inspectors into the provinces, who go disguised into the respective tribunals while the mandarins are sitting there, and enquire secretly of the people how they behave in their offices; and if he hears of any mal-practice, he discovers the engines of his dignity, and declares himself the emperor's enemy. He then transmits to court the information he has received, and the offending mandarins are brought to punishment. These inspectors of provinces, are persons looked upon as possessing very liberally the distinguishing qualities of justice, honour and humanity: the emperor himself, however, sometimes visits a province; and in this case, the mandarins tremble with apprehensions relative to the cause of his visit.

Once in three years there is a kind of general review of mandarins: the superior magistrates enquire strictly into the conduct of those of the inferior classes, and transmit to court what they discover, to the end that the just and upright may be properly rewarded, and the iniquitous as properly punished.

If a man should be committed to prison by order of a mandarin, and should die in gaol, the mandarin is obliged to send immediate intelligence of the event to court, with a well-attested certificate that he, the mandarin, was in no wise the instrument of the prisoner's death; but on the contrary, had procured him all necessary relief during his illness, and had visited him personally.

Notwithstanding, however, the general vigilance and care of government, the mandarins too frequently violate the laws of justice and humanity; there is no artifice, which the inferior officers in particular do not practise to deceive the superior mandarins; these will impose even upon the supreme tribunals, and cause the emperor himself to be misled. They so craftily veil their knavery, and in their memorials affect such an air of uprightness and public virtue, that it is not easy to avoid being deceived by them.

The military government of China is under the direction of an order of mandarins called the mandarins of war, of whom there are five classes, viz. the mandarins of the rear-guard, the mandarins of the left wing, those of the right wing, those of the main body, and those of the van-guard. These five classes are under the jurisdiction of so many courts or tribunals, which are all subject to a sixth, viz. the fourth sovereign court at Peking, which is entrusted with the care of the military of the empire. The president of the sixth tribunal of war is always a grander of the realm; his authority extends to all military persons; to him belongs the supreme command of the army; but, should there be a war, the Chinese law prescribes, there shall in such case be joined with him in commission a mandarin of

letters, bearing the title of superintendent of arms; and there must be likewise appointed out of the same order, two inspectors of his conduct. The generalissimo undertakes no enterprise without the consent of these three officers, who send a particular account of his operations to the fourth supreme court at Peking, that awful tribunal, to which even the general himself is accountable. These mandarins, or officers at war, are computed at no less than eighteen thousand.

SECT. XIV.

Of the Mode of Taxation in China; of the penal Laws, and different Methods of punishing Offenders; the Prisons, and quick Dispatch of Trials.

THE mode of taxation in China is well regulated: every citizen, from the age of twenty to sixty, pays a tribute proportionate to his income; if any persons neglect to pay, they receive the bastinado, or are thrown into prison; and sometimes a certain number of such aged poor are quartered upon them, as government would otherwise have to maintain; and these live upon them at free cost till the emperor's demands are satisfied. The taxes are sent to government partly in coin, partly in silks and other merchandize, and partly in salt, wood, coal, and other necessaries. One part of the royal provisions sent in, is distributed to the emperor's officers, who receive weekly or monthly a certain quantity of rice, fish, meat, salt, coal, &c. The remainder of the imperial stores is delivered out in like manner to the princes, the ministers of state, the mandarins of Peking and of the provinces, to the soldiers, and to others.

As to the penal laws of this country, theft is never punished with death the first or second time; the criminal is only burnt in the arm with an hot iron; for the third offence, however, he surely dies. The three capital punishments are, strangling, cutting off the head, and cutting a person in pieces; the first of these is looked upon as the most favourable, as the latter is the most dreadful and shocking; for the criminal, whose fate it is to be cut in pieces, being tied fast to a stake, the skin of his head is stripped over his eyes, that he may not be the spectator of his own tortures.

Adultery is punished with the bastinado; and the sentence for murder is either beheading or strangling; the latter of these is accounted the least ignominious; for the Chinese annex the idea of great infamy on the punishment of beheading; and the reason they assign for it is, that nothing more disgraceful can possibly happen to a person dying, than not to preserve the human form as entire as it was given them by nature. Those who suffer this death, are not allowed the usual ceremonies of interment.

Slaves cloping from their masters are marked in the left arm with a burning iron, besides receiving an hundred lashes.

The bastinado and the whip are the most common punishments. The delinquent is laid flat, with his face to the ground, and receives twenty, forty, sixty, or an hundred strokes on his naked back. After the whipping is over, the sufferer is forced to fall at the feet of his judge, and return him thanks for his merciful correction. The number of stripes given to an offender, is proportioned to the nature of his offence; and as this bastinado and whip are inflicted for trivial crimes, and such as even the mandarins themselves are liable to, they are not considered as infamous. The emperor himself sometimes commands this punishment to be inflicted upon great persons, and afterwards admits them to his presence as usual. Scurrilous language, or fighting with the fists in the street, will incur this chastisement; nay, even if a common fellow on horseback does not dismount when a mandarin appears, or crosses the street in his presence, he receives eight or ten strokes; which is performed with such expedition, that it is often done before those who are present know any thing of the matter. Masters use the same correction to their scholars, fathers to their children, and grandees to their domestics. The chastising instrument is a split bamboo.

Another

Another instrument for punishing offenders is the cangue; it is a wooden collar or portable pillory, made of two flat pieces of wood, about two feet broad, and five or six inches thick, so hallowed as to encircle the neck, and rest upon the shoulders. When this instrument is fastened round the neck, the culprit can neither see his feet, nor put his hand to his mouth, but is under the necessity of being fed by some other person. This uneasy confinement he is forced to bear both day and night; it is heavier or lighter in proportion to the offence committed; some of them weigh two hundred pounds; the common sort weigh fifty or sixty pounds.

To prevent the sufferer being set at liberty by any person, the magistrate causes a paper to be palled on where the two halves join, sealed with the public seal. For some offences the delinquent is sentenced to wear the cangue for several months, and to appear with it in the public market, which is considered as a mark of the greatest infamy.

Sharers, gamesters, and disturbers of the peace, are often punished with the cangue; but they contrive various ways to relieve themselves, as by their friends walking on each side, and bearing the weight on their shoulders, by chains so framed as to support the cangue; some by kneeling rest the collar on the ground, and thus give themselves a temporary relief; and when they go to rest at night, their friends have some contrivance for them, so as they may lie at full length.

In treasonable cases, in order to extort a confession from the party, they use a kind of rack for the feet and hands: and there is still a much severer torture sometimes used on these occasions, which is opening the skin with scissars, and raising the flesh.

We must not omit to observe here, that the office of executioner in China is so far from being attended with any disgrace, that it is esteemed an honourable employment: he at Pe-king wears a girl even of yellow silk, which is the badge of the emperor's service; nay, one of the distinguishing ornaments of the princes of the blood; and his instrument of punishment is wrapped in silk of the same colour.

The prisons in China are spacious, commodious, and clean: the usual number of persons confined in the gaols of Canton only, is computed at no less than fifteen thousand: these are allowed to work at their several trades and occupations for a subsistence; for they are not maintained at the charge of government. The women prisoners are never kept with the men.

The Chinese have a very expeditious mode of dispatching their trials: they have no counsellors or lawyers: every man pleads for himself. The plaintiff draws up his grievance in writing, and takes it to the palace of the mandarin, where beating on the drum at the gate, he immediately receives admittance. He then presents his declaration to an officer of justice, who takes it to the mandarin, and the adverse party is forthwith sent for; who, if found guilty, is immediately haled; but if the plaintiff be wrong in what he alleges, he loses his cause, and is haled himself.

SECT. XV.

Of the Ecclesiastical Establishments in China, as professed by the different Sects of Confucius, Lao-kiun, and Foe; of the Sect of Lama, of the State of Judaism and Mahometanism; and of the Institution, Progress, Persecution, and Suppression of the Christian Religion.

THE Chinese are divided principally into three sects, which may be considered as professing so many different religions; superstition, however, which in other countries hath established despotism, and subverted legal government, has no influence in China.

One of the above three sects acknowledges Confucius for their founder: the second, Lao-kiun, and the third Fo or Foe.

Confucius was born five hundred and fifty years before Christ, in the kingdom of Lou, which is now

the province of Chan-tong; he was contemporary with Pythagoras. In his morning of life he gave proof of a liberal genius, and, as he advanced in years, applied himself wholly to the study of philosophy, particularly to the ethical part. When he was nineteen years of age he entered into the marriage state, and after having one son by his wife, parted from her, in order to devote himself with the greater application to his studies. When he was sufficiently skilled in the sciences, he undertook to teach others, travelling from province to province, and endeavouring to inspire people with the love of virtue, a contempt of wealth, and an aversion to pleasures. Thus, by degrees, his reputation spread through the empire, and he was soon at the head of three thousand disciples, out of whom he made choice of seventy-two to propagate his doctrine in different places. He even prudently avoided giving offence to the prejudices of his country, by a too zealous and violent attack upon its errors; his moderation and candour were equal with his genius and learning. In all his actions, as in all his discourses, he supported precept by example. His system of religion was a system of natural law, which ought to be the ground-work of all religions, the rule of society, and standard of government; he taught, that reason was an emanation of the Almighty, and that the supreme law consisted in the harmony between nature and reason; that the religion repugnant to reason, could not come from heaven.

Confucius, at the age of fifty-five, was elevated to the dignity of first minister of the kingdom of Lou, his native country, which he governed with so much wisdom and respectable authority, that in a little time the face of things underwent a total change; but these happy effects of his good administration and zeal were of no long duration; for the king of Lou, seduced by the allurements of a woman, soon forgot the excellent advice and instructions of his minister. Confucius, therefore, after vainly endeavouring to reclaim him, quitted him, and left his native country in search of wiser princes in other kingdoms; nor had he occasion to travel a great way, for all were ambitious to have him for their guest.

This great and good philosopher died at the age of seventy-three, and had a magnificent monument erected to him near the city of Kio-ku; the Chinese entertain a profound veneration for his memory, and have a chapel dedicated to him in almost every city, wherein the mandarins, and other literati assemble on particular days, presenting oblations to him, after the manner of a sacrifice; honours, however, very contrary to the principles of Confucius, who never allowed of such homage and worship being paid to a creature.

The doctrine of Confucius is the religion of the emperor, the princes of the blood, and of all people of learning and distinction in China.

The emperor, who is sole pontiff, is judge likewise in matters of religion; but as the national worship was made for the government, not the government for it, and as both were designed to be subservient to the ends of the community, it is not the prince's interest to employ the two-fold prerogative lodged in his hands, for the purposes of tyranny.

The Chinese in general, according to P. Du Halde, have clear apprehensions of a Supreme Being: they do not, in their invocations to Tien or Chang-ti, address themselves to the material heavens, but to the King of Heaven.

The emperor Chang-hi, in 1720, published an edict, in which he declared, "it is not to the visible and material heaven that we offer our sacrifices, but to the Lord of Heaven."

And Du Halde observes, that the inscription, Tien or Chang-ti, on the figure before which they offered their sacrifices, was not to be understood as representative of the material heaven; it being solely and purely from a religious reverence to the Supreme Lord of all things, that they forbore to address him under any other name than that of Supreme Heaven, Universal Heaven, &c.

However it may have been asserted to the contrary, it is well known that the Chinese literati frequent the temples, and attend on the sacrifices in common with their

their countrymen; and they declare they address their adorations to one Supreme God.

Lao-kium was born about six hundred years before Christ, in the province of Hou-quang; his marvellous birth, according to the account given of it by some of his disciples, was as follows: his father was a common peasant, and lived to the age of seventy, without ever having been able to obtain the affections of any woman; at length, however, obtaining the love of a good honest dame, about forty years of age, he wedded her; and the most miraculously, without having the least connexions with her husband, proved with child, but was not delivered for upwards of forty years, for her pregnancy proceeded purely from the prolific virtue of the heavens and the earth. At length, however, she was delivered under a plum-tree of Lao-kium, who had hair and eye-brows white as snow; wherefore the people, surprised at his whiteness, called him Lau-tie, or the old infant; but afterwards he went by the name of Lao-kium.

As soon as he attained to the exercise of his natural reason, he applied himself with unwearied diligence to the study of the sciences, and made himself master of the history, laws and customs of his country: he wrote a book entitled *Tau-tie*, containing five thousand sentences, replete with excellent morality. At length, after having spent a life of solitude and sanctity, he died at a place called *U*, where a tomb was erected to his memory. This philosopher constantly preached up solitude as an infallible means of elevating the human soul above earthly things, and of emancipating it from its material chains; notwithstanding, however, this his strict and solitary life, he disgraced all, by teaching that the soul died with the body.

Lao-kium, in order to raise the reputation of his sect, pretended that he had discovered the secret of prolonging the life of man far beyond its usual period; and his disciples even persuaded the people that they had found out a certain liquid, by partaking of which a man might live for ever. The time when this sect flourished most was under the emperors of the thirteenth dynasty, or about the seventh century of the Christian era: it was also in great repute under the nineteenth dynasty, the third monarch of which became a dupe to the delusions of these people, though their impostures were so notorious. The founder of the thirteenth dynasty erected a magnificent temple to Lao-kium; and the sixth emperor of the same family caused a statue of him to be set up in his palace, with great ceremony. The Sectarians of the nineteenth dynasty, as above-mentioned, caused to be diapt, one evening, at the principal gate of the imperial city, a mysterious book, full of magic characters, relative to the invocation of Genii and Demons, and asserted that this book fell from Heaven: the weak monarch went himself to pay his respect to the book, and taking it with a religious reverence to his palace, he there placed it in a gold box. It was at this period that the adoration of demons, and the idolatrous worship of genii, and spirits of different kinds, was first introduced into China; and at this time began likewise the custom of deifying kings and heroes; which mortal divinities were honoured with the name of *Chang-ti*: hence an argument may justly arise with regard to this term, denoting that exalted idea of a Supreme Being, which P. Du Halde apprehends it to signify. The priests or bonzes of this sect are infatuated with chimerical notions of judicial astrology, and the superstitions of necromancy; they exercise various incantations and conjurations, mixing with their ridiculous and impious ceremonies the most hideous howlings, frightful distortions of the body, and confused noise of drums and copper basins.

Foe was born in India about a thousand years before Christ: his doctrine was introduced to the Chinese under Ming-ti, fifteenth emperor of the fifth dynasty, who having in a dream beheld a gigantic figure, sent to the ladies in search of the idol whose representation he had seen.

The messengers that were sent on this curious errand, stopping at a place where the idol Foe was revered, they took away the image, and brought it to China, accompanied by a considerable number of bonzes, who, supported by the sanction of the emperor, propagated their

doctrine throughout the empire, and it is now the most highly favoured sect in all China.

Foe taught the doctrine of transmigration long before Pythagoras, and was the founder of the adoration to himself as a God. His disciples, after his decease, pretended he had been born eight thousand times, and that his soul had successively transmigrated through different animals.

The bonzes, in pursuance of their great master's doctrines, maintain that souls pass into other bodies after death; and they give out, that Foe left behind him five grand commandments, viz. Never to deprive any creature whatever of its life; never to rob any man of his property; never to be guilty of unchastity; never to tell a lie, and never to drink wine.

The bonzes hold, that there are places of rewards and punishments; and they preach up acts of benevolence to monasteries, as particularly profitable to the soul in the next life; maintaining that such pious deeds will absolve from sins, but that if they are omitted, the consequence will be the most dreadful tortures, and the soul will pass through the most disgraceful metamorphoses, such as nogs, dogs, rats, asses, &c. The bonzes find their doctrine of great utility in raising contributions, and enlarging the revenues: to all outward appearance, they lead a life of great austerity; some drag large heavy chains after them, twenty or thirty feet long; while others beat their heads and breasts with flint stones.

P. Le Comte tells the following story of a young bonze: "One day," says he, "I met in the street a young bonze, whose apparent modesty and distress would have excited the commiseration of any body: he was in a chain thick full of nails, with the points towards him, inasmuch that he was obliged to keep himself very steady in his seat, to prevent their piercing his flesh: in this chain two men carried him with cautious care from house to house, stopping at every door, where he implored the compassion of the people: protesting aloud that he had placed himself in this painful situation for the good of their souls, and that he had solemnly sworn not to free himself from it till they had bought up all the nails in the chain. The stratagem had its desired effect."

Le Comte, speaking of two others of these priests, says, "A couple of young bonzes one day fixing their eyes upon some ducks in a farm-yard, fell prostrate before the door of the house, sighing, and wofully lamenting: the wife of the peasant observing them, asked them the cause of their sorrow: O! cried they, in those ducks are the souls of our dear fathers! and we are miserable lest you should dispose of or kill them. I intended to tell them, replied the woman, but since their bodies possess the souls of your fathers, I will not dispose of them. Ah! continued the impostors, but perhaps thy husband may dispose of them! and then what will become of our poor fathers' souls? The woman, affected with their pretended distress, gave them the ducks, that they might exercise their filial care over them: however, in the evening they roasted and eat them."

Notwithstanding the apparent piety and austerity of these priests, they are not respected, but despised, inasmuch that they are under a necessity of redeeming slaves, to train them up to their order, whom they oblige to pass through a very rigorous probation before they are initiated; the novice, for instance, must go about from door to door in a coarse ragged garment, begging alms, and chanting the praises of Nido, to which he is a votary; he must abstain likewise from animal food, and observe an almost incessant watchfulness, his superiors awaking him with great rigour wherever they find him sleeping. When he has gone through his probationary state, he is admitted to profess, when all the bonzes of the adjacent monasteries assemble, and, prostrating themselves before the idol, pray aloud, and chant hymns to the sound of little bells; the novice all this time lying prostrate at the gate of the temple. When this part of the ceremony is ended, the bonzes raise him from the ground, and lead him to the altar, where they invest him with a grey robe, gird him with cord, and put a cap that hath no brim upon his head; then they cordially embrace each other, and depart.

before the incarnation of our Saviour. There were once many families of them, but they are now greatly reduced; they keep close together, and marry only among themselves. They call the books of the Pentateuch by the following names: Berchith, Veeleemath, Vayiera, Vajedabber, and Habbabarim. These five books they divide into fifty-three sections, viz. Genesis into twelve, Exodus into eleven, and the other three into ten each. Gozani, upon comparing their Pentateuch with a bible he had carried with him, found an exact agreement between them with regard to chronology, as well as the age and genealogy of the patriarchs; in other respects, however, the text in their Pentateuch was much corrupted.

Mahometans have inhabited here upwards of six hundred years; they have considerable settlements in many of the provinces, particularly in King-nan; and as they do not study to make profelytes, nor give any cause of jealousy to the state, the government never disturbs them.

Christianity is said to have been planted in China nearly as soon as the religion of Mahomet; it must be acknowledged, however, that it made not the same early progress. Some say that the Patriarch of the Indies sent Christian missionaries to China, in the period of the thirteenth century, in the eighth year of the reign of Tai-tien, about the middle of the seventh century of the Christian era; and that, four years after this, Tai-tien suffered them to preach the gospel in his country. They further say, that in the year 1625, there was found in the province of Chen-si a stone tablet ten feet long and five broad, containing the names of seventy missionaries who came from Judea to preach the gospel to the Chinese, together with a compendium of the Christian faith, all cut in Syriac characters. It is a known fact, however, that towards the end of the sixteenth century, when the European missionaries first set footing on China, they found no remains of christianity in the country. P. Michael Roger, Neapolitan jesuit, first opened the mission in China, and led the way in which those of his order that followed him have acquired so much reputation, by the testimonies they have given of their zeal. P. Michael Roger was succeeded by P. Ricci, of the same society, who continued the work with such success, that he is considered by the junks as the principal founder of this mission. He was a man of very extraordinary talents; he had the art of rendering himself agreeable to every body, and by that means acquired the public esteem: he in some measure reconciled the ancient religion of the country to the first principles of theology, assuring the people that his moral system was the same with that of their celebrated philosopher Confucius, or, as the natives term him, Cum-tu-cu, or Cong-tu-cu. This secured him many followers. At length, in 1723, the Dominicans and Franciscans took the field, though but as gleaners of the harvest after the jesuits; and now it was that contentions broke out: their first disputes, in which, perhaps, jealousy had too great a share, were on the subject of certain ceremonies concerning the worship of Confucius, and some honours paid to the dead; for as in their funeral obsequies they burnt incense, and practiced libations, sacrifices, and several other rites favouring of idolatry, these were condemned by one part of the missionaries, as incompatible with the purity of the Christian faith. Others of the missionaries of a more moderate temper, and who had little hope of raising up this infant plantation to maturity without such indulgencies, were for tolerating these rites, looking on them as things of an indifferent nature, and mere political ceremonies. These disputes were a great hindrance to the progress of christianity, which flourished before the arrival of the Dominican and Franciscan monks. Several years were spent in altercation; and the literati, who possessed all the employments under government, were so obstinately attached to Confucius and the established rites of their country, that no reasonable concessions could ever prevail with them to abate any thing of their superstition, though even their monarch, Cang-hi, granted an edict in 1662, allowing christianity to be preached throughout the empire. Strenuous appeals were made to Rome by both parties of the contending missionaries: at length, in 1704, the holy see decreed, that the words Tien and Chang-ti

should not any longer be applied to the deity; that the tablets, whereon was inscribed the word Kien-tien, or "honour of heaven," should be taken away from the christian churches; that christians should not assist at offerings made in spring and autumn to Confucius and their forefathers; that they should omit to enter the temples erected to Confucius, and thenceforward pay no further adoration to their ancestors; and lastly, that those tablets of their forefathers, bearing the inscription of "the feat of the foul," should be removed from every christian's habitation. This rigid decree was, however, softened by a few privileges: the converts had the liberty of appearing in the halls of their ancestors, and to be spectators of the rites there performed, but never by any means to participate: they had the further indulgence of hanging up the tablets of their ancestors in their houses, with this proviso, that there should be no other inscription on said tablets than simply the name of the deceased. But notwithstanding these indulgencies, this decree of 1704, and a subsequent bull of Clement XI. in 1715, created the utmost confusion. The ministers of state, and the other mandarins, ever jealous of the growing reputation of the jesuits, were continually declaiming against them, and at length, by remonstrances, obtained a revocation of the edict that had been passed in favour of the Christian religion; by which means it fell under persecution in the reign of the very monarch who tolerated it, Cang-hi, and was afterwards entirely suppressed by his successor Yong-tchin, when all the missionaries were banished to Canton, and upwards of three hundred churches were either pulled to the ground or converted to profane uses. From the period of this fatal catastrophe, which happened in 1723, christianity hath been so far from gaining ground in China, that it is now more persecuted there than ever; and the few who have courage enough to appear in its defence, are exposed to the most severe cruelties.

SECTION XVI.

Of the Commerce of the Chinese of their Money, Weights, and Measures.

THE commerce carried on in the fifteen provinces of China, is very little short of that carried on by the most commercial European states.

A well regulated circulation of commodities established through a country of no less than eighteen hundred leagues in circumference, cannot fail to give us a competent idea of a most extensive commerce.

Then several kinds of merchandize find an easy conveyance from province to province through the means of their numerous rivers and canals. In China all are busy, both in town and country; as the high roads are as much thronged as the streets of a city.

The traffic which they carry on from home, is inconsiderable, compared to their inland commerce; Canton, Emoy, and Ning-po, being their only maritime towns of any note for their exports and imports: besides, their navigation is very confined; for they never sail beyond the freights of Sunda, and their common voyages are to Japan, Siam, Manilla, and Batavia.

To Japan they commonly sail in June or July, and carry thither ging-feng, china-root, and rhubarb, as well as silks, furs, sweet-scented wood, leather, and European cloth; bringing back pearls, red copper in bars and manufactured, lace-blades, porcelain, varnish ware, tamber, and gold. The tamber is a species of copper, with some mixture of gold and silver.

The Chinese export to Manilla and Siam, tea, drugs, silks, &c. and receive piastres: a piastre is about the value of a crown.

Their Indian for Batavia consists chiefly in green tea, porcelain, beat-gold, medicinal drugs, and utensils made of yellow copper: their returns are in piastres, spices, tortoise-shells, snuff-boxes, agates, amber, Brazil wood, and European cloth.

This is the chief foreign traffic of the Chinese: sometimes they sail to Achen, Malacca, Potani, Cochinchina, &c.

As to their commerce with the Europeans, it is at present much less considerable than it has been, for as great quantities

quantities of porcelain and varnish wares have been imported into Europe, and especially since the Europeans have learnt to imitate these manufactures, their commodities of this sort have sunk greatly in their value. European merchandize has suffered the same fate in the Chinese markets; for since the French and English have so abundantly furnished them with crystals and glasses of all kinds, watches, clocks, &c. there is little profit to be made of these articles. There is no trading to China with advantage except in silver, for the purchase of their ingots of gold. The principal, or indeed the only staple for European commodities, is the city of Canton: no other port in China is suffered to be open to us.

It is now necessary to treat of the Chinese money, weights, and measures. Copper and silver are their only current metals: gold passes in trade as a commodity, and even silver is not coined, but cut in pieces for particular payments; and in that case it is estimated by its weight alone, and not by any mark or device stamped by authority: capital sums they pay in ingots or bars of silver. Most trading people carry with them a little balance for the weighing of silver: it consists of a small plate to hold the metal, an ivory or ebony beam, and a weight contrived to shift upon the beam, all contained in a commodious case; this balance is much like the file-yard, and is so curious and distinguishing a piece of mechanism, as to give the precise weight of the minutest things, even to the thousandth part of a crown-piece.

The Chinese are very quick at discerning the fineness of silver: 'tis in the purchase of small matters that a difficulty lies; for they are obliged some times to put their silver in the fire, and heat it thin, for the purpose of more easily cutting it: so that counting down the price is frequently the most troublesome part of the bargain. They are aware it would be more convenient to have money minted of a fixed value; but this, they apprehend, would be a temptation for the exercise of clipping, &c.

Copper money is the only sort that is stamped with any character: they do not impress it with the head or image of the emperor; for it would be a dishonour to a great personage for any representation of him to pass through common hands; but they give it different inscriptions, pompously setting forth the titles or names of the imperial family.

The pieces of money in most common use are about the size and value of French deniers, having a square hole in the middle to put a string through; a string of these is commonly one thousand, divided into ten parts by a twist of the string at the end of each hundred: ten of these deniers make one penny French. The metal is neither pure nor beaten, and it being mixed with lead, the money hath a dull colour and no sound.

As these small pieces are sometimes counterfeited, it must naturally be supposed, that if silver was coined in

China, it would be much debased. The counterfeit coin is of less weight, as well as of worse metal; and if the offender be detected, he loses his right hand.

Some of the virtuosi in coins have in their possession pieces that were coined in the earliest dynasties of the empire.

In the reign of Cang-hi, according to the assertions of P. Du Halde, a certain mandarin named Tli-ang was charged with a commission to make a collection of all the old coins he could possibly get, for the purpose of furnishing the emperor's cabinet with them. In the course of this search, continues Du Halde, coins of the first dynasty were not only gathered, but even those of the reign of Yao, who, according to the annals of China, lived before the commencement of the dynasties.

For the more clearly and readily comprehending the value of the money, we shall observe to our readers, that the Chinese divide their pound into sixteen parts, which they call *Lyang*; the *Lyang* into ten parts, which they call *Tiyn*; the *Tiyn* into ten others, called *Fuen*; and the *Fuen* into ten more, called by them *Li*; their divisions reach no farther in the scale of merchandize: but in weighing of gold and silver they carry them on almost to imperceptible degrees, and always in a decimal progression; on which account it is hardly possible to convey an accurate idea of them: they divide their *Li* into ten *Wa*, the *Wa* into ten *Se*, the *Se* into ten *Fu*, the *Fu* into ten *Chin* (or grains of dust) the *Chin* into ten *Yu*, the *Yu* into ten *Myaw*, the *Myaw* into ten *Mo*, the *Mo* into ten *Tiyn*, and the *Tiyn* into ten *Sun*: the possibility of which divisions almost surpasses the power of conception.

As to their measures, they date the invention of these as far back as the reign of Wang-ti, who lived before the dynasties commenced. A grain of millet, they say, was taken to determine the dimensions of a line, or tenth part of an inch, and ten inches to a foot: but, as the form of these grains is oval, and there are different ways of arranging them, hence it happened, they add, that in different provinces some difference is observable in the measures.

They have four different kinds of the foot measure; first, the palace foot, established by the emperor Cang-hi, and which answers exactly to the Paris foot; secondly, the mathematical foot, exceeding the former in the proportion of one hundred to ninety-seven and an half; thirdly, the artificer's foot, which comes short of the palace foot by only one line; and fourthly, the merchant's foot, which is longer than the afore-mentioned by seven lines. P. Thomas, missionary mathematician in China, made use of the first of these feet to adjust the geometrical degree to the Chinese measurement; and according to his calculation, the degree, consisting of twenty of our great leagues, answers to two hundred Chinese *lys*, every one of which contains an hundred and eighty Chinese fathoms of ten feet each.

CHAPTER II.

O R I E N T A L T A R T A R Y.

Of the MANTCHEOUX, *or* MANTCHEW TARTARS.

SECT. I.

Tartary in its full extent; of Eastern Tartary in its
 extent; of the Provinces of Mugden, Kium ula, and
 Tiflikar. Of the Tartars; their Manners and
 Customs. Remarks upon the Utility of this Country.

FROM China, a country covered with populous cities, governed by admirable laws, and inhabited by polished people; we shall lead our readers to a neighbouring kingdom, which seems to be its absolute contralt, viz. Tartary, which has scarce any mannered place worthy of the name of a town in its vast extent. The laws are of little significance in themselves, and are less regarded, and the people very upon a state of barbarism. This country was better known to the ancients, as called it Scythia, than it has been to the moderns. Indeed, in the empire of China, it is a tale of this people, and the late disputes between the Russians and Turks concerning the Crimea, we have been made more acquainted with their customs and manners than for many ages before. Their want of local establishments render a description of them difficult and vague; for in this particular they likewise totally differ from their polite neighbours, as it is certain that a Chinese, when once established, never removes from the place; and a Tartar during his whole life never continues long on the same spot, but is perpetually emigrating from one region to another. We shall now enter upon the full description of this extensive country which the most authentic modern authorities can furnish.

This vast region, taken in its full extent, is bounded on the west by the Caspian Sea and Persia; to the north by Persia, India, Tartary, Arracan, Ava, China, and Corea; to the east by the Pacific ocean; and to the north by the frozen ocean. It lies between the fifty-third and the one hundred and forty-fifth degrees of longitude from London, and between the thirty-seventh and fifty-third degrees of North latitude, being three thousand six hundred miles long, and upwards of nine hundred broad in many places.

One part of this extensive region is subject to the Chinese empire, another is under the dominion of Russia; and the third is independent.

Tartars of different denominations are the inhabitants of this wide, unpopulated, and desert country. The Maanchoux or Mancheux Tartars live chiefly in huts on the banks of the rivers. Their country is in the north of Lao-tong, the most easterly of the Chinese provinces, and is bounded by the river Saghalian-ula on the north, by Corea and Lao-tong on the south, easterly by the ocean, and westerly by the Mongol country. It is divided into three provinces, viz. Mugden, Kain-ula, and Tshu-kai; and hence origin of that enterprising Tartanian trade, which in time trumped on the imperial throne of China.

The province of Mugden, it must be acknowledged, (which is about two hundred and seventy miles in length, and an hundred and twenty broad) hath a favourable soil, producing wheat, millet, and cotton, as well as plenty of pasture for cattle, and several sorts of fruit.

This province and its capital have both one and the same name, viz. Mugden; and in Mugden, the capital, are several public buildings, and courts of justice as at Pe-king.

But the most populous city is Pan-wang-ching, which should may be deemed the key of the great peninsula of Korea.

From Mugden all the way to the city of Pe-king, which is about a even hundred miles distant, there are two large hard-surfaced roads, which are kept constantly in repair, and which were with great labour formed very principally for the emperor, so never it should be his royal pleasure to visit his Tartanian territories. It must be remarked, that one of these roads is for the palace of his majesty to Tartary, and the other for his going back from thence to Pe-king.

Kirin ula, the second province, and which is Liao-tung on the west for its border, the ocean on the east, Corea on the south, and the river Baghalan-ula to the north, is a mountainous district composed of seven hundred and fifty miles in length, and six hundred in breadth. Add to this the fact that the mountains are all rising to be full of the most various kinds of mountains, nor any thing but the most various kinds of waters and tigers. A little more north, the mountains are

There are a few boats taking people across the river Ufui, and fishing principally upon them; these are the Xup's. They imitate the Chinnee in dress, and the women decorate their hair with various ornaments. The Ke-cheng Tartars live after the same manner on the banks of Sanchang river.

Those people, who are ignorant of the facts, are drawn in flocks upon the subject, and every ignorant and uncivilized, and every uneducated man, who is not a member of the Society, is a member of the Society.

The Yup'ik have no television, but do have several radios. The Mup'ik people have a television set, a VCR, a stereo, a sewing machine, and a great number of other household items.

Tutli-kar, which is the capital of the province of E. D. on the Tarty, and the capital of the province of T. D. on the Tarty, is peopled mostly by Chinese. The province of T. D. is a place of tolerable fertility.

The solar Tatars, or *Tatars du Soleil*, are the fiercest and most numerous of the nomads. The women hunt them as well as the men. The object of this game is to kill a man and to take his horse. The women are not allowed to shoot at the enemy, but they are permitted to throw stones at him. The women do not desire to fight, but the husband's livelihood depends on his success in the hunt, activity and rest.

That is why we have been able to get rid of the rivers, and the people who lived along them.

[illegible]

S E C T.

SECT. II.

Of the Religion of the Tartars.

THE religious opinions of the Tartars have never relaxed their natural courage and fortitude: the building of the famous wall of China was a manifest indication of great fear in the Chinese, when the roving tribes of Tartars so much alarmed and annoyed them. Had not the former wanted both spirit and military skill, they would themselves have attacked their daring foes, or at least have kept them in awe by well-disciplined troops.

But to confine ourselves to the religion of these people.

Their religion appears, from monuments of undoubted authority, to be above 3000 years standing, and is founded on the sublimest principles of morality.

The Tartars have in general been followers of the Grand Lama, or Immortal Father, of whom we gave an account in our description of China.

The religion of Lama made considerable progress in early ages; and the authority of this chief pontiff is so highly revered, that the emperors of China, previous to the ceremonial of their coronation, always implore his protection, and send him rich presents.

This worship has not, like the Chinese, been mixed with other systems. The religion of the latter has been often adulterated with foreign superstitions, adapted to the taste of the common people. The Jews have been an end of their hierarchy, and their temple has been destroyed. Tamerlane and the Moguls diminished in a great measure the worshippers of Bramah; and Alexander strove to extinguish the sacred fire of the Gaurs. But neither time, nor the influence of man, hath had the power of shaking the authority of the Grand Lama; who, however, acknowledges that he is no deity, but only a representative of the divinity, and that he is appointed by heaven to decide ultimately upon whatever relates to public worship. His theocracy extends as fully to temporal as to spiritual concerns; but all civil matters, held prophane by him, he considers as inconsistent with his dignity, and commits therefore the care of government to persons calculated for those departments.

There are several worshippers of the idol Foe, who pay an implicit and most humiliating obedience to their priests, making them presents, and attending them as they order or direct. These priests are in general very ignorant, and many of them migrate from place to place, in the service of religion and of themselves.

CHAP. III.

KINGDOM of COREA.

SECT. I.

its Situation, Extent, Climate, and Soil; its Vegetables, Minerals and animals; its Rivers, and famous White Mountain.

COREA, or Korea, is a large peninsula, situated between China and Japan; it is between the thirty-fourth and forty-third degrees of northern latitude. From north to south, Corea is about four hundred and fifty miles in length; and from east to west, it is about two hundred and fifty-five in breadth. On the north side it is contiguous to that part of Chinese Tartary, which is called the Manchoux or Manchew Tartars. Notwithstanding this natural boundary, they have built on this side a high wall as a limit of separation between the two kingdoms. On the west side Corea hath a prospect of Chan-tong in China, from which it is separated by a bay, and over this is the most common passage from Corea to China, the way by the great mountain being almost impassable: in the winter season they cross this bay on foot, it being then frozen over. Corea, on the east and south, is bounded by the ocean.

The rocks and sand-banks along the coasts of this kingdom render the entrance into its ports very difficult and dangerous. To the south-east the land stretches far towards Japan, there being only twelve leagues distance between the city of Poufan in Corea and the Isle of Tsushima, which is under the jurisdiction of the Japanese.

The climate of Corea is exceedingly severe in the northern parts of the kingdom, and the snow sometimes falls in such prodigious quantities, that the people are forced to work a passage under it, in order to go from one house to another; and they fix a small board to their feet, to keep them from sinking into the snow. As this dreary region yields no rice, the inhabitants are forced to live upon barley; and, for the want of cotton, cloath themselves in sheep-skins and coarse hempen cloth. This climate, however, produces great plenty of gin-

feng, with which the natives carry on a very profitable trade to Japan; this gin-feng, however, is inferior to that of Tartary.

The southern parts of the kingdom are fruitful, producing every necessary of life, as rice, millet, and other sorts of grain; also silk, cotton and flax: the Coreans, however, have not the art of manufacturing silk into stuffs. Here grows a kind of grain called Paniz, of which they make a strong liquor. The Japanese, within this last century, have taught them to plant and dress tobacco, the use of which they were entire strangers to before. Here are silver, lead, and iron mines; nor do the natives make an inconsiderable profit of their tiger, fable and cat-skin skins. The country abounds with all sorts of cattle, as well as both wild and tame fowl. They have a breed of horses not more than four or five feet high; they have wolves, tygers, and bears, but no elephants. In their rivers are many crocodiles, or kaimans, as styled by the natives. The back of the kaiman is covered with so strong a coat of scales as to be musket-proof; it has a large head, and a mouth opening almost to its ears. Contrary to all other animals, this creature moves only its upper jaw; its back-bone consists of a long process of vertebrae or moving joints; and in its fins it hath a sort of claws. It is a very voracious animal, and is alike greedy of fish and flesh, particularly human flesh. This country produces likewise great numbers of serpents and other reptiles of the venomous kind.

The kingdom of Corea is divided into eight provinces, containing upwards of two hundred cities, with many castles and fortified places erected on eminences.

The most considerable rivers in this country are the Ya-lu and the Tu-men, both taking their rise in the high mountain that joins Corea to Chinese Tartary, one running to the west, and the other to the east. This mountain, which is one of the highest in Asia, is always covered with snow, and is therefore by the Chinese called Chang-pe-chang, and by the Tartars Chen-alin, or the White Mountain.

S E C T. II.

Of the Natives, their personal Hospitality, their Effeminacy, and Addition to Pleasures, their Drefs and Habitations; their Manners and Customs, particularly their Marriage and Funeral Ceremonies, their Religion, and the Orders of Monks and religious Women.

THE natives of Corea are in general well shaped, and have a comely countenance, and are very friendly to strangers, those excepted who are unfortunately shipwrecked on their coast, for such are barbarously treated by them.

The Coreans are naturally effeminate, much given to pleasure, and very fond of music and dancing. They are, for the most part, weak and credulous, and yet at the same time tricking and deceitful; however, they have, notwithstanding, a law amongst them, by which fraudulent contracts are made void, where there is evident proof of the deceit.

To be war-like is no part of the character of a Corean: he is not ashamed of cowardice, and laments the unhappiness of such as are obliged to fight: he is terrified at the very thought of death, and consequently the life of a soldier is his aversion. He abhors the sight of blood; nor is he less shocked at beholding sick people, especially such as have any malignant disease. The sick are removed into little straw hovels in the fields, where their relations are charged with the care of them, and receive strict orders to warn all passengers to keep at a distance; and sometimes the poor wretches are entirely forsaken, and suffered to perish. When a town or village is visited by the plague, they hedge up all the avenues to such a town or village with briars, and place signals on the infected houses.

The drefs of the higher classes of people in Corea is a purple-coloured silk gown with long and wide sleeves, and a sash or girdle thrown round them; they also wear fur caps and linen buskins. The common clatter wear cotton or hempen cloth.

The houses in the country are very mean, except those belonging to people of distinction, which are handsome and spacious: in the front of these is an advanced apartment for the accommodation of strangers, the receiving of visits, and the giving entertainments; there are generally also belonging to them a grand court, a fountain, and a garden planted with rows of trees. At the lower end of the court are the apartments of the women, into which no strangers are admitted; though the gentlemen, occasionally, suffer their wives to receive visits in the common-hall, and also to sit at table; however, they always sit immediately opposite to their husband.

Both sexes smoke tobacco; even children, five or six years of age, smoke this plant.

Marriages are here prohibited to the third degree of kindred. Sometimes children of seven or eight years old are contracted; in which case the females (an only daughter excepted) are brought up by the father-in-law till the celebration of the nuptials. On the day of marriage the bridegroom mounts his steed, accompanied by his friends, and, after riding through different parts of the town, stops at the door of his bride, upon which her relations come out to him, and then conduct her to his house, where the nuptials are without further ceremony consummated.

A man is allowed by the Corean law to have several wives, provided that he keeps only one at home; a partiality, however, is shewn to the grandees, who often keep three or four at home; but then one of them acts as sole and supreme mistress.

Upon the whole, it is universally agreed, that the Coreans do not in general manifest any particular attachment to their wives; on the contrary, they too frequently treat them not much better than slaves; they not only at their pleasure divorce them, but oblige them at the same time to take along with them their children.

The law relative to inheritance is as follows: The most considerable part of the father's substance devolves to the eldest son; the residue of his effects is equally

divided amongst the other male children, the daughters having no claim to any share in the dividend.

Where the father of a family lives to a very advanced age, it is customary for him to make over the whole of his substance to his eldest son, who in that case takes possession of the family house, and builds a smaller one for his aged father, whom he provides for with all dutiful respect, though he has nothing farther to expect from him.

As to the funeral ceremonies of the Coreans, they bury their dead only at two seasons of the year, spring and autumn: and, till the time of burial arrives, they place the corpse in a kind of hut made of rushes, raised upon four stakes in their court or gardens. The deceased lies in a double coffin, the parts of which are cemented closely together, and is dressed in his best apparel, with some toys lying by the side of him.

When the time and place of burial are fixed on by the priests, who are always consulted upon these occasions, all the kindred of the deceased repair to his house on the evening preceding the funeral, and pass the night in carousing and jollity. At dawn of day they set out in procession with the body, the bearers singing all the way, and keeping exact time with their voices and steps, while the rest of the company pierce the air with their doleful lamentations.

The common people are interred in graves five or six feet deep; but people of rank are deposited in stone vaults, wherein is commonly placed the effigy of the deceased, with an inscription at bottom, displaying his titles, &c.

Three days after a funeral, the company who attended it return to the sepulchre, to make their offering to the deceased; which superstitious practice is repeated monthly at the full of the moon, when they cut the grass growing round the vault or grave.

Children mourn for their fathers three years, during which time no one is allowed to exercise any public office; a man must not even lie with his wife; for should any infant be born during the time of mourning, it would not be allowed to be legitimate by the law: quarrelling, fighting, or immoderate drinking, is, during the mourning, deemed a high misdemeanour.

The drefs of the Coreans, during this term of fasting, is very mean; it consists of a shabby gown of coarse stuff, under which they have a sort of hair-cloth corded, with a twisted band of the same hanging down from their hats, which are made of green rushes. During the whole time of mourning they never wash themselves, and consequently appear very filthy.

No sooner hath any one breathed his last, than his kindred run into the streets like frantic people, tearing their hair, and alarming the whole neighbourhood with their bitter lamentations.

As to religion, the Coreans in general do not concern themselves much about religious worship. According to Hamel, the grandees appear void of all devotion, and rather idolize themselves than their gods; and though the common classes are more religious, yet their worship seems to consist more in external ceremony than inward adoration. The religion of Foë, so much in esteem by the commonalty of China, hath in Corea its votaries also; the country abounds with temples consecrated to this deity: here too are the followers of Confucius.

Upon certain solemn festivals they assemble in their temples, when every one lights a piece of sweet-scented wood, and throws it into a vase placed before the idol. The greatest part of the Coreans believe the doctrine of transmigration, and that there is a future state of rewards and punishments.

There are prodigious numbers of monks in Corea; they inhabit almost every part of the kingdom; and on their solemn festivals the superior of the convent presides, while the rest of the religious assist at their sacrifices; the temple, all the time, resounding with the discordant noise of drums and copper-basons.

Some cities maintain within their particular jurisdiction respectively, not less than four thousand monks; and there are convents containing five or six hundred, which are divided into distinct classes of ten, twenty,

twenty, and thirty each. The senior of the convent is invested with the authority of governor, and has the power of inflicting the bastinado on his inferiors upon any violation of the rules of their order. These monks do not by vow bind themselves for life, as in some other countries, but have the privilege of returning to a secular life when weary of solitude; and it must be acknowledged, that their mode of life is not very eligible; for they are not only subject to a most rigorous discipline, but are forced to pay heavy taxes imposed on them by the state, and are besides held in contempt by the generality of the people. The Royal Monks indeed are better respected; these are such as live about the court, and are often employed in offices of high importance.

All the monks are to go bare-headed, and to refrain from any connection with the female sex; neither are they allowed to eat the flesh of animals. A failure of obedience in these respects, is punished with expulsion from the monastery, besides previously suffering the bastinado.

There are also two monasteries for religious women; the one for daughters of nobility, and the other for young women of inferior rank. These ladies are all shaved, but not confined for life; they have a dispensation from the king to marry, if they please, and leave the monastery.

S E C T. III.

The Esteem the Coreans profess for the Sciences; their Language and Printing; their Method of bringing up Children; their Commerce, and their Money.

THE Coreans profess a peculiar esteem for the sciences; and for this their liberal taste they are manifestly indebted to the Chinese; in geography, however, they are exceedingly ignorant, as will appear presently.

Like the Chinese, they have their doctors and other literati, who distinguish themselves by a double feather in their caps; they pass regularly to their degrees through certain annual examinations in the chief cities, agreeable to the Chinese custom; the assemblage of candidates on these occasions is very considerable; but, unfortunately the images of the electors are for the most part venal.

The greatest ambition of a learned man here, is to attain to the distinguished honour of being doctor of law and of arms at the same time.

In general they are very ignorant, and have the most stupid notions; they think that the globe consists only of twelve kingdoms; their maps extend no farther than Sam. Even the literati entertain the erroneous idea that there are no more than twelve nations in the universe; nor has it been possible to convince them of their error. Indeed, it is a hard task to remove the shade of error, darkening any comprehension unacquainted with the first principles of science.

The Corean language differs from the Chinese, and hath a set of characters peculiar to itself, which women and the common classes of community speak and write; however, the literati affect the Chinese language.

The Coreans have the same method of printing as the Chinese, and they have a national library, which is under the immediate care of the first prince of the blood.

The method of bringing up children here, is free from all levity and harshness; they implant into their tender minds a sense of honour and emulation; they relate to them the virtues of their ancestors, and spur them on to study in the pursuit, by extolling the advantage and reputation of learning; the principal part of which consists in the knowledge of moral philosophy, as prescribed by the great Confucius.

The chief commerce of the Coreans is with the Japanese, more particularly with the islanders of Tsushima, subject to Japan, who have a factory at Poufan in Corea, to which place they bring the scented wood, alum, paper, pepper, buffalo's horns, and other commodities; in exchange for which, they receive cotton and gin-seng.

Pieces of copper called casis are the only species of money used by the Coreans, and these are current no fur-

ther than the frontiers of China; in other parts they make their payments in wedges or ingots of silver, without any stamp or mark on them.

S E C T. IV.

Of the King; of the Civil Government of Corea, and Methods of punishing Delinquents; of the Military Government; and of the Naval Department.

THE king of Corea keeps continually in his service a great number of household troops; these guard his palace, and attend on him wherever he goes.

If any one happens to be in the way where the king is passing, he must instantly turn aside, and not presume to look at his majesty; and the people all shut up their doors and windows; for the king must not be seen by any of them; and should any one be discovered peeping, he would suffer the bastinado.

Thus doth this prince, who is no more than a vassal to the emperor of China, exercise an unlimited authority over his own subject. He is lord of all the lands in his kingdom, no private subject having the absolute right and property of any estate. These lands his majesty bestows on whomsoever he pleases, and for whatever term of years he thinks proper; though, on the death of the scoffee, the land reverts to the crown.

The Corean monarch has a council of state, composed of several ministers; these assemble daily in his palace, though none are suffered to give an opinion upon anything without being asked by his majesty; neither dare they meddle in any state concern without his royal order. If they behave well, and to the satisfaction of the king, they are continued in office during life; and this rule holds good also with respect to other court officers, who, unless guilty of some misdemeanor, generally die in their employments; but such employments do not pass by patent to their children.

Magistrates of cities, and governors of fortified places, are chosen every third year. In case of mal-practices, these are either sent into exile, or sentenced to suffer death.

The royal revenues consist principally in the rents of lands granted to the people; exclusive of this, however, the king has the title of everything productive of profit either on land or sea; the title of the fruits of the earth is collected in harvest-time, before the crop is taken off from the ground.

The penal laws are here exceedingly rigorous. All rebels and traitors, together with their whole families, are cut off without the least gleam of mercy, and the habitations of the sufferers levelled with the ground.

If a wife kills her husband, she is placed up to her shoulders in the earth of some high-road; and close to her is placed an hatchet, with which every one gives her a chop as he passes by her; in short, all passengers are by the laws obliged to do this, except those of noble family. The magistrates of the place where the murder is perpetrated, are suspended from the execution of their office; and if it be a town of note, it forfeits its jurisdiction and becomes subordinate to some other town, or at best, only some private subject has the care of it. The same penalty is inflicted on any town revolted from the obedience due to its governor, or for bringing an accusation against him not founded in truth.

Though a woman is so severely punished for destroying her husband, yet the laws justly and protect the man who kills his wife detected in adultery, or any other capital offence proved by substantial evidence; or if he gives her up to public justice, she is condemned to die, with permission, however, to choose the mode of her suffering death; and in this case the women generally cut their own throats.

It has been asserted by some authors, particularly Hamel, that husbands are likewise punished with death for adultery, especially if they be men of family.

If an unmarried man be detected in time, con. with a married woman, they punish him by stripping him down to the waist, and leaving him only a pair of drawers on; then they smear his face with lime, pierce an arrow through each of his ears, and tie a kerchief on his back, which

which is beat upon as the offender walks through the streets, and then he receives the bastinado.

Homicide committed on the person of a freeman is punished as follows: they oblige the criminal to swallow a quantity of vinegar, with which the body of the murdered person has been washed; then they trample the delinquent under foot, and kick him on the belly till he dies. Theft is punished in the same manner.

The discipline of the bastinado is very common here; it is generally inflicted on the posterior, and sometimes on the thins and the soles of the feet. * When this discipline, say Hamel, * is given on the thins, they bind the sufferer's legs to a couple of benches, the one at his feet, and the other under his hands; and in this posture they strike him on the legs with a sort of lash; they are permitted to inflict more than thirty strokes at a time; however, two or three hours afterwards they repeat the discipline, and so on till they have given the full number of strokes agreeable to the sentence passed. When an offender is sentenced to suffer the bastinado on the soles of his feet, they compel him to sit down on the ground, and then tying his two great toes together, fix them in a wooden frame, and inflict the appointed number of strokes.

Women and apprentices commonly receive the bastinado on the calves of their legs. Persons who are in arrears with the king, or who refuse to pay their other creditors, are sentenced to be bastinadoed on their thins, which dreadful and painful discipline is repeated every fifteen days till they pay their debt or debts.

Criminals are tried by the grand royal council, which is obliged to lay all the particulars of their process before the king.

The execution of the military government in Corea is nearly the same as the civil, each province having a governor, or chief of the militia, with four or five colonels under him; each of them commanding a regiment; and every one of these colonels has many captains, each of which has the government of some fortress or town; in short, there is scarce a village but which has a commanding officer in it; and the inferior officers are obliged to keep an accurate list of all the men belonging to their respective corps, which they transmit at stated times to their superior officers, that the king may know exactly the number of soldiers that he has in pay.

The Coreans always keep a considerable number of ships in commission, and every city is compelled to fit out one complete ship. Their ships of war have commonly about thirty oars, with five or six men on each oar, which, added to marines on board, make a crew of about three hundred men each ship. They are furnished with cannon and pot-granades, and have a particular admiral, who annually the ships of war belonging to the province.

SECT. V.

Compendious History of Corea.

THIS country was originally inhabited by different people, who had each their own respective princes, laws, maxims, and customs. In process of time they united, and formed themselves into one nation. According to the Chinese annals, the most considerable of these early natives were named Kau-kiu-li, descended from the Tartars.

A nephew of Gheou, emperor of China, is related to have been the first king of Corea; he was, however, seized and thrown into a Chinese prison by his uncle, for some misdemeanor; but Gheou being afterwards dethroned by Vou-vang, the founder of the thirteenth dynasty, the nephew, whose name was Ki-tie, was restored to his liberty. He retired to Corea, where he introduced the Chinese laws, civilized his people, and acquitted himself in the public administration of affairs with great prudence and wisdom; not however, without irresistibly harbouring the corrosive reflection that Vou-vang was an usurper, and had deprived his family of the imperial crown. This event happened in the year 1120 before the Christian era.

The successors of Ki-tie enjoyed the throne of Corea near nine hundred years; but at length Tchuan-kiang-vang, emperor of China, subdued the Coreans, and reduced the title of their king to that of Hsin, or count, with a very limited authority annexed. About forty years afterward a prince of the family of Ki-tie, named Chun, resumed the title of king, but was in a very short time dethroned, and at his death the race of Ki-tie became extinct.

A native of China, named Vey-nan, then forced his way to the throne of Corea; and, in order to secure his usurpation, contracted an alliance with the emperor of China, and obtained the title of Vang or King. The sovereignty, however, did not continue a long time in the family of Vey-nan; for his grandson was massacred, and the Chinese profiting by the confusion attendant on this circumstance, conquered Corea a second time. It was, however, in process of time, restored to its ancient monarchical form of government; and the king submitted to pay a tribute to the emperor of China.

Since the last mentioned period, Corea has undergone various revolutions; sometimes being under vassalage to the Chinese, sometimes tributary, sometimes independent, and almost always at war with that nation. It is now, however, tributary to it, and has Corean majesty, on his accession to the throne, receives from the emperor of China, his confirmation upon his knees.

CHAP. IV.

Of the Country of the MONGOLS.

SECT. I.

General Description, Extent, and Climate of the Nation, as far as the Chinese Writers of Credibility See Of the Mongols.

THE country of the Mongols is situated to the north of China, and the natives are of the same race as the Tartars, who accompanied Timur-lane in his conquests of India, Persia, &c.

This country is bounded on the east by the territories of the Manchews, by the country of Kalkas on the west, by China on the south, and by Eastern Tartary and the Kalka Tartars on the north. It is about three hundred leagues in length, and two hundred broad.

The climate is exceedingly severe here, and ice lies on the ground eight or nine months of the year. It is a country not very well known, except that part of it which the caravans pass in travelling from Muscovy to China.

The

The natives are in general of a middle size, but very strongly made, with broad faces, black eyes, flat noses, long whiskers, fallow complexion, and of a most rude behaviour. Their hair is nearly as thick and strong as horse-hair, which they cut close to the head, and leave only a tuft at top; they wear large shirts and calico drawers; and their garments, lined with sheep-skin, reach down almost to their feet; these they fasten on their bodice by strong leather straps. Indeed when on horseback, they wear a short jacket, with narrow deer skin sleeves, having the fur outward; trowsers and hose of the same kind of skin, both of one piece, and light to the limbs. On their heads they have caps bordered with fur.

The women are not quite so coarse-featured as the men, though their dress is much the same as the men wear in common.

The animals inhabiting this country are camels, dromedaries, cows, horses, sheep, mules, elks, bears, tigers, and wolves. There is also every species of game known in Europe.

Rhubarb and other medicinal herbs grow here; and there is plenty of salt and salt-petre.

There are a race of Tartars, called the Kalka Mongols, who are dependent on China; these dwell beyond the Mongols, and take their name from the great river Kalka. Their persons, habits, manners, &c. are the same as the Mongols.

SECTION II.

Further Account of the Nations; their wandering about from Place to Place; their other Customs and Manners; their Dexterity on Horseback; their Contempt for Agriculture; their Government, religious Tenets, &c.

THE Mongols live in little movable huts, formed of twigs covered with matted wool; they have a fire in the centre, with a hole at the top to let out the smoke, and boards or benches round the fire to sit or lie upon. Ever having had an aversion to a settled life, they continually rove about from place to place with herds and flocks. They generally set out in the spring on their peregrination, and their number in one body is frequently ten thousand, preceded by their herds, &c. when they come to an inviting spot, they live upon it till all the grass and verdure are eaten up. The spots on which they fix their tents are commonly the banks of some river or lake, and in the winter they remove to the sides of the mountains, where it is said they are so sociable, as sometimes to make tubteraneous communications from hut to hut.

They eat horse-flesh, and subsist otherwise by hunting and fishing, as well as on the milk of camels, goats, cows, and mares; they drink water that has been boiled with the coarsest sort of Chinese tea; they extract a spirituous liquor from the four milk of mares, and distil it after fermentation; with this they get intoxicated, and smoke a great deal of tobacco.

Horse-flesh, of which they are passionately fond, some of them eat raw, and if it be young and a little tainted, the more palatable and delicious. They are as filthy in their dress as in their food, and stink as they pass; the dung of their cattle they often make use of as fuel.

The supporting a war, by laying waste a country, is a very ancient custom amongst these people. Their tribes are commanded by separate khans or leaders, and they elect a great khan, who consequently claims a

paramount power over all; his residence is a kind of military moving station, and he can bring into the field from twenty to sixty or seventy thousand horsemen.

The grand Chan of Cambalu, as authors relate, controuled the whole mighty regions of Tartary in the days of Tamerlane; and so much did he pride himself on his authority, opulence, and grandeur, that, "each day (says one author) as soon as he was seated to dinner, a trumpet sounded, by way of giving notice to all the other monarchs in the globe that they might also go to dinner."

The Mongols are remarkably dextrous in handling their sabres, and shooting with bows and arrows; they are inured to horsemanship from their infancy, and while in full gallop, split a pole in pieces with an arrow, though at a considerable distance.

These people have the utmost contempt for agriculture, looking upon all bullocks of that kind as the most abject slavery. When they are angry with any body, they wish it may be his fate to work like an ox. When any of them are become very infirm with the weight of years, others of them make small huts for the aged invalids near a river, and there leave them for to speedily journey into the next world, and think that in this they do them a friendly office.

As their whole employment is the attendance on their cattle, which they sell or exchange with the Chinese for ordinary tea, coarse cloth, &c. they are never troubled with much care or anxiety; for they have nobody to please, nor any body to fear.

It cannot be supposed that such a savage race can be under any very regular form of government, especially as they are continually roving from place to place. It must be observed, however, that as their country is divided into districts, and that a each of these hath a khan of its own, the Tartars of one province must not migrate to another; they are to confine themselves to their own nation, where they have full liberty to roam as much as they please.

As to matrimony among these delicate people, the men purchase their wives with cattle; and when the wife is turned of forty, she is employed by the husband as a slave, and as such must attend the young wife who succeeds her.

The Mongols worship the idol Foe, and they have a high priest among them, to whom they do homage, and think that he has the power of obtaining favours from Foe for them. Whenever this priest signifies his pleasure to remove to any particular part of the country, the inferior priests and a great number of other persons attend him; and those who reside on the spot to which he is going, meet him on the road in crowds, supplicating his blessing; which he never fails to bestow upon such as can make him an adequate contribution towards his support; and this he is in no doubt of receiving for his benediction, as he suffers none to approach his sacred person but the higher order of people. This high priest is named Khutucktu; and some of the deluded people think that the holy spirit which animates him, immediately on his death passes into the body of him who is elected to succeed him; which transmigration is perfectly consonant to the doctrine of the metempsychosis, the established system in many parts. Others think that he grows old with the decline of the moon, and resumes his youth with the new moon.

Those who die in their huts, are thrown into a burning pile, and their bodies consumed to ashes, which are afterwards interred on some mountain.

The

CHAP. V.

SIBERIA.

SECT. I.

Discovery, Extent, Situation, and Climate of Siberia; its Rivers, and Mines; with an Account of a surprising Kind of Bone found in that Country.

THE discovery of Siberia was made by one Anica, a native of Muscovy, who having observed companies coming annually from it with furs, resolved to get an insight into their trade, especially as these people sailed down into Muscovy by the river Whitlegda (on the banks of which he resided) to the towns of Ozeil and Ustenga, situated on the Dwina.

Anica found means to establish a correspondence with them, and they suffered him to send some of his children and other relations with them on their return.

Siberia is a country of vast extent, reaching from fifty to sixty-eight degrees north latitude, and is bounded on the west by Russia, from which it is separated by the mountains of Werhotauria, which extend from mount Caucasus, and divides Asia from Europe quite to the Frozen ocean, which bounds it on the north; on the east it is bounded by the Japanese ocean, and part of Tartary, and on the south by the same. It is upwards of three thousand miles in length from east to west, and is about seven hundred and sixty broad.

The southern part of Siberia is the only part fit for human beings to live in: here the climate is mild, and the soil appears as if it would be fertile, if cultivated; but, for want of inhabitants, very little corn is produced. The northern parts exhibit nothing but impenetrable woods, snow-tipt mountains, fens, lakes, marshes, &c. and is withal so exposed to the bleak winds, that it is quite barren and desolate. Not a bird appears to give notice of any change of season: even rooks and magpies quit these deserts, where nature becomes quite torpid. The natives are obliged to make passages through heaps of snow, and the delights of summer are not experienced here longer than about three months, during which short space of time the inhabitants sow rye, oats, peas, and barley, but which seldom come to any satisfactory perfection. Nine months in the year the natives are partly shut up in their cottages, scarcely ever venturing out: fir-trees of considerable height bend under the weight of snow: a melancholy gloom spreads all around, and the stillness is interrupted only by the cries of some wretched travellers in fledge.

As to these dreary regions the Czars of Muscovy banish their courtiers and other great persons who incur their displeasure. Some are banished for a limited term of years, and others for life, with the allowance only of one penny per day, and sometimes without any allowance at all; so that, as they are sent destitute from court, their miserable exiles pass a most dreadful life. They float for their livelihood, and are obliged to send an annual tribute to the Czars; else they are most cruelly punished by tax-masters, who oppress them.

There are several large rivers in this country, the most famous being the Obi, and the Lena; the former empties into the Foul kinds of fish as are to be found in the Obi, trout, pike, carp, and salmon, &c. but the Lena, which flows into the Arctic ocean, is very barren. The climate of the whole is very cold, and the people are very few.

The discovery of Siberia is attributed to the unknown in Europe.

On the banks of some of the rivers is found a surprising kind of bone, like ivory; it hath the resemblance of elephants-teeth, and is of different sizes. When split or sawed, it exhibits a variety of figures, such as birds, flowers, &c. and the longer it hath lain on the ground, the greater is the diversity. Of this bone several trinkets are made and sent to China; and various are the opinions on this very extraordinary curiosity: some call it real elephant's-teeth, which they say have lain there ever since the flood; others think they are neither teeth nor bones, but a kind of fossil ivory; other, that they are the teeth of some amphibious animal, &c. The rivers from Greenland. One author, who differs from these, says, "near the river of Jenica there is a monstrous animal which lives under ground; its teeth have been found on the ground, and are like ivory."

Here are gold, silver, copper, and iron mines; also lapis lazuli, jasper, and leadstones: the iron ores are excellent; the brown iron ore is of a very fine grain, and the loadstone acts upon it only after it has been calcined. The relations lived on very good terms with the natives, and the following year Anica sent more people, who carried with them a variety of goods, exchanging them for furs and other articles; in short, they met with every success they could wish for.

It was in the northern part of Siberia this traffic was carried on in the most clandestine manner, till the Anicians, or family of Anica, secured, by considerable presents, the protection of prince Boris-Godden-off, brother-in-law to Feodor Iwanowitch, the then reigning Czar of Muscovy.

They did not in their deputations inform this prince that they had actually established a commerce in Siberia; this might have cost them their lives; but they only, in a judicious disguise, acquainted them with their adventure, and of the opportunities there were of setting on foot a most profitable trade. Boris was so charmed with this intelligence, and with the presents he had received, that he obtained a patent for their immediately colonizing the parts they were in; which patent also entailed on them and their posterity the lands they were in possession of, without demanding any tribute whatever to be paid by them.

Numbers of other colonists were soon sent to Siberia, escorted by troops; these took with them quantities of silk, trinkets, and other things, and passed through the respective territories, distributing them to the natives, and informing them they were come on an amicable visit from the Czar. They travelled also to the river Obi, as far as the river Obi, in such pomp and state, and attributed their favours to liberality, that the natives formed a very high opinion of them. The Russians learnt their language, and brought several of them home with them, who as soon as they entered Moscow, appeared ravished with every thing they heard; much more so than the natives, who had been so long exceeding in their own country. The Russians frequently had occasion to go to the Obi, and the natives met them in their palaces surrounded by his courtiers, and at other times in his coachmen pulled by his guards, and attended by his domestics.

These people, in that correspondence with their country, were led not to extend all they had seen, and the reception they had met with. The consequence was, that they with great readiness subjected themselves

to the payment of an annual tribute, and about the year 1595 became wholly the vassals of Russia.

At Ibrand Ides however affirms, that it was Samoida only that was discovered in the reign of Feodor Iwanowicz, and that Siberia had been discovered in 1563.

In order to give our readers every possible information, we shall present them with the account of the discovery and reduction of Siberia as related by the above-mentioned author. He says, that after the discovery of Siberia by Anica in 1563, one Termack Timofiewitz, at the head of a numerous gang of Cossacs, ravaged all the country about the rivers Occa and Volga; that the Czar therefore sent a considerable force against him, and obliged him to retire to the mountains which divide Russia from Siberia; that he crossed these mountains, and got into the territories of M. Strogonoff, whose friendship he had the good fortune to obtain, and by whose assistance he embarked with his Landitti on the Tagil, and sailed down that river to the place where it discharges itself into the Tura. Pursuing his course on this river, he seized upon the city of Tumen, surprised Tobolsk, made prisoner the son of the Chan Zutchuin, a boy about twelve years of age, and sent him to Moscow, with the offer of annexing Siberia to the Russian crown; by which he obtained a pardon: he was however soon afterwards drowned, and the Czar sending a number of troops into Siberia, the whole country submitted to his arms.

Having thus far given a general account of Siberia, we shall now proceed to particulars, and describe the peninsula of Kamtschatka.

SECT. II.

PENINSULA OF KAMTSCHATKA.

In Extent, Situation, Climate, and Mines.

THE eastern ocean, which separates Kamtschatka from America, bounds this peninsula on the east, and on the west it has Penfichinka for its boundary, commencing near the southern point of the cape of Kamtschatka, and extending northerly between Oehotksky and the western coast of Kamtschatka. The southern part of Kamtschatka is in fifty-one degrees north latitude, and in one hundred and forty-three degrees longitude east of London. This peninsula is divided into two parts by a chain of hills reaching from north to south, its chief rivers are the Awatchka, the Kamtschatka, the Teghili, and what is called the Great River. Its lakes are extensive and numerous.

The winter here is not very inclement; their spring and summer, however, do not continue more than four months; nor is the latter season by any means agreeable; for as the adjacent hills are covered with snow, the air, even in the middle of the summer, is sometimes pretty cold, attended with frequent rains.

Mines of iron and copper have been discovered in many places; the iron ore hath been found to be compact, of a yellow colour, inclining to red; and, in some parts, black metallic particles have been observed, more compact than the rest of the ore. This ore, when crude, could not be attracted by the loadstone, but became so in a full degree when calcined.

A good iron ore has been also discovered here, similar to that found to the south-west of Echatrinenburg; its surface was found to be covered with a yellow ochre, of a reddish brown in the breakings of its solid parts. The ore, when crude, was not acted upon by the loadstone, though slightly attracted by it after calcination.

The copper mines are like some of those produced on the Rappahin mountains, having the Malachites, under the form of Stalactites and Stalagmites, in their cavities, very beautiful, and capable of being polished.

SECT. III.

Their Timber, Shrubs, Medicinal Plants, Vegetables, Animals, Birds, Fishes, and Insects.

THE natives of Kamtschatka have a choice of timber for a variety of uses, as well as a plenty of herbs of divers kinds: they have also several excellent

plants for medicinal purposes. Bailey, oats, peas, turnips, &c. grow likewise here.

The grass springs up so fast, that they have three harvests, and the blades frequently rise to the height of five feet.

The tame and wild animals of this country are extremely numerous. The wild animals are black and white bears; the first are very common. There are wolves in all the forests, as well as lynxes, houns, elks, and a kind of stag very much like the fallow-deer. The bears never attack a man, unless they find him asleep, when they tear the scalp off the back part of his head, and sometimes entirely destroy him.

There are prodigious numbers of foxes, some white, some yellow inclining to red; some are grey, with a black streak on the back, and are much valued; the white ones however are still valued, as being scarcer. There are the black-chestnut and the black-breasted foxes, and these are in general too cruel to their pursuers, their sagacity exceeding that of the others.

The opulence of this country consists in its fables and ermines; the fables, which are sold at a high price, exceed those found in any other part of the globe: the natives eat the flesh, and esteem it very fine food.

The gulo, or glutton, is also found here; likewise other kinds of beaver, as the atlas, rein-deer, and &c. The natives collect themselves in companies to hunt these animals; they go at the close of the winter, from the month of March to the end of April, taking provisions with them. The glutton, which hath a very fine fur, is a terrible enemy to the deer; it will vault itself from a tree upon the deer's back, and fixing between the creature's horns, tear out his eyes: the afflicted animal, with exertions of strength, gets to the ground, when the glutton rips his flesh, and his bones.

There are great numbers of dogs in this country, which resemble the European, and are much used in hunting; they scratch up the ground for the foxes, and seize the others from their lairs. The dogs are of infinite utility to the natives in drawing their sledges over the snow; they scarce ever lose their way even in the dreadfullest weather.

There are several sorts of amphibious animals; one is the sea-cow, about thirty feet in length, weighing six or seven thousand pounds; the skin of which is so hard, that scarce a knife can cut it with a blow. The flesh of a young sea-cow, properly boiled, has a good taste; the lean part is somewhat like veal, and the fat is like pork. The method of dressing this animal is by an iron hook struck into it by some men in a small vessel; then, by a rope, led by people on shore, the sea-cow is drawn gradually to the land, while those in the vessel cut the creature with instruments in several parts of its body till it expires.

It is not a matter of any great difficulty to take a sea-cow from its element, for it seldom raises its head above the surface of the water, thus making it easy to be often seen.

Here are sea-horses and sea-cats: the latter have long hairs standing out on each side of their mouths like those of a cat, and they weigh from five to eight thousand pounds; their eyes are as large as a bull's, and they will fly at people in boats; even if they are blind, and stones thrown at them, they will not retire, but gnaw the very stones that are thrown: however, when once deprived of sight, there is no great difficulty to be apprehended from them. The male and female differ both in form and disposition; so much in form, that they would be taken for different animals; and as to disposition, the female is mild, inoffensive, and timid. As a proof of this, when an attempt is made to seize a young sea-cat, and the male, by its voice, perceives of it, affords the female an opportunity of taking it off in its mouth; if, in this case, the female should happen to drop it, the male abandons her, and, crying, and diving directly at the female, teases her with all imaginable fury; when the latter strives to escape his rage, by licking his paws, and chewing every part of submission.

SECT. V.

Their Method of Travelling; their hunting of the Bear; the usual domestic Employments of both Men and Women; the Cruelty exercised by the Men when they go to War; the religious Nations of these People; their Law with regard to Murder; their Diseases to which they are subject.

THE Kamtschadales always travel in sledges drawn by dogs; the number of dogs is generally four, which are drove by a whip. The person in the sledge is seated on the right side of it, with his feet hanging over, and is obliged to balance himself with great care lest the sledge should overset. In tolerable roads they can travel a great distance in a short time, carrying with them provisions, &c. they can travel about thirty versts a day; a verst is somewhat less than three quarters of an English mile.

Among other animals they hunt the bear; they use rackets to walk upon the snow with, arming themselves with pikes, and taking dogs with them to provoke the animal. They then wait till he comes out of his enclosure, for they would attack him to great disadvantage while he remained there, because the snow being very firm in that place, the bear would be able to avail himself of all his strength; but the instant he comes out, he sinks into the snow, and while he is endeavouring to disengage himself, the hunters easily destroy them with their pikes.

The following is the manner in which they dress their seal-skins: they first wet and spread out the skin, and with stones fixed in wood scrape off all the fat; then they rub it with caviare, roll it together, and tread on it; they afterwards scrape it again, and repeat the first part of their process till the skin is thoroughly cleaned and soft. Skins of beavers, deer, dogs, &c. are prepared in the same manner.

The men, when not employed in hunting and fishing, weave mats, and construct sledges and boats; and in the spring and summer they procure the necessaries of life, and lay up a store for the succeeding winter.

Making of shoes, sewing of cloaths, dyeing of skins, &c. are the business of the women, who also make glue of the dried skins of fishes, and particularly of the whale. They use a board of dry wood to light their fires; in this board are several round holes, into one of which putting the end of a small round stick, they roll it backwards and forwards till the friction causes the wood to take fire.

The Kamtschadales are arrant cowards, and yet seem to despise life, through an innate kind of stupidity. They never attack their enemies openly, unless compelled to it, but steal privately to their huts, and most barbarously use them, cutting them to pieces, and even tearing out their entrails: these cruelties are exercised with triumph and shouts of joy. Whenever they hear of a foe advancing towards them, they retire to some mountain, and fortify it as strongly as possible: if there be a probability of the enemy getting the better of them, they immediately cut the throats of their wives and children, and then meet their assailants with a frantic rage, fling their wives as dear as possible. Their weapons are spears, and bows and arrows.

The religious notions of these people, they erect a sort of pillar on some plain, and cover it with a parcel of rags. Whenever they pass by this pillar, they throw at it some fish or fish, and avoid killing any kind of beast near it. They think that woods and burning mountains are inhabited by evil spirits, whom they live in great fear of, and make them offerings: some of them have idols in their huts. They have a very imperfect idea of a Supreme Being, and think he can neither dispense happiness or misery; the name which they have for the Deity is Kutchu. They reverence some particular animals from which they apprehend magic, and sometimes offer fires at the holes of fishes; they suppose wolves not to hurt them, and believe such amphibious animals not to overtake their boats. They do not, however, adopt the Russian manners, and are not converted to their country; they have been converted by Russian missionaries, in the Christian

faith; and schools have been erected for their children.

The law of retaliation is observed strictly by these people; if one man kills another, the relations of the person killed destroy the murderer: they punish theft by burning the fingers of the thief.

Before these people were conquered by the Russians they had such frequent intestine quarrels, that a year rarely passed without some village being entirely ruined.

The small-pox makes great havoc here. The fevers, and irregularities of parents, bring a variety of diseases upon their offspring, to which they apply roots, herbs, &c. The venereal disease is very frequent from the manner in which these people live together in their huts, and their excess of debauchery. They have a disorder called the fulhutch, which is a sort of scab, to which they apply the raw skin of a hare to cause a suppuration. Their other disorders are the palsy, jaundice, boils, cancers, &c.

SECT. VI.

The Volcanoes, and hot Springs of Kamtschatka; the manner in which the Kamtschadales are affected by the eruption of the Volcano; the manner in which the Kamtschadales are affected by the eruption of the Volcano; the manner in which the Kamtschadales are affected by the eruption of the Volcano.

IN Kamtschatka there are three volcanoes, the first is that of Awach, to the northwest of the bay of that name; it is a chain of mountains, the base of which is covered with trees and extends to the bay. The middle forms a kind of amphitheatre, and the various summits which are spiral cannot be viewed without exciting the most awful ideas. They always emit smoke, but rarely fire. There was indeed a terrible eruption of smoke and cinders in the summer of the year 1737, but it only continued one day; many of the cinders were near two pounds averdupoise in weight. This eruption was the fore-runner of a terrible earthquake, which happened on the 6th of the ensuing October, and in a quarter of an hour overturned all the tents and huts of the Kamtschadales, burnt accompanied by a singular ebbing and flowing of the sea, which it first rose to the height of 20 feet, then sunk, and returned to an unusual distance; it soon after retired higher than at first, and suddenly sinking again, retired so astonishingly far from the common low water mark, that it was for a considerable time lost to the eye. At length the earthquake was repeated, the sea returned once more, and rose to the height of 200 feet, overwhelmed the whole coast, and then finally retired, after having destroyed goods, cattle, and many of the lives of the inhabitants, and left several lakes of salt water in the fields and lower grounds.

The second volcano issues from some mountains situated between the river of Kamtschatka, and that of Tobolsk. Nothing was ever known to erupt from this but smoke, till the year 1739, when it emitted a torrent of flames, which destroyed all the neighbouring forests.

The third volcano issues from the highest mountain in Kamtschatka on the banks of the river of that name. It is environed by an amphitheatre of lesser mountains, and the head is rendered into long crevices on every side. When a storm is approaching, the summit is surrounded by three girdles of smoky clouds. It continually vomits a combustible smoke, and frequently large quantities of fire. The greatest eruption began September 25, 1739, and continued a week, which with an earthquake that followed did very considerable damage.

Hot springs are found on the southern extremity of Kamtschatka: they form rivulets, and run almost the length of the river Ozemava, which issues from the lake Kurile, and then join that stream; the waters however are not hot to any considerable degree.

Near the river Paudja, is a mountain, from whose summit a prodigious catract of boiling waters fall with a terrible noise, then running to a considerable distance, they continue boiling up to the sea, and at last, till they lose themselves in several lakes, which contain an infinite number of islands. These

mountain the inhabitants obtain some beautiful stones, upon which they set a great value, on account of their admirable variegated colours, which are merely the effects of the different powers of heat, humidity, and friction; for these stones are washed from the mountain, and are polished by the above-mentioned hot and impetuous waters.

A great quantity of fish harbour in the rivers of Kamtschatka during the winter. In the spring, when the ice breaks, they attempt to get to the sea. But the natives watch the heads of the rivers, and take a great number of them in a kind of nets; some they dry in the summer and lay by for their winter food, and from others they extract the fat or oil by means of red hot stones, which they carefully reserve for a great variety of uses.

SECT. VII.

Of the Kuriles, the Koreki, the Tchukotskoi, and the Tungusi; with the Manners, Customs, Dresses, and Habitations of these four distinct Nations of People.

THE Kuriles, who dwell on the southern point of Kamtschatka, are more agreeably featured than their neighbours, and both sexes wear ear-rings of silver: with these they are furnished by the Japanese. They are of small stature and round visage, and pay little regard to uniformity of dress, their cloaths being commonly formed of the skins of different animals. Their habitations are like those of the Kamtschadales, though kept somewhat cleaner, and their provisions are generally the flesh of amphibious animals. These people are more civilized than the rest of the nation, and remarkable for their hospitality and peaceable disposition.

The Koreki, at least the settled Koreki, (for this nation is divided into what are called the settled Koreki and the wandering or rein-deer Koreki,) are imitators of the Kamtschadales in every respect. These people dwell on the coast of the eastern ocean, from the river Ukoï to the Anadit, and along the coast of the Petchian sea.

The Koreki differ from each other both in disposition and form, as well as in their dress and customs: the wandering or rein-deer Koreki are naturally very jealous, and often put their wives to death from the slightest suspicions; and if a man and woman be actually detected in criminal connection, both of them are sure to suffer death: the women therefore avoid setting off their persons to advantage, and never wash their faces or comb their heads. But this is not the case with the wives of the settled Koreki, who decorate themselves as much as possible; and so little does jealousy prevail among this nation, that when one man visits another, he has always the wife or daughter of his friend to lie with.

The wandering Koreki are of short stature, slender shape, with oval faces, large mouths, and short noses. Both the Koreki and the wandering Koreki have black hair; but the former are neither short nor slender as the latter.

The marriage ceremonies of the Koreki are much the same as at Kamtschatka, and they have a great fondness for their offspring, whom they inure to industrious employments from their infancy. Marriage is only prohibited between father and daughter, mother and son; they generally marry into their own family, and pay very little regard to personal accomplishments.

The sledges used by the Koreki are drawn by rein-deer in the winter, who will go near an hundred mile in a day.

As to the funeral ceremonies of the Koreki, they dress the deceased in his best cloaths, and fixing him upon a pile of wood, throw on it his bow and arrow, and then set fire to the pile. He is drawn in a sledge to this pile by a rein-deer, which, while the pile is consuming is put to death and thrown into the fire.

Like the people in Kamtschatka, they live in fear of spirits, which they think hover in woods and on mountains. They sometimes fix the head of a dog upon a stake, and turning the animal's face towards the east, cry, "Take this, and send us something better for it."

They, in their other customs, are like the natives of Kamtschatka.

The Tchukotskoi inhabit the banks of the river Anadit, and extend along the shore, to the north and north east, to seventy-four degrees of latitude; and those who live to the north of Anadit, not being subject to the Russians, often imprison and destroy those who are.

The habitations of the Tchukotskoi are more commodious and warm than those of the Koreki; and when a visitor comes to see them, he is always presented with the master of the hut's wife or daughter, who hands to him a basin of her own urine, with which the visitor washes his mouth; and this he is obliged to do, or he is not looked upon as a friend.

The dress of these people is the same as that worn by the Kamtschadales: their food is the rein-deer and other animals.

The Tungusi consist of various tribes, spread through different parts of Siberia, and are of the old Scythian race; they are distinguished into the Konni Tungusi, or those who use horses; the Oleni Tungusi, or those who use rein-deer; and the Sabatchi Tungusi, or those who make use of dogs.

Both sexes of Sabatchi Tungusi, who take up their residence between the Lena and the Petchinka ocean, go naked in summer time, except just having a small piece of skin round their waists. In the winter they are clothed with deer-skins. They believe an all-ruling providence, but reverence idols of their own constructing. They hang their dead upon the branches of trees, and burn the bones as soon as the flesh rots off, or is devoured by animals or birds.

SECT. VIII.

Of the Jakuti, the Bratik, the Kamski, the Barabinsk, a Mahometan Nation on the River Irutich, and the Offchocks; with the Manners and Customs of these several Nations.

THE province of Jakuti, or Jakutzk, is situated to the north. The cold in this province, and in the other northern parts of Siberia, sometimes increases so considerably in a few hours as to strike men and cattle dead, who happen to be at too great a distance from any habitation as to shelter themselves speedily from it. In common cold weather it frequently happens that some parts only of the body are frozen; in this case, it is usual to rub them with snow, by which the circulation is immediately restored. When such an accident happens to the face, which generally loses all sensation, in this most severe weather the person thus affected must be told of it: for without this necessary piece of service, which people do each other by turns, the frozen part would soon be lost. This severe weather is succeeded by so hot a summer, that the inhabitants are obliged to go partly naked. In the most northern parts, beyond the sixtieth degree of latitude, the earth produces neither corn nor fruit; they are, however, supplied with these necessaries from the southern parts; and they are in want of neither fish nor animal food; for they have a great diversity of the former, and a plenty of tame and wild beasts: and as to fuel they have also a sufficiency or that essential article.

The Jakuti have some corn in their country; they however pay little regard to it; the hunting of animals employing their chief attention.

The town of Jakutzk, on the river Lena, is the capital of the province, and is about four hundred miles from the Frozen Ocean.

The Jakuti form one of the most considerable and numerous pagan nations in all the vast country of Siberia, and are divided into ten tribes, making in the whole not less than thirty or forty thousand persons, all under the dominion and taxation of Russia.

These people believe in a Supreme Being, and have an image of him; the image, however, hath a very ridiculous aspect; it has a big head, and large eyes of coral. They place it in a tree, and cover it with furs: once a year they assemble together, and sacrifice horses, &c. to this image, flinging up the horse's head all round the tree. Then sitting down in a circle, they drink of a

liquor which they call cumises, and get intoxicated with it. They also throw some of the liquor into the air, and into a fire which they light on the occasion. This ceremony is performed in the spring, and is their new-year offering.

They eat horse-flesh without regarding whether it be fresh or stinking, and smoke a great deal of tobacco, which they get from the Russians.

The huts in which they dwell are like those of the other nations, except that their summer hovels, resembling a sugar-loaf, are covered with the bark of trees, joined and embroidered very curiously with horse-hair.

They generally leave their dead in their huts, fluting up the time, and seeking another habitation.

The Bratski Tartars dwell near the Lake Baikal, many of whom are good mechanics, and others well skilled in agriculture. The food of these people is venison and horse-flesh, the latter of which they prefer. Some of the Bratski are people of considerable property; it is not uncommon for a man to be proprietor of five or six hundred horses, as well as of numbers of other cattle.

The Kamtsi natives dwell further westward, who live in the same manner as the Bratski.

Still further westward is the vast desert of Baraba: that is inhabited by the Barabinskis; in summer, however, they quit their quarters and repair to the banks of rivers. Their hovels which are low in the earth, with the roof rising two or three feet above, are covered with the skins of animals or with rushes. As there is no water in the desert of Baraba, the liquor of these people, during their residence there, is melted snow; they also drink mares milk, as indeed do most of the other Tartars.

Along the river Irtsch there is a nation of Mahometans, who keep numerous herds and flocks; these pay a tribute to Muscovy, though they are governed by princes of their own. They resemble the ancient Russians in their dress, and the women wear rings in their noses.

Along the rivers Oby and Jenisy, still further to the west, live the Offices, and who indeed extend along other rivers which discharge themselves into the two above-mentioned. In the summer these people dry their fish, which serves them in the winter: they have no rice, but subsist on roots, fish, wild-fowl, &c. Their winter huts are low in the ground, with a roof of bark or rushes; in summer they build on the banks of the rivers, and employ themselves in fishing.

The sledges of the Offices are drawn by dogs, four of which will draw a sledge with goods, we mean upon a nice league in a day. What is remarkable, they have posts in this country for sledges as regular as the posts of Europe, with relays of dogs for travellers to change on their journey at set distances. The greater hurry a passenger is in, the more dogs they employ.

As to the religion of these people, they have small frozen idols, placed in groves, or on the tops of houses. When they make offerings, they present an animal to the idol, and one of them puts up the petitions of those who brought the sacrifice; he then pierces the beast with an arrow, and they all join in killing him: then the animal is drawn round the idol, and some of them sprinkle the blood upon it: they then divide the flesh, and eat it shouting and rejoicing.

SECT. IX.

SAMOIEDIA, or SAMOIEDA.

Of the Natives, their Persons, Dress, Habitations, Manners and Customs, their Method of catching the Sea Dogs, their Religious Notions.

SAMOEDIA, or Samoieda, is situated north west of Siberia, a large province on the Frozen Ocean: it is divided into Obdora on the west, and Manamo and Loppa east of the river Oby: the Rhiphan mountains, surrounding the river Petzora, are its western boundaries.

The Samoiedes, or Samoiedians, are low in stature, broad-shouldered, broad-faced, flat-nosed, with hanging lips, and small ugly eyes; their complexions are swarthy; so that it is observable, an extremely hot or cold

climate hath the same effect on the skin. The hair of both sexes hangs at its full length, and the women's, which is plaited, is adorned with red slips of cloth and brass trinkets fixed to it. The men have scarce any beard.

The dress of these people is a sort of waistcoat and buskin, with a fur cap; also a coat of rein-deer skin; and in the winter they wrap over them a large fur coat, which almost covers them from head to foot; for there is a hood to the coat, which nearly obscures the face; they in this season also wear thick boots; the women too appear in boots, with a kind of petticoat coming half way down their legs.

Their dwelling-places are caves, in which they live nine months in the year, and make subterraneous passages for the purpose of visiting each other: they burn lamps, fed by a stinking fetid fish oil.

In these regions of darkness the Samoiedians lead a life of jollity and mirth, feasting upon sheep, oxen, deer, fish, and horses; and if the food be tainted, the better they relish it: the entrails of an animal they esteem the best part.

Their summer habitations are in the resemblance of a bee-hive, and are covered with the skins of the game they kill, which poison the air with their stench.

In the winter they have skis on their feet, with which they slide swiftly on the ice and hard bodies of snow: they are for the most part a strong, hardy, healthy, active people. They travel in sledges drawn by rein-deer or dogs; the sledges measure about eight feet in length, and about four in breadth, and turn up before in the manner of a skat: the rein-deer have a very pretty appearance in their harness, holding their heads so high, that their horns almost touch their backs.

The Samoiedes are famous for catching the sea-dog. They crawl upon the ice after this animal with a large hook and line, and at a convenient distance throw the hook; when the animal, in endeavouring to avoid the snare laid for it, generally fixes itself in it; the creature, however, though thus hooked, jumps sometimes into the sea with such force and violence as to drag the man into the sea after him. From the sea-dog is extracted an oil, and the flesh is eaten by the natives.

The Samoiedes believe that there is a Supreme Being, and they call him Hey-ha; from him they think every human blessing is derived; that he is our all-merciful and common parent, and will reward those with an happy state hereafter who live as they ought in this world: they however worship the sun, the moon, and stars, and also reverence images, birds, and beasts. They have their priests, who pretend to be adepts in the magic art; wherefore they consult these upon various occasions, who severally deliver their oracular determinations.

SECT. X.

Of the Chief Cities of Siberia.

HAVING circumstantially treated of the chief of those wild uncivilized people who are the inhabitants of Siberia, we shall now present our readers with a description of the principal cities or towns of this country.

Tobolsky, the capital, was built on the side of the old city which had been the name of Siber. It is situated in fifty-eight degrees north latitude, and sixty-seven degrees east longitude from London, contains about fifteen thousand inhabitants, almost all Russians, or naturalized. Of the latter there are several Mahometan Tartars; the greater part of them live without the city, for the purpose of performing uninterruptedly the ceremonies of their own religion.

Tobolsky is divided into two parts; the larger part is situated on the banks of the river Irutsk; and the other upon a hill, the top of which is a kind of platform extending to the east of the town. That part on the hill is fortified, both east and north by a rampart, bastions, and a ditch six feet broad, bordered with palisades. The lower town is in a plain between the hill and the river, and both towns taken together are of a considerable circumference. All the fortifications of the upper town, which is called the city, are on the flat: the southern part of the city, on account of a deep gorge, is difficult of access; as is also the western part.

inhabitants are almost deprived of the light of the sun during the time it remains in the western constellations; they are at that time in almost continual darkness, receiving light only from splinters of birch, which they call couchines: these natives, however, are stout, healthy, robust, muscular, and live to a great age, though it must be confessed an infinite number of children die, especially among the common people, of whose families one third part is scarce ever preserved; parents who have had sixteen or eighteen children born, having often no more than three or four alive; and the small-pox, scurvy, and venereal disease, concur gradually to thin the country of inhabitants; so that unless the Russian government adopts some measure to put a stop to this depopulation, the human species here must soon be extinct.

The women in general of this country are tolerably handsome; and all ranks and ages paint. At Tobolsky in particular the women are extremely fair, and their countenances perfectly agreeable; their eyes are black, languishing, and down-cast, for they never dare look a man full in the face; they wear no caps, but coloured handkerchiefs, which they so curiously interweave among their hair, generally black and unpowdered, that this kind of head-dress gives them a very attractive look. They change their linen but seldom, and are unacquainted with that variety of undress to which the Europeans are accustomed.

The age of the women of Siberia is distinguished by their dress; the old are dressed in the Russian fashion, and the young wear a Russian robe, in the manner of the Polanders. They have flat caps, with their hair hanging down from each side or behind; the cap is adorned with very indifferent fringes of a stuff peculiar to the place, which is bound round in curious circles.

In the houses of people of rank at Tobolsky there are seldom more than two beds, one for the husband and wife, and the other for the children; all other persons in the house lie promiscuously upon benches or mats.

The beds have no curtains; and instead of a bolster, they have seven or eight pillows, one less than the other, raised up in the form of pyramids. This bed is generally the principal piece of furniture.

In 1663, even people of quality used to lie upon bare benches, on which a skin or other covering was spread; there was scarce any furniture in the houses, and very few tables were covered with a cloth at meals.

At Tobolsky the men are extremely jealous of their wives, who seldom go out, but live wholly sequestered from society, and are given up to indolence and laziness.

That species of refined love which flows from sensibility, and predominates over the human soul, is here untraced and unknown. Here a lover has never the satisfaction of seeing the disorder and confusion of his mistress, endeavouring, but unable, to conceal her passion. Such situations are never seen in Siberia. In this barbarous country men tyrannize over their wives, and treat them as slaves, requiring of them the most servile and menial offices: no wonder then that the delicacy of sentiment which characterizes the natives of more civilized countries, is so rarely to be met with here.

Though the men use their wives with such severity, they are very indulgent to their daughters: they think married women should be wholly taken up with their husbands, but that liberty should be given to the unmarried, in order that by that means they may have an opportunity of getting husbands; and the girls very soon avail themselves of this liberty, without either the consent of their parents or the sanction of the church.

There is very little society at Tobolsky; nor is it possible there should be much under a government where no individual enjoys that essential freedom by which

the happiness and welfare of the citizen is secured. A reciprocal fear prevails among people here; whence arise mistrust, dissimulation, and perfidy. Genuine friendship, that sentiment which so powerfully contributes to the common felicity of human beings, glows not in the breast of a Russian.

The people of Tobolsky have no principles of morality: the clergy, who are very ignorant, are as libidinous and drunken as any. They make their wine with plants, drugs, and brandy. We do not wish or mean, however, to establish an unfavourable opinion of the whole body of clergy from this disadvantageous representation of them; there are some among them of irreproachable manners, and liberal capacities.

The higher classes of people never enter into priesthood; by which means there is no intermediate state in the ecclesiastical body; it is made up entirely of the common people, or the children of the priests, who are often the most dissolute; so that the depravity and ignorance of the clergy are the natural consequences of their not having received any principles of education.

The young women of this country, who, as hath been observed, have great liberty given them by their fathers, frequently divert themselves with dancing. Sometimes six or eight couples are seen dancing together, and at other times only two, a man and a woman: most of their dances are characteristic; a lover expresses his passion by the most wanton and lascivious attitudes; his mistress answers him with all the graces peculiar to her sex; which are extremely alluring in these girls, as the inactivity of their lives gives them a kind of languor very tender and expressive.

Some of their dances are pantomimic, which the young people perform with admirable dexterity; they turn round on one foot, while they are almost in a sitting attitude; then rising instantly up, they throw themselves into some mimic or grotesque posture, which they vary every moment, in advancing, retreating, or turning round the room. One couple alone generally performs this dance.

Some of the young women amuse themselves in fine weather by twining upon a plank balanced across a beam lying on the ground; they place themselves at the ends of the plank, and alternately raise one another several feet high with great dexterity.

We shall now bid adieu to the dreary regions of Siberia; we shall leave her frozen soil, her dreadful clime, her horror-striking scenes! Now shall we quit a vast gloomy desert, where the thickest coverings of fur cannot sufficiently defend the natives from the piercing cold; where even brandy freezes, though kept in rooms where there are fires; where the ice of the dismal lakes, from the condensation of air, cracks sometimes with a noise as loud as a cannon; where men and animals are sometimes struck with death by the cold; where even the smoke from chimnies is at intervals prevented from rising by it; and where birds of all kinds drop dead to the ground.

Here nature, with her blooming verdure, is never seen or felt, as with us, imparting new life into all that breathes or vegetates: no trees are here adorned with fresh leaves, or enlivened with the shrill notes of harmonious birds: the animating lark is not heard giving the signal of the rising morn, or making the air ring with his melodious voice, previous to his dropping upon some bed of flowers. No—dreadful winter reigns triumphant in Siberia.

Notwithstanding all the above disadvantages, there are many small villages upon the banks of the Ob, which are pleasantly situated, have a fine effect upon the eye, and afford some agreeable landscapes, particularly Schorskskoi and Pogost, a perspective view of which will be included in the number of our plates.

CHAP. VI.

WESTERN TARTARY.

This extensive division of Tartary contains several nations or tribes of Tartars, which we shall enumerate and describe under the following heads :

S E C T. I.

The Kingdom of Astrachan.

ASTRACHAN lies between 44 degrees, 10 minutes, and 52 degrees north latitude. The longitude east is 62 degrees, 30 minutes.

It is bounded on the east by the country of the Cossacks, towards the south by Circassia, on the north by the kingdom of Cazan, and part of Siberia. The eastern boundaries are deserts very little known, and not inhabited.

The metropolis of this kingdom is called Astrachan. It is built upon an island in the Volga, known by the name of the Isle of Hares. It is in 45 deg. 13 m. north latitude and 68 deg. east longitude.

This city is commonly supposed to contain 100,000 inhabitants. It abounds in well furnished magazines, and hath a citadel surrounded by a thick brick wall, of about 30 feet in height; though this citadel which lies towards the west of the city is irregularly built, the bastions are strong, and the cannons numerous. Here is a palace for the governor, and another for the archbishop. In the court of Chancery all civil and military affairs are heard and adjudged, and the records are kept. The citadel hath three gates, one opens to the city, another to the Volga, and the third to the Tartar suburbs. It contains likewise a guard house, a Metropolitan church, and a monastery.

This city is surrounded by a wall, between which and the houses is a large intermediate space, upon which none are permitted to build. It consists principally of three long streets from east to west, which are intersected by many others, and is upon the whole about a mile in length. The houses are built of timber, the suburbs are extensive and more populous than the city. There are four churches and a monastery belonging to those of the Greek persuasion. The reformed have a church built of wood; the Roman Catholics have a monastery, and the Armenians a church of stone. Without the suburbs are a naval and military hospital, and a large monastery.

No Tartar is permitted to stay all night in the city. Armenian and Russian merchants inhabit the eastern suburbs, and the Indians are permitted to live in guarded Caravanserai.

Astrachan is garrisoned by five regiments of infantry and one of dragoons; many field regiments, and Cossacks, exclusive of the Tartar militia, winter here, besides the garrison itself.

The use of the regulars is to march against the wild Tartars whenever they attempt to make any incursions into this kingdom, and the irregulars are employed to scour the deserts, in order to trace out the lurking places of the banditti.

The commerce of Astrachan consists chiefly in silks, brocades, velvets, satins, drugs, copper, cotton, Persian fruits, wines, sweetmeats, &c. which they import; and in return export meal, fish, salt, woollen, &c. all naval and military stores are prohibited from being exported to Persia.

The merchants of Astrachan have permission to navigate the Caspian sea, besides which they always keep

a great number of barks on the Volga; formerly these barks were frequently robbed by a strong body of pirates, who either lurked in the immense woods near the banks, or on the islands in that river; but this evil is now pretty well remedied; as the lawless banditti who spread so much terror in Astrachan have been almost exterminated by the care of the governor of Casan.

The punishment for pirates who rob on the Volga, is to be hanged up alive by the ribs, upon gibbets raised upon floats, where they are left to expire in the agonies, and if any persons relieve them, they are themselves liable to suffer the same punishment.

Near the city of Astrachan, Peter the Great had a large mulberry garden, and designed to establish a silk factory, but the building and gardens are fallen to decay, and the money intended to carry on this design has since been applied to more courtly and venal, though less noble and patriotic, purposes.

In this place the Russians, who compose a principal part of the inhabitants, are in the chief offices of state; the Georgians, who profess the Greek religion, are fond of serving in the army; and the Armenians, who in persons, dispositions, and features very much resemble the Jews, have no other ideas but of scraping money together by the means of traffic. As for the Persian and Tartar inhabitants, they are too fond of indolence and roving, to think of any thing else, unless compelled to it by absolute necessity.

The soil of Astrachan is light and sandy, but so much impregnated with salt as greatly to add to its sterility. The earth produces no grain, unless it has been overflowed during the winter season. To remedy this want of the Tartars cut trenches in their grounds, which have been under water, and draining them, they soon become fit for sowing, and in a very short time produce abundance of grain or even fruits, which the intense heat of the climate soon ripens.

The natural produce of the country are reeds, liquorice, kail, gentian, aculeata, the herb astrachania, nitaria, &c.

The inhabitants likewise raise melons and pumpions, which they eat with bread. This country likewise produces fine grapes, the flavour of which in eating is delicious, but the wine made of them is too sharp, which proceeds from the saltness of the earth. The mulberries are unwholesome. The garden vegetables are good, but are obliged to be continually watered, as much to wash the salt from them as on account of the heat, for the salt lies upon the surface of the earth every morning like an hoar frost.

All the same kinds of tame animals which are found in Great Britain, abound in Astrachan, besides which they have a great variety of wild ones; such as wild boars, elks, red and fallow deer, antelopes, hares, wild horses, &c.

The antelope is of a light grey colour, of the size of a deer, with a head resembling a cow, but the nose is without gristle. It has fine black eyes, yet is purblind, the horns are beautiful and without branches. They are taper to the top, and have rings at equal distances, the flesh is tender, but seems to taste of musk.

Here

Here are pelicans, corovaikas, swans, ducks, and all kinds of fowls that are to be found in England.

The Volga is replete with a great variety of most delicious fish; but there are but few reptiles in Aftrachan, and none worth particularizing.

The Russians, Armenians, Georgians, &c. who inhabit Aftrachan have the same customs and manners as the people of their respective countries, but the real natives, or Nagai Tartars, greatly differ from the others in many respects.

They live in huts formed of canes, or bullrushes, at the top of which a hole is made to let out the smoke; their fuel is turf or cow dung. These huts, which are about 12 feet in diameter, they cover in cold weather with coarse cloth, and remain shut up with their families till the sky grows more serene; in the summer they move from place to place for the benefit of fresh pasture for their cattle; when they travel they load their camels, horses and even oxen with their wives, children, huts, and utensils. They pay no taxes, but are obliged to serve in the Russian Wars; and some of their chiefs are always left in the castle of Aftrachan as hostages for the fidelity of the rest.

They have olive complexions, large faces, little or no beard, are low of stature, and inclined to corpulency. They shave their heads, wear a coarse grey caftock, and over it a sheep-skin cloak, with the wool outwards, and a cap of the same materials. Their women wear linen, and a cap with Russian coin hanging round; with respect to their persons and features they are tolerable.

They are in general Mahometans, and devote their offspring to God or some saint. The males wear a ring in the right ear, the females in the nose; the rings worn by the latter are usually set with a piece of coral, a ruby or turquoise.

Hunting, fishing, and their cattle support them. Fish dried in the sun is used instead of bread, though they sometimes make cakes of rice, millet or meal, which they fry in oil or honey; they drink water or milk, but mare's milk they prefer, and are exceedingly fond of camels flesh and horse-flesh. Their camels have two bunches on their backs, their sheep, like those of Persia, have very fat tails, and their cattle is exceedingly large.

SECT. II. THE KALMUCKS.

THE Kalmucks are the inhabitants of a prodigious desert, which lies between the rivers Don and Volga.

These people are continually roving about; in the winter they usually retire on the borders of Circassia; they proceed northerly in the spring, and return back again at the latter end of Autumn. They never cultivate any land, their only riches being their flocks and cattle, on whose account they principally roam about in search of fresh pasture.

Their temporary or moving habitations, are huts, which the poorer kind cover with reeds or rushes, and the better sort with felt.

They are divided into different hordes, each of which hath its chief, but all are subject to one sovereign who is called Chan. This Chan has an agent or envoy in Aftrachan.

Though the Russians claim them as their subjects, the Kalmucks always assert their independence, but admit that they are happy in the friendship and protection of the Court of St. Petersburg. And a Russian resident attended by a guard of 300 soldiers always resides in the court or rather camp of the Chan.

They believe in one God only, are fond of keep-

* It is astonishing that within the last 30 years, neither the account of the suppression of the Kalmuck's mode of burial mentioned in any of our SYSTEMS OF GEOGRAPHY; nor the real method in which they formerly used to bury their dead; which evinces, that the writers of many Systems of Geography were mere copyists from the antiquated and stale works of obsolete and inaccurate authors; otherwise they must have known, that the Kalmuck Tartars never buried their dead in the manner they have described; but that the number of dogs who devoured

ing holidays, and are tolerably decent in their mode of worship. However, they keep idols about them, but pretend not to pay them any kind of adoration, but only to treat them with respect out of regard to the saints they represent. Upon all occasions they affect to profess the Chinese religion, though they know very little of its principles.

They use an odd emblem of eternity during the time of their worship, which is this, a stick of a double gilt spear, of about eight feet in length, is accompanied with a ring, to which a leather thong, with a piece of lead at the end is fastened; during their devotions the end of the spear is placed on the ground, and one of the congregation, with great dexterity, occasions the metal to turn round during the whole time: they likewise sing, and make use of cymbals, and other musical instruments, which are strung; to these they beat time, and look upon notes, which are pricked from the top to the bottom of the page.

They are allowed but one wife at a time: and adultery is severely punished.

When two young people have a mind to marry, they cohabit together for a twelvemonth; if in that space the woman proves pregnant, the marriage is legal; but if the contrary is the case, they are at liberty either to part entirely, or to make another year's trial. The undergoing of such a trial is no ways injurious to the reputation of a woman.

Conjugal infidelity is rarely known among these people. If the wife is caught tripping, she is immediately condemned to death; and the husband, if he thinks proper, may be her executioner.

The priests are neither permitted to have money or wives; for these two reasons: first, they are allowed to supply their necessities from the properties of whom they please; and secondly, they have the liberty of passing a single night with any married woman they chuse; and this is so far from disgusting the husbands, that they take it as a mighty great favour.

The burials of the Kalmucks were perhaps the most singular as well as the most significant of any people in the Universe; they considered the dead for many years, and engaged every element in the concerns of their corpse. In the first place, they buried them, that they might return to their original clay; but before it was possible for the bodies to corrupt, they took them up again, and then threw them into the Volga, but took care to secure them so, that they might easily be drawn out again. After having been immersed in water for some time, they drew up the bodies, and half burned, or rather roasted them, to bring them acquainted with the element of fire; then, that they might not omit the fourth element, air, the carcasses were exposed upon the banks of the Volga, to be devoured by birds of prey, or Tartarian dogs. If they were devoured by dogs, it was deemed a lucky omen; for dogs being looked upon in a sacred light, they supposed that the spirit appertaining to a carcass belonging to any person devoured by dogs, must be in an absolute state of felicity.

This mode of treating the dead has however, for some years, been prohibited by an order from the imperial court of Russia; and the Kalmucks, at present, are compelled to bury their dead in the same manner as the Christians of Aftrachan.*

Though the Kalmucks seem neither to be swayed by ambition or avarice, they are always quarrelling with their neighbours. The Karacalpsaks they have a particular enmity to; to prevent these quarrels, the Russians are under the necessity of keeping a military force upon the banks of the Volga; but these troops are only under arms in the summer time.

the body was immaterial, as all their dogs are looked upon in a sacred light; and that the practice of openly exposing the dead bodies was suppressed in the year 1740, by the intervention and representation of John Cook, M.D. a Scotch gentleman, who was many years employed by the court of Russia in a medical capacity at Aftrachan; and who reported to that court that one of the chief causes of the plague's visiting that country, was owing to the putrid carcasses of the Kalmucks, which were continually exposed to be devoured on the banks of the Volga, and near the city of Aftrachan.

The Kalmuck dogs are exceedingly fierce, and very voracious, and will attack any man who gives them the least offence. In bodies they will assault a number of armed men; but the inhabitants of Astrachan very frequently go out on purpose to shoot them, and in time will without doubt extirpate the whole species.

SECT. III.

OF CIRCASSIA.

CIRCASSIA is that country lying between the Caspian sea on the east, Afoph and the Paulus Mæsis on the west, the high mountains of Caucasus on the south, and Astrachan on the north.

Of this country the southern division is claimed by the Persians, the western is under the dominion of the Turks, and the eastern pays obedience to the Russian empire.

The land has by many writers been reported to be sterile, for this reason only, because they saw no appearance of fertility. But it should be considered that the natives understand nothing of agriculture, and have not the least propensity to be industrious.

The natural richness of the soil is unquestionable, and the surface of the earth when just turned up will produce a plentiful crop.

The capital of Circassia is Kizlaar, which was built by the Russians; the citadel is only formed of earth, but the garrison consists of about 500 regulars, and 3000 Cossacks, the latter of whom are permitted by the Russian government to erect habitations on the banks of the Terek.

Kizlaar is only in 44 deg. north latitude; the air is consequently wholesome and serene.

The river Terek, which flows from west to east, produces a great variety of fish, as sturgeon, salmon, &c. It meanders beautifully through the country till it disembogues itself into the Caspian sea.

Polygamy, and the keeping of a number of concubines is permitted to the Circassians, who profess the Mahometan religion.

These people are lovely in their features, majestic in their persons, and agreeable in their deportment; in their features they are large, and the men make excellent soldiers; however, none but the principal people are permitted to carry fire arms, with which they are very expert, killing at a great distance, making use of balls, and rifle barrels. The common weapons are scymiters, bows and arrows.

The Circassians, who are immediately under the protection of the court of Russia, have chiefs of their own, the principal of whom is styled Becovitch, he is a major general of irregulars in the Russian troops; he is however always ordered to remain in Circassia, where it is imagined his services can be the most essential. Tho' the Circassian princes are exceedingly honoured and respected by the subjects, yet such is their independency of the people that they are not obliged to do any thing at their command unless prompted by their own inclination. The princes themselves are likewise independent on each other, the most considerable of which is the above mentioned Becovitch.

Whatever presents the empress of Russia sends to the Circassian princes, their respective subjects expect a part. If the things are not sufficiently divisible to be distributed, they will have an equivalent in specie, or some other commodity, which may be easily parted among them.

In war all the spoils are divided amongst the troops, the sovereigns being excluded from having any share.

With respect to their subordination to Russia, it is only confined to a formal oath of allegiance, in which they swear to be submissive to a certain number of general laws, as long as their being so continues essential to the good of the Russians and themselves. The imperial court for many cogent reasons seldom interferes with their political, and never with their religious concerns.

Like the Turks, they have harems or seraglio for their women, from which all men except the husband is excluded. These are separate from, though built contiguous to their dwelling houses.

The following singular custom prevails in this country: When the principal lady of any of their princes is in labour, the first Circassian who hears of it, let his situation be ever so menial, runs and places himself at the door of the harem, from whence none are authorised to drive him. When the lady is delivered, if it happens to be a boy, he is richly dressed with the utmost speed, and delivered to the Circassian, who immediately takes him home, and if he is a married man delivers him to his wife to nurse; if he is a bachelor, a nurse must be procured, and the child remains under his inspection and tuition till he is nine years of age, when he is again returned to his parents, who receive him with great rejoicings, and the utmost public ceremonies. The reason which they give for this remarkable custom is, that the child may not be spoiled in its infancy by the delicacies of a court, or the effeminate treatment which he might receive in the harem; but rendered so hardy and robust as to become in time a bugbatter or hero. For courage and personal strength are by the Circassians esteemed as the first qualifications of a human being.

As the respect which the Circassians pay to their chiefs is voluntary, so it is sincere; but a prevailing part of their character is their veneration for ancient houses. They are as great genealogists as the Welch, but more tenacious of their family honour by not intermarrying even for gain, with an inferior.

Whatever may have been said by former writers concerning the marriage ceremonies of the Circassians, they are simply these:

The parents or guardians enter into a nuptial contract; the young couple are then permitted to see each other. After two or three visits, if each party is satisfied, the affair is concluded, and nothing remains but to send the bride home to the bridegroom's house in a close waggon finely painted, attended by the women who are to live with her.

With respect to the contract itself, it falls heavy on the bridegroom, especially if he is ardently desirous of concluding the match; as the bride's relations give nothing with her but a few suits of cloaths; but the bridegroom is obliged to make them presents to a great value of horses, dromedaries, camels, cows, &c. If they happen to demand more than he is possessed of, it makes no difference to him, for he immediately makes incursions upon his neighbours, and steals as many as will make up the deficiency.

The people of Kizlaar carry on a good trade with the Russians for an excellent root called Rubia tinctorum, which is used in dyeing a beautiful red colour. Besides a great variety of useful herbs, this country furnishes the best capers in the universe.

The woods naturally produce vines, the grapes of which are small, but the wine made from them excellent.

Circassia abounds in wild swine, wolves, and foxes; to catch these they use the following method:

After digging a hole in the earth nine feet deep, broad at the bottom, and narrow at the top, they drive a stake into the middle, which projects from the surface of the earth about four feet. Upon the top of the stake a moveable cart wheel is fixed, to which a young pig is fastened in the evening. The mouth of the pit is then covered with branches of trees in a very slight manner, over which grass is scattered.

The pig does not fail to squeak all night, being irritated by its confinement. When any of the above-mentioned animals hear the noise, they do not fail to visit the place, which they no sooner approach than they fall into the pit, where they remain till morning, being totally unable to disengage themselves.

The hare is hunted with hounds much in the same manner as in England, and affords great diversion.

Circassia hath as great a variety of game as Astrachan, but the pheasants in particular are much more numerous.

From Kizlaar the traveller may pass through a great number of Cossack villages, till he arrives at an excellent hot well, where Peter the Great built an hospital for the cure of scorbutic patients.

The hot spring is situated upon a hill, beyond the independent village Bragutkoi, south of the river Terek,

Tercks,

Terek, boiling hot water issues from it, which smells strongly of naphtha, and falls into a basin, the diameter of which is about 12 feet, and the depth three. On the west side there are seven small springs of the same kind of water; and on the east side there is an acid spring. The water of the chief well will boil a fowl in about nine or ten minutes.

In this country provisions in general, and meat in particular, are exceedingly scarce.

About the city of Terki there are a great number of serpents, who make holes in the ground that are extremely dangerous. These serpents are six or seven feet in length, and about the thickness of a man's arm.

There are likewise mice as large as squirrels, which are called jerhuah. Their ears are long, and their fore feet shorter than those behind, which prevents their running swiftly; they, however, can lay their tails over their backs, and leap to a considerable height or distance.

SECT. IV.

Of the River Jaik, the Karakalpaak, Kirgee, and Bakker Tartars.

THE river Jaik, which runs through a desert of a prodigious extent, and at length empties itself into the Caspian sea, hath, at about 300 versets from its source, a strong town built by the Don Cossacks. This, after the river, is called Jaik, and the Cossacks have bravely defended it from the attacks of all the different tribes of surrounding Tartars.

Between Astrachan and Jaik river, there is no inhabited place except the above mentioned town. This vast desert is, however, infested by innumerable hordes of wild Tartars.

Those who wander about the Caspian sea are called Karakalpaaks, to the northward of whom the Kirgees and Bakkers take up their abode. The Kalmucks are continually at war with these tribes.

The Kirgees and Bakkers profess Mahometanism, and being perhaps the most ignorant and unpollished of any who profess that religion, they are of course the most superstitious.

Consonant to these notions in the year 1739, during the war between the Russians and the Turks, they thought they could not do a more essential service to Mahomet, than by injuring the Russians as much as their power would permit. They accordingly fell upon all the defenceless towns and villages of the province of Umfinafskaja; all who were young and vigorous they carried with them, designing either to use them as slaves, or to fill them as such. The old, the infirm, and the very young fell indiscriminate victims to their remorseless fury.

The governor of Orenburg, however, being informed of these cruel depredations, dispatched a body of 5000 regulars and 3000 Cossacks, who marched with such secrecy that they attacked the Kirgee camp in the night, and destroyed the greatest part of those Barbarians, though they were at the time 20,000 strong.

The Cossacks first discovered the river Jaik, and acquired great riches by fishing in it; and after having cured their fish, selling them to the Astrachan merchants for the mart of Russia.

Peter the Great some time before had entered into a scheme for turning the Volga to a political advantage, and gave an exclusive privilege to one Demidoff with respect to the fishing, advancing at the same time 20,000 rubles, to enable him the better to put his design into execution. In a few years Demidoff repaid the money, and became exceedingly rich.

The fisheries carried on in the Jaik river, at length exciting the attention of the court of Russia, they determined to tax the fisheries on that river as well as those of the Volga; proper officers were sent to enforce the tax, who were thrown into the river and drowned by the Cossacks, to whom the very idea of any kind of taxation was abominable. Continual exposts were sent from St. Petersburg to enquire why the officers had not sent an account of their success; but the messen-

gers were treated exactly as the officers had been: at length the court got information of the whole affair; but it was thought the most prudent to wink at it, the Russian ministry having too much sense to quarrel with a set of people whose sentiments insured their independency, and whose situation rendered it impossible to conquer them.

SECT. V.

Of the Ubec Tartars.

US BEC Tartary is situated between the great Moguls dominions which bound it on the south, and the Caspian sea which with Persia is the western confine; it has the country of the Kalmucks on the north, and Tibet towards the east.

The Ubees are generally esteemed as the most civilized of all the Mahometan Tartars, not but they can pillage and rob their neighbours as well as any other Tartarian tribe.

They nearly resemble the Persians in their dress, their boots which are uncommonly large excepted; the chiefs wear a plume of feathers on their turbans, and as well as their khan pride themselves much on being the descendants of the renowned Tamerlane.

Their common food is pilau, or boiled rice, but their greatest delicacy is horse flesh.

They drink a kind of arrack or fermented liquor made of mares milk.

Their language is a mixture of the Turkish, Persian, and Mongol; but they are well acquainted with the Persian language in its purity.

Their arms are like those of the other Tartars, viz. large bows, arrows, darts, and sabres, which they use with admirable address. Of late they have begun to use muskets, and many of their cavalry wear coats of mail, and carry small bucklers.

The Tartars of Great Bucharia pique themselves upon being the most courageous and robust of their whole nations. The Persians, who are not deficient in point of natural courage, look upon them with terror. The women themselves aspire to military reputation; they are strong and well limbed but in their features have all the delicacy of Asiatic beauty.

The horses belonging to these Tartars are not handsome, but they are hardy, indefatigable, and exceedingly swift; they are the best horses in the world for the Tartars to scour the deserts, as they can live upon almost any thing, and a very small quantity of provender seems to keep up their strength.

They are continually at war with the Persians, the fertile plains of Korofan exciting them to make frequent excursions into that rich and plentiful country; but they do not find it quite so easy to penetrate into the dominions of the Great Mogol, on account of the prodigious mountains which intervene.

Those who subsist upon their cattle, or by plundering their neighbours, live sometimes in huts, and sometimes in tents, every tribe forming a camp of its own, and frequently move from place to place as it suits their inclination or convenience; others, who cultivate the earth, and are a little honest in their principles than their wandering brethren, form societies, and live in towns and villages; these latter are either the real Bucharians or descendants of the Sartes, the ancient inhabitants of the country; or the Turkumars, who were settled in the country long before the Ubees or Tartars, properly so called, subdued it. The Ubees in general, however, despise the thoughts of cultivation, and deem it glorious to make excursions upon and plunder their neighbours.

The capital of the country which lies in 39 deg. 15 min. north latitude, is called Bochara. It is surrounded by a mud wall; the houses are built of wood, but the mosques and caravanseras are of brick: it is tolerably populous, but not equal to what it was formerly. The khan is permitted to seize upon the property of whom he pleases, which injures commerce and damps the spirit of cultivation.

S E C T. V.

Of the Crim and Lesgee Tartars.

C R I M Tartary, which was anciently called Taurica Cherfoneus, is surrounded by the Black Sea on the west, south, and part of the east. On the north it has the Paulus Maotis, and lesser Tartary joins it on the north west by a narrow isthmus.

Its greatest extent, from north to south, is about 145 miles; its greatest breadth from west to east, is near 140 miles; and its breadth in other places is only about 85 miles.

It is situated between 33 and 37 degrees east longitude, and between 44 and 46 degrees north latitude.

It is by nature exceedingly fruitful; and with cultivation would be a fine country. There are towns and villages; but the houses are wretched huts. It is subject to the Grand Signior, whom the Khan is obliged in time of war to furnish with 30,000 effective men. These men, however, never receiving any pay, plunder and pillage in every place as they pass through; on which account every man takes three or four horses with him, besides that on which he rides, to load with plunder and captives. Whenever a horse dies, the owner immediately dresses the carcase, and invites his comrades to the entertainment.

In time of peace they purchase beautiful children in Circassia; and sell them to the Turks, who pay for them in clothing, arms, coffee, tea, rice, raisins, &c.

The chief cities, if they may be so called, are Precop, Crim, Arabet, Sachingeri, Caffa, Sidagoy, &c.

They travel in close carts, which contain not only themselves, but their wives, children, baggage, &c.

A painted waggon, and a hut covered with white linen, with a painted cloth at the top, tied with red strings, are all they give with their daughters in marriage; though they expect a handsome present from the bridegroom.

They bury their dead very deep in the ground; erect a tomb of mud over their graves, and adorn it with a variety of flags, expressive of the quality, circumstances, and actions of the deceased.

The country of the Lesgee Tartars extends near an hundred miles in length, from north to south, and about fourscore from east to west. It is fertile and pleasant, producing all kinds of grain and cattle. The people are good mechanics, and carry on several manufactures: they are not only very warlike, but excel in making fire arms, with which they trade into Persia. They are an independant people, and their chiefs, who are named Shamkalla, in any common case of danger, unite their forces, and are unanimous in their operations.

They are active and well proportioned: their eyes are black and full of fire; their complexion swarthy, and their features regular and engaging. They dress after the Arabian fashion, and wear whiskers: some few indeed let their hair grow.

They trade not only with the Persians, but with the Russians and Armenians, giving fire arms and madder for clothing and necessaries.

But though they are fond of commerce, they can rob and plunder as well as any of the other Tartars;

however, if they promise to protect or convey any stranger, they never break their words, or violate the laws of hospitality.

They follow the Turks in their mode of worship, and the Persians in their manners; but in one particular they outdo most of the Oriental nations, for they can drink like Germans.

S E C T. VI.

C O N C L U S I O N.

A F T E R having particularized all the kingdoms, states, and various tribes which compose those vast regions known by, and comprehended under the name of Tartary, a country which extends 4000 miles in length, and 2400 in breadth, it may not be improper to present the whole to the eye in one general view by way of conclusion.

This extensive country seems to be an epitome of the universe. It contains within its limits a vast ocean, viz. the Caspian sea, which in fact is no more than a prodigious Tartarian lake; many other lakes, innumerable rivers, and some navigable, some not; the former contain islands, and both are well stocked with fish. Mountains whose summits reach the clouds; small hills, extensive plains, details of an astonishing circumference; in fine, it includes within its vast limits all the varieties of nature with respect to land and water, and all that the imagination can conceive of the pleasant, the dreary, and the dreadful.

The air hath innumerable variations from the prodigious extent of the country, as it partakes of the frigid temperature, to be found beyond the Arctic Polar Circle, and of the serene climates of France and Italy, and the more luxurious atmosphere of the finer parts of Turkey.

The soil is equally various, and a scale of the Tartarian produce might be drawn, to descend from the height of fertility to the most sterile degree of local barrenness.

In some places not a vegetable fit for use is to be found, nor a pebble that is worth looking at. In others all the luxuries of vernal nature abound, and the mines teem with gold, silver, copper, iron, jasper, lapis lazuli, &c.

The people vary as much as their country or climate, in persons and manners. Those in the western parts, in Circassia, and its neighbourhood, are the most lovely and delicate of the creation. In the middle regions they are less handsome, and in the eastern parts, about Kamtschatka, they are very indifferent. Thus the inhabitants of Tartary, with respect to features and persons, may be included under three general heads, viz. the beautiful, the passable, and the forbidding.

There are two characteristic circumstances indeed, in which all the Tartar nations and tribes unanimously agree. In the first place they are exceedingly fond of that noble animal the horse, either alive or dead: alive, as the most excellent of servants; and dead, as the most delicious of food. And secondly, they have all the same natural propensity, not only to plunder their neighbours, but to rob and pillage each other.

CHAP. VII.

The EMPIRE of PERSIA.

S E C T. I.

Antiquity of Persia, ancient and modern State, Derivation of its Name; Situation, Extent, Climate, Divisions, Mountains, Rivers; principal Cities, particularly Ispahan, &c.

PERSIA hath been celebrated in history from the very earliest ages; but though the people have often been considered as powerful, they could never be deemed happy. Despotism and superstition have always had too much influence in their political and religious matters. Wherever private property is precarious and the human reason misruled, the people must be miserable. Nothing but liberty guarded by wholesome laws, and freedom of thought under salutary restrictions, can render any people happy. From the remotest periods to the present time we find that arbitrary measures have ruined the most powerful states, and depopulated some of the finest regions in the universe, while liberty hath rendered other countries less happily situated, opulent and potent.

It is probable that the word Persia is only a corruption of the word Parthia, and that the modern Persians derive their name from their progenitors the Parthians, the ancient inhabitants of the country: the word itself implies a horseman; the Persians and Parthians having always been famed for their skill in horsemanship.

Modern Persia includes all those countries which were anciently celebrated and known by the names of Media, Parthia, part of Assyria, Hircania, Colchis, Bactria, Iberia, and Sufiana.

It lies between the 45th and 70th deg. of east longitude, and 25th and 44th deg. of north latitude. It is 1300 miles in length, and 1100 in breadth, being bounded on the north by the Caspian sea, which separates it from Russia, and on the north east by the river Oxus, which divides it from Usbec Tartary; the north west boundaries are the Daghestan mountains, and the mountains of Ararat, which divide it from Circassian Tartary; India is the eastern boundary; the Indian ocean, and the gulphs of Persia and Ormus, the southern; and Arabia and Turkey, the western. Thus it is evident that no country in the world is more happily situated for commerce, or better calculated to become a great maritime power; but its natural advantages have always been rendered of very little use by its unhappy political constitution.

The prodigious mountains of Ararat and Caucasus have long made a distinguished figure in history; nor hath that long chain of mountains, known by the name of Taurus, which run quite through the empire from Natolia to India, been less celebrated. These are the only mountains of any consideration in the whole country.

The chief internal disadvantage in Persia is the want of water. There are fewer rivers in this country than in any other of so vast an extent in the world. The only rivers worth naming are the Kur and Aras, they both rise near mount Ararat, and discharge themselves into the Caspian sea. The western boundary indeed is watered by the Euphrates and the Tigris; and the river Indus waters the eastern part; the stream called Oxus does not merit the name of a river; and the few other rivulets are no better than ditches, many of them being the greatest part of the year dry.

However, to remedy the above inconvenience, the Persians have supplied by art what they have been refused by nature: and by the means of a great variety of

canals, reservoirs, aqueducts, and other useful and ingenious contrivances, they seldom know the want of water.

In a country so extensive, the air is of course exceedingly various; but it is allowed that the provinces in general are fertile. Towards the Daghestan mountains, which are continually covered with snow, the air is exceedingly cold; it is very hot in the southern parts; but the midland regions are agreeably temperate, and salubriously pure.

From the distracted state of Persia for many successive years, the political division of the provinces cannot be ascertained; but the most remarkable places in the empire have been visited of late years by several merchants and others, who went upon embassies; the most authentic and interesting of whose accounts we shall blend for the information of our readers.

Ispahan, the metropolis of the Persian empire, and the capital of the province of Erabi, is situated in a pleasant plain, and is defended from the winds by a chain of mountains, which surround it at several miles distance; it is 12 miles in circumference, exclusive of the suburbs; the form is oval, and though the streets are irregular, it certainly merits the name of a magnificent city. It however suffered greatly in point of population and superfluities, by the devastations of Kouli Khan; so that Mr. Hanway, who was there in the year 1743, imagines that not above 5000 of the houses were inhabited at that time.

Previous to Kouli Khan's ravages, it contained 18,000 houses, 500,000 inhabitants, 1,800 caravanseras, 160 mosques, 260 public baths, a great number of superb palaces, and fine squares planted with shady trees. The royal palace, with the offices and gardens, is three miles in circumference; the royal square is near a mile long and about three furlongs broad. The fortifications of this city are however mean and weak, being mostly made of earth, and the moat which surrounds them is generally dry, so that the place is but in a defenceless situation; it is nevertheless not only the best town, but the greatest mart of commerce in Persia, all the trade of the empire centring here; besides the vast quantity of goods of all kinds which are brought by merchants of all the Oriental nations, who deal in musk, ambergris, diamonds, pearl, gold, &c.

The great market place or meidan is 700 feet long and 250 broad; the houses which surround it are uniform, erected with bricks, and the shops vaulted; on the side towards the palace are the shops belonging to the lapidaries, goldsmiths, and druggists, opposite to which are the taverns, eating houses, linen drapers, mercers, woollen drapers, &c.

Through the market flows a rivulet, the channel of which is of stone, by which the water is conveyed to two large reservoirs, that supply the greatest part of the city with that useful article by the means of pipes. On the banks of this rivulet and round the market are planted a great number of ever-green trees, which greatly resemble box, and being regularly cut, so that the shops appear between them, they add greatly to the elegance of the place.

Here are two covered music galleries opposite to each other, where the city musicians play every night at sunset, or whenever the Sophi makes his appearance.

Near the great market place is the bazar, or another inferior market place, which is divided into several streets or other ranges of shops covered over. In this market all sorts of merchandize, and provisions of every

every kind are sold, and the prices are allowed to be reasonable; meat and fuel indeed are rather dear.

Several pieces of cannon without carriages, are planted before the royal palace. This palace consists principally of the festival hall, where the Sophi entertains his nobles on new year's day, and the hall of audience where he receives foreign ambassadors, hears causes, and distributes justice; the latter has not only a spacious court before it, but is in itself exceedingly superb and elegant. At one end of this hall is a kind of alcove, which is separated from the other part by a red callico curtain, which is occasionally drawn up by silk strings, and rests upon the capitals of the pillars, which being of wood are finely carved and gilt, as well as the walls: the floor is covered with a carpet, of a gold and silver ground; the sides are adorned with pictures painted by European masters: in the center is a beautiful fountain surrounded by a number of gold and silver vessels. In its basin many kinds of fruits and flowers are seen floating upon the surface of the water. There are many other spacious apartments in the palace, which strangers are not permitted to survey. Besides the halls there are many smaller chambers, closets, and galleries, some for the entertainment of the officers of the court, who are exceedingly numerous; others for the women: there are many detached offices for the menial servants, and a sanctuary or place of refuge for debtors and criminals. But it is remarkable that almost every apartment hath its own peculiar subdivision of the garden.

Near the palace is a citadel, well garrisoned, and but indifferently fortified, which contains the treasures, ammunition, arms, and stores belonging to the Sophi.

There is a spacious mosque near the south side of the Meidan, built of white marble, in so artful a manner that the eye cannot discover where the separate stones are cemented together: there is a large court before it, in the center of which is a beautiful fountain. Many of the other mosques are remarkable for their elegance and grandeur.

Opposite to the great mosque are many taverns, and tea houses or coffee houses; the latter are held in great repute, but the former are deemed infamous.

In the tea houses people of reputation drink tea and play at chess. To the coffee houses they go to drink coffee, smoke tobacco, and hear the poets rehearse their humorous and satirical compositions.

In Ispahan there are two convents, the one Spanish and the other Italian, which belong to the Augustine and Carmelite friars.

The Sophi's stables are very large; but the most singular thing in them is a high tower, built of earth and the horns of flags and axes, in commemoration of a great hunting match, in which Shah-Tamar killed 2000 of those animals, whose horns were employed in the building.

There are many warehouses in different parts of Ispahan, which are usually built three stories high, with vaults beneath them.

The suburbs are large; and that quarter, inhabited by the Armenians, is supposed to contain 3000 houses and 12 churches; there is another quarter inhabited by Georgians, who, as well as the Armenians, are Christians, and merchants; the third quarter is the residence of the Gebers, or the descendants of the ancient Persians.

The city of Schamachie, the capital of the province of Schirwan, is divided into the north and south city; the walls of the former are standing, but are too low and weak to be of any service in case of a siege: those of the latter were demolished by Shah Abbas. The streets are narrow, the houses low, and built only of earth. The shops, bezar, and two capacious warehouses, are in the south city. The trade chiefly consists of raw and wrought silk, calicoes, &c. The Muscovite merchants deal in Russian leather, furs, copper, and tin: the Circassian Tartars trade in horses, boys, and women, the latter of whom they steal on the Muscovite frontiers. The Jews likewise drive a considerable trade here in gold, silver, brocade, tapestry, woollen, silk, and warlike instruments. There are many colleges here in which all the branches of Oriental learning is taught. The Mosques are large and numerous: the inhabitants use the Turkish lan-

guage in common; indeed, it is generally known all over Persia. The country round this city is fertile and pleasant.

Ardebil, though large, hath neither wall nor fortification; it principally consists of five capital streets; every house hath a garden, or rather orchard, full of fruits; and the streets are regularly planted with elms, which render them exceedingly beautiful and pleasant. The market place is 300 paces in length, and 150 in breadth; it is surrounded with shops, and warehouses, every trade having its peculiar quarter: not far distant is a mosque of refuge where criminals are protected for a limited time; this is the burial place of Iman Sade, a child of their twelve imams. When the time is expired the criminal must again seek his safety in the grand sanctuary, or sepulchre of Sefi, which is at a small distance. At the entrance of the city, a little river divides itself into two branches, the one passes through it, and the other surrounds it; these streams are sometimes so swelled by the melting of the snow from the mountains, that the inhabitants are obliged to divert the fury of their currents by means of innumerable artificial trenches, or the whole city would be overwhelmed by the inundation.

All valuable commodities, such as jewels, gold, silver, brocades, &c. are sold in a handsome square fabric, built upon arches on one side of the market place; there are three gates in this building, which lead into three trading streets, that are covered over, and well furnished with caravanseras, store-houses, and shops.

Sulthania, though greatly decayed, was once a noble city; it still retains many magnificent buildings, the most remarkable of which is a prodigious large mosque, that contains the sepulchre of Sultan Mahomet Chodabende, the founder of the city.

This mosque hath three gates of fine polished steel, which equal in bigness the gates of any church in Europe. The Persians pretend that twenty strong men cannot open the largest of them, without distinctly pronouncing *Break Ali Butscha*, which signifies, *open for the sake of Ali*; but on the repetition of those words, the hinges become so pliant, that a child may manage the gate and swing it open with the greatest ease. The roof of the mosque is of blue and white stones. The tomb of the before mentioned Sultan is surrounded by a grate of polished Indian steel, most admirably wrought: within the brass rails, which separate it from the rest of the mosque, there are several books written in Arabic characters, of three inches in length, with alternate lines of black and gold. The books themselves are near a yard square. The Holstein ambassadors, when in Persia, procured some leaves of them, which are now in the duke of Holstein's library, and contain a paraphrase upon the Koran. At the entrance of the mosque is a beautiful fountain; the tower, which is of an octagonal form, is surrounded by eight other towers. Upon the whole it is a structure which astonishes the imagination and gratifies the curiosity.

There are many other fine mosques in the city, particularly one founded by Shah Ismael, which hath a round tower over the gate, and the court is embellished by a magnificent pyramid, surrounded by eight elegant marble pillars. Near this mosque are the ruins of a triumphal arch built of freestone.

The city of Caswin, the ancient Arsacia, is the principal city of the province of Irak, which was originally the celebrated Parthia: it contains above 100,000 inhabitants, yet hath neither wall nor fortification. Its circumference is about a German league, and its situation in a sandy plain. The houses are plainly built of brick, but are neat and well furnished; the streets are not paved, and consequently dusty; the inhabitants are supplied with water from a neighbouring mountain by the means of pipes. The people shelter themselves from the excessive heats in vaulted cellars, where they likewise preserve ice and snow to cool their liquors.

Here is a royal palace near the market place, which was erected by Shah Tamas; he however afterwards removed the regal seat to Tauris: there is a beautiful garden behind it, and another opposite to it; in the common market prodigious quantities of all kinds of commodities

commodities are sold. The horse market contains many fine buildings; but we cannot omit one singular circumstance which is practised here: as soon as the shops are shut a great number of prostitutes make their appearance, and seat themselves in rows with their faces veiled; the bawds stand behind them with unlighted candles; when a man makes his appearance at any of the rows, the bawd lights her candle, that he may have an opportunity of examining which face he likes; when he has pitched upon one, a bargain is made with the bawd, which being concluded, the couple retire. This, like other large Persian cities, contains many bagnios, caravanferas, warehouses, &c.

The city of Kom, which by Ptolemy was called Guri-riana, hath lost much of its ancient splendour; the walls are in ruins, but indicate its former importance. Its principal trade at present is in a much admired earthen ware, and sword blades, which are deemed the best in the whole empire.

In 33 degrees 51 minutes of north latitude lies the city of Katican, in the midst of a fine fertile plain; this is one of the finest cities in Persia, the houses in general being handsome, and the public structures superior to those of any other city; the country about it is so fruitful, that the very poorest inhabitants live luxuriously. The city is exceeding populous, not only from the great number of natives, but from the vast influx of foreigners, who flock thither from all parts, particularly from India, to carry on trade; the walls and fortifications are made of a kind of potter's clay. The Sophi hath a grand garden here, in the midst of which is a summer palace, reputed to have a thousand doors and windows. This greatest inconvenience in Katican is the want of water, as they have not any but what is ill-tasted, thick, and muddy.

The city of Rischd, which is in 31 deg. north latitude, and in 50 deg. longitude from London, is the capital of the province of Ghilan, which is one of the most fertile, rich, and pleasant provinces in all Persia. It is large and populous, but hath not the least fortification. The streets are agreeable and planted with trees; but the houses in general are meaner than those of any other city in the empire; they are all covered with tiles, or slates. The market place is capacious, and contains many good shops; and all the necessaries of life are exceedingly cheap.

The city of Derbent is situated in 41 deg. 15 min. north latitude, and in 51 deg. east longitude: it is about three miles in length, and near five hundred paces in breadth; the castle and wall are five feet thick, and it is supposed they were built by Alexander the Great. They appear to be built with freestone, but in reality are a composition of pounded muscle shells, and pieces of free-stone beaten to powder, which being moulded into the form of bricks, are so excellently cemented together, that the whole composition is now harder than any marble; a garrison of five hundred soldiers is kept here.

Schiras, which lies about two hundred miles to the southward of Isfahan, is a place of considerable trade. The wines made here are the best in Persia; the fruits and flowers are incomparable, and the surrounding country is a perfect paradise; but only about four thousand of the houses are at present inhabited: it is the capital of Pars, the ancient Persia; and its college for the study of oriental literature, is one of the best in Persia. Though the streets are narrow, the buildings in general are superb and elegant, and the mosques are innumerable.

The cities of Ormus and Gombroon, on the Persian Gulph, are much on the decline at present, though they were formerly places of great commercial consequence. Most of the European nations, particularly the English, have established factories at Gombroon, by the means of which they carry on a trade with the Persians, Turks, Tartars, Arabians, Armenians, Banyans, &c. Of these factories a more particular account will be given hereafter.

SECTION II.

The Natural History of Persia.

THE most singular circumstance in the natural history of Persia, is what relates to the springs of Naptha.

The dark grey or black naptha is principally found in the little island Wetoy. The springs ferment and boil highest when the weather is thick and hazy. It often takes fire at the surface, forms a flaming rivulet, and rolls with great rapidity to the sea, which it enters and retains its flames till it gets to an astonishing distance from the shore. In fine weather the springs boil up to about three feet, in doing which it often hardens till it almost closes the mouth of the spring, and sometimes quite covers it up, and forms a hillock upon it. But a spring is no sooner opposed and obstructed in one place, than it works its way under ground, to another, where it breaks out with redoubled violence. The mouths of the springs are about ten feet in diameter, or more when they have continued long open. The poor people use the naptha as oil in their lamps, and often to boil their provisions, but it gives the food a disagreeable taste, and is indeed in itself very disgusting to the smell. This occasions the island not to be inhabited, at any time, except when the people are gathering naptha.

When althes are mixed with the naptha, it burns best in the lamps; it is kept in earthen vessels under ground, at a distance from any dwelling place, as it is very apt to take fire, and when such an accident happens, it is as dangerous as gunpowder.

There is a thin white naptha found in the peninsula of Apcheron, which is drank by the Russians as a cordial, and used externally as a medicine. It is purchased by the Indian merchants, and being properly prepared, forms the most beautiful and durable varnish in the universe.

Near the city of Baku on the Caspian sea, mines of brimstone are found.

The temple of the Gebers, or Gours, who are the worshippers of fire, is about ten miles from Baku. The earth for two miles round hath been long famous for its singular qualities, for on passing off the surface of the earth in any part of that extent, to the depth of two or three inches, and touching the uncovered part with a red hot coal, it immediately takes fire. Though the flame makes the soil hot, it does not consume it, or injure any thing near it. If a hollow cane, or any other tube, though made of the slightest materials, be put a few inches into the ground, and the top of it be touched with fire, a flame will instantly burst out, which will burn exceedingly clear, without consuming the cane or tube. Thus the inhabitants of these parts kindle a fire and dress their food without expence; for their houses consist only of a ground floor, which is not paved, so that when they want to dress any food, they run three or four canes into the ground, and having kindled a fire, they put on their pot. The flame may be extinguished in the same manner as spirits of wine are. This flame smells sulphureously like naptha, but is not quite so offensive, and the more strong the ground, the more strong and clear is the flame.

In Persia we see a fine country miserably neglected, where nature has done much, and art little; where cultivation is only subservient to absolute necessity, and any improvement in agriculture is never once thought of.

Towards Tartary, and on the borders of the Caspian sea, the soil itself is rather unfruitful, but to the southward of Mount Taurus the natural fertility of the ground is astonishing; the corn, which is brought to perfection with a very little trouble, is admirable. They make excellent wine of grapes, which are the spontaneous productions of those parts. The other fruits are delicious, and the face of the country teems with all the luxuries of life.

No part of the world produces better oil or finer drugs; particularlyenna and rhubarb. The cucumbers, dates, orange, pistachio nuts, melons, and all kinds of what Europeans call garden vegetables, are not to be excelled.

It is to be observed that what hath been said relates to the open country only, for no people in the universe are more careful of their gardens than the Persians; like the Chinese, they deem gardening one of the most important sciences, and spare neither pains nor expence to render their enclosed grounds beautiful, as well as useful, as a description of their gardens will evince.

The Persians do not introduce flowers into their gar-
P den

dens as the Europeans do; these are the spontaneous productions of the fields; but the gardens are filled with plantations of the most excellent fruit trees. Their walks are curiously laid out, and set on both sides with trimmar trees, a species of poplar not known in Europe; it grows to the height of a pine, bears a fruit resembling the chestnut, and has broad leaves like those of the vine. Of the wood the Persians make their doors and window shutters, as it is brown, smooth, finely veined, and much more beautiful than the finest walnut tree. But these people plume themselves on their skill in hydraulics, in which they seem to excel, and their fountains are deemed the finest ornaments of their gardens.

The Emperor's garden near the city of Ispahan, called Fynback, is exceedingly fine; it is exactly square, being half a league each way; it is divided at right angles by the river Senderuth. Towards the south there is a mount finely planted with trees, which form several beautiful walks; on each side are precipices, made by cutting the rock, and from the top several streams of water fall into basins at the bottom, and form a variety of artificial cascades. There are basins and fountains in every walk, but they all differ from each other in appearance, and spout out the water variously.

In the middle of the garden there is a very large basin, into which all the several streams disembogue themselves, and from which a column of water is thrown up to the height of 40 feet. The basin is square, and at each corner there is a large pavilion, containing several fine apartments, adorned with beautiful carving and gilding. This garden is not only planted with all the species of fruit-trees in Persia, but with many from Turkey and India, which were procured at a great expence for that purpose, by Shah Abbas; among which is a peculiar kind of vine, the grapes whereof are as large as a walnut; they contain no stone, and taste most deliciously. There are 110 gardeners to take care of this garden; that is, 10 master gardeners, and 10 others under each of them. They are suffered to let any person see the garden for 4 kaibekies, or two-pence a piece; who are allowed to eat what fruit they please, but to carry none away.

In most gardens there are summer-houses, containing four apartments, suitable to the four winds, where the master may take the benefit of the air as he pleases; and it frequently happens that these summer-houses are far superior to the dwelling houses, both with respect to the architecture and furniture.

In Persia the number of mulberry-trees is so prodigious, that it enables the natives to feed innumerable quantities of silk worms, which produce some of the most excellent silk in the universe.

All the flowers that are known in Europe are found in the Persian fields, with many others, peculiar only to that country. For many miles round Ispahan the ground is enamelled, and the air perfumed by them.

The flowers in general are thought to be more beautiful in colour, and more pleasing in their odours than those of most other countries.

Here are a great number of wild chestnut, turpentine, and almond trees. Many provinces produce trees which bear those gall nuts which are used in dying. There are gum, mastic, and incense trees; the latter, which are found in Carmania, resemble the pear tree. The plantain trees are supposed to prevent the plague from visiting places, where they are found in abundance; and it is asserted by the Persians, that at Ispahan, where the plague was formerly frequent, no contagion hath happened since the gardens and public walks of that city were planted with these trees.

Willow, fir, and cornel trees abound. The manna trees are of various sorts; the best yellow is found in Nichapour and part of Bactria.

They have plenty of tobacco about Hamadan and Sufa, and the Persian poppy is deemed the finest in the universe. The roots and salading are better tasted, and less liable to create ructions in the stomach, than those of any other country.

In Chorassan they have rhubarb, which is in high estimation, though it must be confessed that it is inferior to that brought from Tartary. Here is plenty of

scna, nux-vomica, cassia, gum-ammoniac, assafetida, &c. Affetida is common in all the oriental countries, being used in ragouts, sauces, soups, &c. it is allowed to have the strongest odour of any thing in the universe; whatever vessel it is put in, it always retains the smell, and all the goods in any ship in which assafetida is packed up, are more or less impregnated with the scent.

In Persia there are two kinds of mummy, the one is a natural production which distills from a rock, the other is taken from embalmed bodies. It is an admirable medicine in the cure of wounds, bruises, &c.

Galbanum and the cotton tree are very common, but there is another tree which produces a very fine cotton, or rather a silk.

The melons, of which there are above twenty different sorts, are perfectly delicious and exceedingly wholesome.

All the fruits of Europe are found in great perfection in Persia, particularly peaches, apricots, and nectarines, some of which weigh eighteen or twenty ounces.

The pomegranates, apples, and pears, which grow in Iberia, are very fine, as are the dates of Carmania, the oranges of Hyrcania, and the onions of Bactria; the last mentioned are as sweet as apples. The wheat, barley, rye and oats, are exceeding good, and the rice is universally admired.

The Persians know nothing of grafting, but many of their rose bushes bear three sorts of roses naturally. Salt, sulphur, alum, and salt-petre are here produced by spontaneous nature. There are large quarries of black, white, red and mixed marble.

The horses are the most beautiful of the East, though not deemed to be so swift as the Arabian. The asses are of two sorts; first, the native asses, which are dull, heavy, and stupid; and secondly, the Arabian breed, which are beautiful and docile, and are in high estimation for the saddle.

There are three sorts of camels, viz. the small the large, and the swift; the swift can trot as fast as a horse can gallop: the large can carry 1200 or 1300 wt. they are not beaten, but managed by the voice, the driver fingering a kind of song, and the camel proceeding faster or slower according to the modulation of the voice.

Oxen are used in ploughing; but beef is seldom or ever eaten. Hogs are scarce; sheep and deer plenty; and wild beasts, such as lions, leopards, bears, tigers, &c. very numerous, particularly in Hyrcania. The jackals dig graves, and tear up the dead bodies, being exceedingly fond of the flesh.

There are abundance of locusts, or flying grasshoppers; and many black serpents, whose sting proves mortal in a few hours: many provinces produce a frightful kind of lizard, which is above a yard in length.

Persia produces all the different kinds of fowls, which are found in Europe, but not in abundance; but wild and tame pigeons are very plentiful: for it is imagined that no country in the universe contains so many pigeon houses, there being above 3000 in Ispahan and its neighbourhood. The reason of such a number of pigeons being kept is on account of their dung, which the Persians deem the best manure for their melons, of which they are so fond.

Martlets and the nours are taught to speak like parrots. The nightingale is heard all the year round, though it sings finest in the spring; but the principal bird is the pelican, which has a beak near twenty inches in length, a head too large in proportion to the body, and feathers as soft and white as those of a goose. It usually rests its long beak upon its back; its food is fish, in the catching of which it shews great dexterity.

There are a great number of birds of prey, which are taught to fly at other game, the Persians being great lovers of falconry.

Fresh water fish are not plenty on account of the great scarcity of rivers: but they have sea fish in great abundance.

In Carmania there is a natural rarity called the wind-poisoning-flower, which it is said infects the air. There is another shrub called assos poison, because those animals are fond of eating it when they can find it, though it is sure to prove mortal to them.

noniac, affluetida, oriental countries, &c. it is allowed in the univérse; it retains the smell, which affluetida is cured with the scent, namely, the one is a in a rock, the other is an admirable me- ses, &c.

EMPIRE OF PERSIA.

59

The bezoar stone is taken from goats, both wild and tame, which feed near the Persian gulph. It excels the bezoar of Golconda, because the herbage upon which the goats feed is the dryest in the univérse. This stone, which is used in medicine as a sudorific, is now greatly sunk in its reputation in the Oriental regions.

It is happy for Persia, which is so much troubled with the Lind locust, that there are great swarms of abnelees, or water locusts, which are natural enemies, and devour the others wherever they meet with them. They are of the size of an ordinary hen; the feathers are black, the flesh greyish, and the wings large.

At some distance from Ispahan, the Persian metropolis, is Mahmoudker, or Mahmoud the Deaf, a river so called, which falls into an extensive and beautiful basin, through a range of rocks, which nature hath formed into a kind of fortification, with regular battions, embrasures, &c. through which the winds pass with astonishing velocity. As the traveller ascends the mountain, he is entertained with a view of the river through a variety of chinks. It appears like a lake covered with rocks and mountains: stones, when thrown in, make a surprising noise; and the river itself is deemed unfathomable.

S E C T. III.

A succinct and concise History of Persia.

THERE is not, perhaps, in the univérse a country whose history is more replete with great and singular events than that of Persia. It hath exercised the pens of the most eminent writers, both sacred and profane; and forms a principal part of the history of the chief nations in the earliest ages of the world.

Persia constituted a part of the first great monarchy in the univérse, supposed to have been founded by Nimrod, or his son Belus, the Baal of the ancient idolatrous nations. Most of the particulars relative to Semiramis, and her son Ninus, are so exceedingly fabulous, that they are not worth repeating. Indeed the Persian history is very little to be depended upon till A. M. 2083, when Abram fought a battle with four Persian princes, and defeated them with only 318 of his own family. These princes were Chedorlaomer, king of Elam or ancient Persia, Arioch king of Ellasar, Amraphel king of Shinar, and Tidal king of Nations, a successor of Nimrod.

The history of the Assyrian empire, from the time of Nimrod to the reign of Sardanapalus, is exceedingly vague, uncertain, and mutilated.

Sardanapalus, who flourished about the year of the world 3237, was timid, luxurious and effeminate. He painted and dressed like a woman; was fond of none but female amusements, and passed all his time in his seraglio: he was a great drunkard and glutton, and extremely solicitous after riches, not for the sake of hoarding them up, so much as to have an opportunity of spending them in rioting.

The following two lines were engraved upon his tomb by his own peculiar order:

*Hæc habeo quæ edi, quæque exaturota libido
Hæc fuit: at illa jacent multa & præclara reliqua.*

Which may be thus rendered into English:

All I've enjoy'd, or eat, away I take,
What I can't reach, I leave for others sake,

which shew the natural fordidness of his soul.

Arbaces, the governor of Media, contrived to be introduced into the palace of Sardanapalus privately, where he beheld the scandalous manner in which he lived, and found that a potent sovereign, whom many warlike nations obeyed, had, by his luxurious and inactive manner of life, rendered himself more effeminate than a woman. Arbaces therefore determined to dethrone him, and being joined by others, found himself at the head of a powerful army. Sardanapalus at first hid himself in his palace, but being persuaded by some of his nobles to put himself at the head of his army, he did, but was defeated and pursued to Ninevah; finding that he could not maintain that city against the revolvers, he ordered a vast pile of wood to be raised, and upon it burnt his

treasures, his eunuchs, his women, and himself. After the death of this emperor, the revolvers divided his dominions; thus Arbaces took Media and Persia; Belochus assumed the government of Babylonia and Chaldea; Ninus the second reigned in Ninevah and the circumjacent countries, and the rest of the conspirators usurped the other provinces, which had helped to constitute the empire.

Belochus, Belshis, Nabonassar, or Baladan, as he is termed in the scripture, reigned 12 years, beginning his reign A. M. 3257, which is the celebrated era of Nabonassar.

He was succeeded by his son Merodach Balladan, who was followed by several other kings of Babylon, to whose histories we are totally strangers, as nothing concerning them hath been transmitted to posterity but what is evidently fabulous.

The city of Ninevah, where Ninus the Second, or Tiglath Pileser reigned, was at this time nineteen miles in length, and about eleven in breadth, and the circumference sixty miles. It is of the circumference that the Prophet Jonah speaks, when he says in the Eastern stile, that it was a city of three days journey. Three chariots might go a-breast upon the walls, which were one hundred feet in height; the towers or castles by which it was fortified, were two hundred feet in height, and one thousand five hundred in number. Ninus conquered Syria, and annexed not only that kingdom, but all Israel beyond Jordan or Galilee, to his own dominions.

Hofea, king of Samaria, being desirous of shaking off the Assyrian yoke, courted the alliance of So or Sabachus, the Ethiopian monarch, who had conquered Egypt. To punish the presumption of Hofea, Salmanassar, king of Ninevah, marched against him with a powerful army, plundered and laid waste the country, loaded Hofea with chains, imprisoned him during the remainder of his life, and carried away his subjects the children of Israel, into captivity.

Salmanassar having reigned fourteen years, was succeeded by his son Sennacherib, or Sargon, as he is termed in scripture. King Hezekiah having refused to pay the usual tribute, Sennacherib invaded Judea, and obliged Hezekiah to give him not only his own treasures, but also those belonging to the Temple. After receiving every thing he could ask, he refused to withdraw his army agreeable to his oaths and promises, but carried on the war, and reduced the whole country, except Jerusalem, which he closely invested. At this crisis he was informed that the kings of Ethiopia and Egypt were marching to the succour of Hezekiah; he immediately raised the siege to oppose them, but first wrote a letter to the king of Judea, replete with the most horrid blasphemies. Having defeated the armies of the Ethiopians and Egyptians, he returned to the siege of Jerusalem, where the vengeance of Heaven overtook him, for in one night 185,000 of his men were destroyed by the sword of an angel, and he was compelled to retreat with the wretched remains of his forces. Thus the proudest monarch upon earth, who styled himself king of kings, and victor of nations, was in a few hours brought from the highest pinnacle of glory, to shame, confusion, and distress.

Sennacherib's disappointments rendered him so tyrannical, savage, and cruel, that he even became odious to his own relations, and was at length murdered by two of his own sons, in his principal temple, while he was prostrating himself before an idol named Nisroch. The parricides fled to Armenia, and their younger brother Esarhaddon mounted the throne. The royal family of Babylon becoming extinct about this time, Esarhaddon turned the distracted state of that kingdom to his own advantage, and annexed it to his dominions, reigning over the united kingdoms thirteen years: previous to his death, he likewise conquered Syria, Palestine, and Israel, and added them to the Assyrian empire. His whole reign was exceedingly prosperous, and lasted thirty nine years. He was succeeded by his son Sardanapalus, or Nebuchadnezzar the first, who ascended the throne A. M. 3335.

Saracus his son reigned after him. A general rebellion to this monarch raised a rebellion against him, made himself

himself master of Babylon, reigned there twenty one years, and then having entered into a treaty with Cyaxares, king of Media, they, in conjunction, laid siege to Ninevah, took it by storm, and entirely destroyed it. Sardanapalus being slain in the siege, the successful general Nabopolassar, transferred the seat of the Assyrian empire to Babylon, and was acknowledged as sovereign by all ranks of people.

The neighbouring monarchs, alarmed at the growing power, and envious of the rising greatness of Nabopolassar, united their forces against him and his colleague Cyaxares, recovered Syria and Palestine, and advanced as far as the Euphrates.

Nabopolassar being grown old, sent his son Nebuchadnezzar at the head of a powerful army against them, who defeated the confederate armies, retook the city of Carchemish, and recovered Syria and Palestine.

He then penetrated into Judea, laid siege to Jerusalem, and took it in the year of the world 3398.

He put Jehoiakim, king of Judea into irons, designing to carry him to Babylon in order to grace his triumph. But being at length moved to compassion by the severity of that king's affliction, he relented, and restored him again to his throne; he, however, carried a great number of Jews with him into captivity, particularly several of the royal family, plundered the king's treasury, and even the temple, from whence he removed the most valuable vessels. From this era we are to date the Jewish captivity at Babylon, which happened in the fourth year of Jehoiakim king of Judea; among the rest Daniel the prophet being then only eighteen years of age was carried into captivity, as was Ezekiel a short time after.

Nabopolassar dying A. M. 3399, his son Nebuchadnezzar, who, for some time, had shared the government with him, now ascended the throne of Babylon, by the name and title of Nebuchadnezzar the second.

His dominions included Chaldea, Assyria, part of Arabia, Palestine and Syria, over which he reigned 43 years.

He had a dream in the fourth year of his reign, which greatly oppressed his spirits, though he could not recollect the particulars of it.

The soothsayers, diviners, and magicians of the empire were accordingly called together. When they were assembled, Nebuchadnezzar demanded of them the particular circumstances of the dream.

They replied, that it exceeded their skill to tell what any person had dreamed, their art extending only to the interpretation of those dreams which were told them. This so greatly enraged the king, that he ordered all the magicians and wise men to be put to death. In this bloody order, Daniel and three of his companions were included, they being deemed to possess all the learning and skill of the Egyptians and Arabians. Daniel however desired to have an audience of the king, when being admitted into his presence, he, to the king's great astonishment, told him the substance of his dream. The king being now convinced that the God of Israel was the true God, advanced Daniel to the highest offices of the state, his three friends were likewise promoted to great trust and dignity.

About this time the king of Judea revolted, but was killed in an engagement with the troops of Babylon, under the command of one of Nebuchadnezzar's generals. Jeconiah his son was shut up and closely besieged in Jerusalem by the Assyrian army till the arrival of Nebuchadnezzar, who soon made himself master of, and plundered the city, sending away every valuable to Babylon.

He placed his own uncle Zedekiah upon the throne, and carried Jeconiah, his wives, officers, and even his mother, into captivity, exclusive of a vast multitude of the common people.

Zedekiah, however, soon revolted, and Nebuchadnezzar again laid siege to Jerusalem, which after having been invested above a twelvemonth, was taken by storm. Zedekiah was carried to Babylon into captivity, after having had his eyes put out; but his two sons, his nobles, and all his principal officers of state, were put to the sword; the fortifications of Jerusalem were demolished, the city burnt, and the temple destroyed.

Nebuchadnezzar was now so elated with pride, that he ordered a statue of gold to be made, of sixty feet in height.

The idol being completed, he convened together all the principal people of his empire, in order to dedicate it with the utmost solemnity, and published a decree that all should be thrown into a fiery furnace, who refused to acknowledge it as a deity, and to pay it adoration.

Three Hebrew youths, however, named Ananias, Misael, and Azarias, or as they are termed in scripture, Shadrach, Meshach and Abednego, absolutely refused to comply with the royal mandate. Being, therefore, in consequence of the king's order, thrown into the fiery furnace, they were miraculously preserved from the flames by the intervention of heaven. This so affected the king that he published another ordinance, enjoining, upon pain of death, that nothing should be said against the God of the Hebrews.

Nebuchadnezzar then laid siege to Tyre, but was thirteen years before he took it. The principal Tyrians, however, escaped in their vessels to a neighbouring island, where they erected another city, which soon surpassed the former in magnificence and wealth. After the conquest of Tyre he subdued Egypt, and having attained the pinnacle of glory, he determined to complete the buildings and embellishments of Babylon.

Nebuchadnezzar now fell a sacrifice to his own pride, and by pretending to be equal to God became inferior to man; for the Almighty deprived him of his senses; he was excluded from the society of men; grazed in the fields like the oxen; had nails like the claws of birds; and hairs like the feathers of eagles.

In seven years time, however, his senses were restored to him, he reassumed the government, and being sensible of the enormity of human vanity, and of the immense power of the Almighty, he published an edict against idolatry, and died the ensuing year.

He was succeeded by his son Evil Merodoch, who immediately released Jeconiah from the prison where he had been confined thirty-seven years. He was, however, of so vicious a nature, that his own relations conspired to put him to death, when his sister's husband, Nezig-lestar, who was one of the conspirators, mounted the throne.

In the year of the world 3444, he entered into an alliance with the Lydians against the Medes, when Cyaxares, king of Media, called in the assistance of the Persians; but before the war began the king of Babylon died; and his son Labarodoch, one of the most infamous monarchs that ever existed, reigned but nine months, being put to death by his own subjects, on account of his excessive wickedness.

He was succeeded by a son of Evil Merodoch, named Labynit, or as the scripture terms him Belshazzar, A. M. 3449.

In this reign Babylon was taken by Cyaxares, king of Media, and Cyrus, king of Persia, and an end put to the Babylonish empire after a duration of 210 years. The succeeding Persian kings not only destroyed a great part of Babylon, but chose their residence at Persepolis, Shushan, Ecbatana, &c. in order that it might fall to decay as soon as possible, by ceasing to be a royal seat.

Cyrus and Cyaxares reigned jointly over the dominions of those they had subdued for the space of two years, when Cyaxares dying, Cyrus became sole monarch of Media and Persia by birth, and of the Assyrian empire by conquest; and the whole acquired the name of the PERSIAN EMPIRE, of which he was deemed the first founder. Cyrus divided the whole of his dominions into one hundred and twenty provinces, each of which had its governor, who was obliged to give an account of his administration to three great officers of state, of which Daniel the prophet was principal. The seventieth year of the Babylonish captivity expired in the first year of Cyrus, when he published an ordinance by the persuasion of Daniel, permitting the Jews to return to Jerusalem, restoring at the same time the vessels which Nebuchadnezzar had plundered from the temple.

Peace being formally established throughout the empire, Cyrus made it his practice to reside yearly seven months

lated with pride, that made, of sixty feet in

months at Babylon, three at Susa, and two at Tauris. After a reign of infinite glory, he died in the seventieth year of his age; the seventh after his reigning sole monarch of the Persian Empire, the ninth after the cap- tion of Babylon, and the thirtieth after his being ap- pointed to the command of the Persian forces. His eldest son Cambyzes succeeded him on the throne, though he left several provinces to his younger son Tanaoxares.

Cambyzes, in A. M. 3479, invaded Egypt, and made himself master of Pelusium, or Damietta, as it is at present called, by a singular stratagem; for he drove a great number of those animals which the Egyptians adored, before the van of his army; these were oxen, cats, &c. The Egyptians perceiving such a number of those animals whom they venerated, would not shoot a single arrow lest they should wound a god.

Amasis died during the war, and his son Psamaticus ventured a general battle with the Persians, but was de- feated and made prisoner. Cambyzes, however, treated him with great humanity, and restored him to his throne, but Psamaticus afterwards revolted, which so enraged the Persian monarch, that he put him to death.

A. M. 3480, Cambyzes invaded Ethiopia, in which expedition he lost a great part of his army by a variety of accidents, and was at length compelled to re- tire. He was so chagrined at his disappointment, that on his return through Egypt, he destroyed the city of Thebes out of mere vexation. To add to his affliction, he received intelligence, that an army which he had sent to invade Lybia, was destroyed by a hurricane of sands in the deserts, which was so terrible, that it had over- whelmed and suffocated all his troops. This news ren- dered him almost frantic; when arriving at Memphis, during the paroxysm of his rage, he found the people celebrating a certain festival. This appearance of mirth redoubled his fury, for he fancied that they were re- joicing at his ill success; giving way therefore to the dictates of his anger, he wounded the sacred ox with his sword, and ordered all the priests to be instantly put to death. In fact, his misfortunes had so far impaired his understanding, and soured his temper, that he ex- ercised the utmost cruelties even upon his nearest re- lations and best friends.

In passing through Syria towards Babylon, he received advice, that his brother Smerdis had usurped his throne. Cambyzes, however, well knew, that Smerdis was ac- tually dead, and that this must be some impostor, who pretended to be his deceased brother in order to impose upon the people; he therefore determined to hasten his march towards Babylon, to undeceive his deluded subjects; but, in mounting his horse, he by acci- dent wounded himself with his own sword in the thigh, of which wound he speedily died, A. M. 3482.

The usurper Smerdis, who greatly resembled the real Smerdis in person, features, and age, was the son of the governor of Babylon, who was one of the magi.

The people were easily imposed upon, and recognized him as their king upon the death of Cambyzes.

As soon as he was seated upon the throne, he seques- tered himself as much as possible from the people, and particularly concealed himself from the nobles. This mysterious conduct occasioned the principal people to surmise, that he really was not the prince he pretended to be.

A Persian nobleman, whose daughter was one of the usurper's concubines, gave her orders to observe if Smerdis had any ears. She assured him he had not; for Cyrus had ordered his ears to be cut off, for some offence he had committed against him during his reign.

This discovery being made known, a number of the nobility entered the palace, and having put him to death, cut off his head, and exposed it to the people, who were so exasperated at the magi for assisting in the imposition, that they murdered the greatest part of them, and instituted a festival in commemoration of the event.

Darius Hystaspes, who was the person that gave the usurper his mortal wound, was unanimously chosen em- peror A. M. 3483; he immediately married Atossa, the widow of Cambyzes, and Ariston, another daughter of Cyrus; he had many other wives, who brought him a numerous issue.

It was this monarch who was the Ahasuerus of the sacred writings, and at the request of queen Esther caused the celebrated edict against Haman, and in favour of the Jews, to be published.

Darius removed the regal seat to Susa, when some in- terested persons taking the advantage of his absence from Babylon, persuaded the people to revolt.

Darius accordingly marched against Babylon, and be- sieged it for eighteen months, without being able to take it; when one of his generals, named Zopyrus, pre- tended to desert to the enemy, and by means of an art- ful tale, contrived to insinuate himself so far into the good graces of the Babylonians, that they were weak enough to entrust him with the command of their forces. This power he soon used in favour of Daries, to whom he betrayed the city. The Persian monarch ordered the walls to be demolished, and put to death a great number of citizens, who had been most active in the revolt.

He afterwards made two unsuccessful expeditions, the one into Scythia, and the other into India; and in the year of the world 3514, he invaded Greece; but Milti- ades, the Athenian general, gained a complete victory over the Persian army at the pass of Marathon; though the Persian emperor had ten times the number of men under his command.

Darius then made preparations to invade Egypt, which had revolted, but dying before his army was completed, his son Xerxes succeeded him, in the year of the world 3519. Xerxes determined to pursue his late father's measures vigorously; he accordingly marched into Egypt, and subdued that kingdom.

Three years afterwards he invaded Greece, with a considerable army, consisting of near 3,000,000 of men. The Carthaginians at the same time had engaged to invade the Grecian territories in Sicily and Italy by sea. Xerxes laid a bridge of boats over the Hellespont, that his vast army might pass with the greater facility; but a storm destroying the bridge, the Grecian writers pretend that he ordered the waves to be battinaded, and settlers to be thrown into the sea, to let the waters know that he was their master. Having caused a stronger bridge to be made, the army secretly passed over it; however, he was unsuccessful in his expedition, no part of Greece, except Thrace, submitting to his arms; and Leonidas, a Spartan prince, disputed his passage so bravely at the pass of Thermopylae, between Sicily and Phocis, that 20,000 Persians were slain in various assaults, though Leonidas had only 4000 men under his command.

At length a treacherous native shewed the Persians a way up the mountain which commanded the Strait. Leonidas perceiving this, judged it would be impossible to defend the pass, and therefore determined to die upon the spot: he accordingly dismissed all his troops, except three hundred, who chose to share his fate. Before the attack began he invited them to dine with him, telling them at the same time, that they must sup with Pluto. The attack was then begun; Leonidas and his Spartans sold their lives at a dear rate, all being killed except one, who escaped and carried the news to Sparta, where he was punished for cowardice, in not staying and dying with his companions. This action, however it may have been admired, appears to have bordered more upon rashness than real courage, and to have been founded rather upon absurdity than true heroism.

On the same day that the above action happened, the Grecian fleet, consisting of 400 sail, defeated the fleet of the Persians, which consisted of full one thousand ships.

Xerxes, however, proceeded to Athens, when the Athenians sent their wives and children to Peloponnesus, abandoned their city, and retired to their shipping. Xerxes entered Athens, which he first plundered, and then burnt. The Grecians, however, obtained another signal victory over his fleet at Salamis; and a report at the same time prevailing that they intended to cut off his retreat by destroying the bridge over the Hellespont, he therefore halted back, and found the bridge destroyed, not by his enemies, but by a storm. He, however, con- trived to pass with part of his army, leaving 300,000 men behind to continue the war, who were defeated the

ensuing campaign by Aristides and Paufanias, and their general Mardonius was slain. In these various expeditions Xerxes had above two thirds of his vast army destroyed, and was so chagrined by his repeated disappointments, that he burnt all the Grecian temples in Asia, the temple of Diana at Ephesus excepted.

Soon after Mithridates, an eunuch, and Artabanus, a captain of the Persian guards, formed a conspiracy, and murdered this unhappy monarch, who was succeeded (A. M. 3532) by his third son Artaxerxes, the two elder having been destroyed by the above mentioned regicides, whom Artaxerxes put to death soon after his ascending the throne.

This monarch subdued Egypt, which had revolted, and assisted the Jews in rebuilding the walls of Jerusalem. The Grecians, however, continued the war, and carried it into Asia with success, when Artaxerxes thought proper to conclude a peace with them; and thus terminated a war which had raged for the space of fifty years.

Artaxerxes died in the 49th year of his reign. His sons, who were numerous, disputed each their title to the throne; at length Ochus, or Darius, prevailed; but dying soon, he was succeeded by his son Ariaces, (A. M. 3600.) who ruled the whole empire, except Lesser Asia, which was bequeathed to a younger brother.

Ariaces was born before his father was king, but his brother Cyrus after: the younger prince, therefore, imagined that he had the greatest right to the whole empire. To support this claim, he raised a numerous army of Persians in his government of Lesser Asia, and having procured the assistance of a body of auxiliary Grecians, he began his march to dispossess his brother of his crown.

Ariaces met him with an army of 1,000,000 of Persians, at the distance of about seventy miles from Babylon, when the army of Cyrus was defeated, and himself slain. The Grecian auxiliaries, however, made an admirable retreat, under the conduct of their able and learned general, Xenophon, whose narrative of that celebrated transaction is one of the finest pieces of ancient history that the moderns are acquainted with.

Ariaces was succeeded by his son Ochus, A. M. 3642. This prince subdued the Egyptians and Phoenicians, who had revolted, destroyed all the fortified places and temples, and carried many of the people into captivity. Among the rest was an Egyptian eunuch, called Bagoas, of whom Ochus soon grew exceedingly fond, and heaped innumerable favours on him. This, however, did not prevent Bagoas from conspiring against him, and poisoning him in the 23d year of his reign. Not content with this treachery, he in a very short time poisoned his son Ochus, who succeeded him, and contrived to place another Ochus upon the throne, who, it is imagined, was not in the least related to the royal family. It was not, however, long before he was displeased with this monarch also, and, as usual, had prepared a cup of poison for him; but the king discovered his intentions, and obliged him to drink the poison himself. Thus was his repeated treachery punished, and the law of retaliation properly exercised.

Ochus then assumed the name of Darius Codomanus, and (A. M. 3668) was invaded by the Grecians under the conduct of Phillip king of Macedon, who was chosen generalissimo of the confederate armies of Greece; but being murdered, his son Alexander, afterwards known by the name of Alexander the Great, succeeded him.

This prince being only twenty years of age, passed the Hellespont at the head of 30,000 foot and 5,000 horse, and defeated Darius on the banks of the Granicus, though his army consisted of 100,000 Persians and 10,000 auxiliary Greeks: when Sardis and many other cities submitted to the conqueror.

During the ensuing winter, Alexander visited the temple of Gordian, where he cut with his sword the celebrated Gordian knot, which so many had in vain attempted to untie, on account of the tradition, that whoever could untie it should conquer Asia. As soon as the season permitted, Alexander marched to the R.aits of Iliss in Cilicia, when Darius very imprudently

attacked him at a time the situation of his army was admirable. The Persians were again defeated, and Darius's mother, wife, several of his children, and 300 of his concubines, were taken prisoners. All the cities of Palestine and Phenicia now submitted to the conqueror, except Tyre, which sustained a long siege; but being at length taken by storm, all the inhabitants were put to the sword, except two thousand who were reserved for crucifixion; which cruel sentence they afterwards suffered upon crosses erected for that purpose along the sea coast, for no other reason than having bravely defended their lives and properties, and performed the parts of worthy citizens and heroic soldiers. This detestable affair will be a lasting stigma upon the character of Alexander, and blast his laurels with infamy: Syria and Egypt submitted to the conqueror. Alexander now visited the temple of Jupiter Ammon, whose son he pretended to be. After having built the city of Alexandria, he penetrated into Palestine, passed the Euphrates and Tigris, and in the plains of Arbela again gave the Persians a total defeat; the consequence of which was, Babylon, Susa, and Persepolis, opened their gates to the conqueror; the latter of these, which was then the finest city in the universe, he burnt at the instigation of Thais, a Grecian courtesan.

Alexander then continued to pursue Darius; but that unhappy prince was murdered by one of his own generals named Bessus, whom Alexander afterwards put to death for his treachery. Thus ended the Persian monarchy after a continuance of 209 years.

Alexander then carried his arms into India, subdued Porus, a powerful monarch of that country, and indeed conquered the greatest part of the then known world. He afterwards married Statira, the eldest daughter of the unfortunate Darius; and at the same time obliged his officers to intermarry with Persian ladies. Returning to Babylon, elated by vanity, and intoxicated by success, he gave himself up to all manner of debaucherie, and at length fell a martyr to excess, A. M. 3681.

As Alexander had not named a successor, his generals shared his dominions among them. To Ptolemy fell Egypt; Seleucus, the son of Antiochus, possessed Babylonia, and Syria; and Cassander reigned in Greece.

In the year of Christ 630, the Saracens, who succeeded Mahomet, made a conquest of Persia. The Turks conquered it in the year 1000; and Tamerlane the Great, chan of Tartary, subdued Persia and Turkey in Asia, in the year 1400: after the race of the Tartar monarchs Sophy or Sefi obtained the regal dominion of Persia, some of the descendants of whom are at this time contending for the empire. He was succeeded by his son Shah Thamas, an inhuman prince, who was deposed by his subjects. His brother Codabundi reigned after him. This monarch was succeeded by Shah Abbas, a powerful prince, who greatly enlarged the Persian monarchy by his conquests. Having reigned gloriously for the space of forty years, he was succeeded by his grandson Shah Sefi, who was a tyrant and a drunkard. He destroyed his queen in a fit of inebriation, and at length fell a martyr to repeated excesses. After this prince, Shah Abbas the second, his son, reigned one and twenty years, but, like his father, destroyed himself with hard drinking.

He was succeeded by his son, Shah Sefi the second. The country in his reign was greatly distressed by war and famine; he died July 29, 1694. Sultan Hossien, his son, was his successor, a weak indolent prince, who, by his vices and supineness, gave great offence, not only to his own subjects, but to the neighbouring Tartar chiefs; one of whom, named Mereweis, surprised Candahor, penetrated a considerable way into Persia, determined to march to Ispahan, and even aspired to the throne of Persia itself. He died, however, before he could carry his plans into execution; but his son Mahamood, who succeeded him, pursued his measures. He made alliances with the grand signior, and great mogul, and prevailed on the Basha of Bagdad to invade the Persian frontiers, and the Russians to attack the provinces towards the Caspian sea.

The Persian court were now in the utmost consternation: Mahamood was, by hasty marches, approaching

in the utmost confter-ty marches, approach- ing

ing towards the capital, where the pusillanimous monarch offered to resign his crown in favour of his eldest son; but the son having been educated in effeminacy and never out of the seraglio in his life, was more frightened than his father, and declined either accepting the crown or commanding the army. Prince Thomas, however, a younger brother, having more spirit than the rest of the family, determined to put himself at the head of the forces, and to oppose the rebels; but when he came to take a review of the Persian troops, he found them so effeminate, undisciplined, and spiritless, that he was sensible he could not repose any trust in them. He therefore withdrew himself from the army, and retired towards the Caspian sea.

Mahamood shortly after entered Ispahan without opposition, in the month of Feb. 1721-2, and imprisoned the king and all the royal family, most of whom he afterwards destroyed. He beheaded the prime minister with most of his adherents, and seized upon the estates and properties of all who were obnoxious to him; the whole conquest being effected with only 5000 horse.

In the mean time Shah Thomas, the young sultan, assembled a body of troops, and being daily joined by a great number of royalists, he determined first of all to repel the Turks, who were ravaging the frontiers; when intelligence was brought him, that the usurper Mahamood was assassinated by one of his officers, named Efriff, who had succeeded him. Upon this information the prince gave an invitation to Kouli Khan, who had been strongly recommended to him, to join his forces.

Kouli Khan, at the head of some Ufbeck Tartars, accordingly joined the army of Shah Thomas, and marching immediately against Efriff; he defeated his troops, took him prisoner, and put him to a very cruel death. He then turned his arms against the Turks, and wrested from them all the places they had taken from the Persians during the late troubles; and afterwards compelled the Russians to evacuate those provinces, towards the Caspian sea, of which they had possessed themselves. Elated with repeated success, he aspired at the imperial dignity, and, stimulated by his ambition, he not only deposed, but murdered the unfortunate Shah Thomas; for that unhappy monarch was never heard of after his having been deprived of his throne.

As Kouli Khan's actions have been the subject of universal conversation, and the consequences of which they were productive are the most recent particulars on which we can with certainty depend, relative to the affairs of Persia, we shall be rather circumstantial in what concerns that usurper.

Among the mountains in the neighbourhood of Meshed there is a petty principality called Chalut, which is ruled by a chief who is always a native; this chief acknowledges the emperor of Persia as his sovereign; that monarch, however, has not the least real power over the abovementioned little state, but the court of Persia winks at the nominal subjection and real independence of the Chalutites, in order to preserve their friendship, otherwise they would prove very troublesome neighbours; for, secure in their mountainous retreat, they could, at pleasure, make excursions into the adjacent provinces, and plunder the Persians with impunity.

Kouli Khan, or Nadir Shah, was born at Chalut in the year 1687, and was heir to that little principality. His father died when he was only nine years old, and an uncle of Nadir's was invested with the government till he should become of age. The uncle acted with such prudence and moderation, that he became exceedingly popular, and the people unanimously confirmed to him the government during his life: for young Nadir gave such early proofs of a haughty, turbulent, and tyrannical spirit, that the Chalutites in general prefigured the most fatal consequences when he should be invested with uncontrolled power.

As this treatment was exceedingly disgusting to young Nadir, he left the place of his nativity, repaired to Chorasian, and entered into the Persian army in 1712 as a private soldier only.

His strength, courage, and military capacity, of which he gave frequent proofs, occasioned him to be promoted to the rank of colonel in 1719.

The Ufbeck Tartars having invaded Chorasian, the governor of that province thought proper to appoint Nadir to the command of the Persian troops, though by so doing he disgusted many senior officers.

Nadir's conduct tended to heighten the great opinion which the governor of Chorasian had entertained of his military talents. He acted with great courage and profound policy, and not only defeated the Ufbecs, but took many thousands of them prisoners, with all their tents, baggage, cattle, and the plunder which they had taken from the inhabitants of Chorasian.

The governor greatly caressed Nadir, loaded him with favours, and promised to recommend him so strongly to Shah Thomas, as to engage that prince to make him a general; a vacancy however falling soon after, a young nobleman related to the governor was promoted; this so exasperated Kouli Khan, that he upbraided the governor in the most insolent terms, and grew so exceedingly scurrilous, that the governor was under the necessity of ordering him to be bastinadoed.

Kouli Khan now meditated nothing but mischief; and as soon as he recovered from the effects of the chastisement, he fled to the mountains. Having put himself at the head of a band of robbers, he continually ravaged the country and plundered the caravans.

His uncle hearing of his conduct, wrote a letter to him, strenuously exhorting him to refrain from such a way of life, and that he would undertake to procure a pardon from Shah Thomas for all he had hitherto committed. Nadir assented to his uncle's proposals, and a pardon was procured. Nadir, under a pretence of returning his grateful thanks to his uncle, repaired to Chalut, with a few of his followers, where he was cordially received by that gentleman. He had previously however ordered some hundreds of his men to advance privately towards the place, and to be ready to attend to a certain signal, when they were to rush in at the only gate belonging to the fortress.

Early the ensuing morning Nadir murdered his uncle; while his followers within seized the gate with little or no resistance, and soon admitted their companions. Thus did Nadir with very little trouble become possessed of a place deemed hitherto impregnable, and which had frequently withstood the whole power of Persia; for within the perpendicular and inaccessible rocks which surround it, there is land sufficient to feed their cattle and produce all kinds of provisions for the maintenance of 12,000 men. Thus they are in no fear of a famine, and the place being accessible at only one small avenue, which is strongly fortified by art as well as nature, they are able to put all the troops in the universe at defiance. After Nadir became emperor of Persia he always deposited his treasures in Chalut, as the strongest and most secure place in his whole extensive dominions.

Being now possessed of his native patrimony, with the addition of 6000 well disciplined, bold and hardy troops, he became exceedingly formidable.

He then took it into his head to recover the city of Nechabar, which the Afghans had taken from the Persians, and succeeded by the following singular stratagem.

He sent some of his men to the mountains, who having seized a large party of straggling Afghans, they were immediately put to death. Nadir's men then having dressed themselves in the habits of the deceased Afghans, pretended to drive a great number of their companions before them, as if they had taken them prisoners. The sentinels threw open the gates to let in the supposed captives, when the Afghans were all put to the sword, and the ancient capital of Chorasian was recovered. It was after this exploit that the unhappy Shah Thomas courted his assistance, when he joined that monarch at the head of 6000 men. In the year 1728 he was appointed commander in chief of the Shah's forces, soon after which he received the title of Tachmas or Thomas Kouli Khan or Kan, the highest title the emperor could confer. He then made a very rapid progress in the recovery of the empire, as hath already been mentioned, and by carrying fire and sword wherever he came, he was at once the admiration and terror of not only the Persians but all the surrounding nations.

After

After the removal of the unfortunate Shah Thomas, Kouli Kan did not presume to mount the throne, but to have appearances had Abbas Myrza, an infant of six months old, and son of the above monarch, declared emperor. He, however, took care to keep all the power as well as the treasures of the empire in his own hands, and to fill all the great offices of state with his own creatures.

Young Abbas now being considered as emperor, Kouli Kan determined in his name to carry on the war against the Turks vigorously; but first married an aunt of the late emperor's. Then thinking of his own family, he appointed his eldest son governor of Chorasman, and his youngest governor of Herat.

The war against the Turks was successfully begun, Kouli Kan drove them all before him, and laid siege to Bagdad. However, Topal Osman, an able Turkish general, marched to the relief of it at the head of 100,000 men; Kouli Kan drew up his army, which consisted of 70,000 men, and on the 18th of July 1733 a most bloody battle ensued, and Kouli Kan, for the first time in his life, was defeated.

Kouli Kan being joined by one of his sons with a considerable army, he again marched against the Turks. The Persian army was in this engagement repulsed, and lost 4000 men; but on the 26th of October another bloody battle was fought, in which the Turks were totally defeated, losing 40,000 men, all their artillery, tents, ammunition, stores, &c. and the gallant Topal Osman was slain in the action. To the credit of Kouli Kan we must not omit to mention, that he ordered that great general to be buried with the utmost pomp and magnificence, and with all the military honours due to so great a character.

Kouli Kan now marched to Schiras, to subjugate that city, and crush a powerful rebellion which happened in those parts: this he soon effected, and spent the ensuing winter in recruiting his army, and making preparations for carrying on the war against the Turks in the following spring. For it was impossible that his enterprising spirit could ever be still; nor could his ambitious soul entertain any idea but that of war.

In the year 1734 Kouli Kan was exceedingly successful both against the Turks and the Tartars, who attempted to join them, and before the end of the year conquered all the open country of Georgia and Armenia. In 1735 Kouli Kan destroyed great part of the Turkish army at Arpa Kavi. In 1736 the young Shah Abbas died, when Kouli Kan convened the Persian chiefs and nobles, and told them that they were at liberty to choose an emperor. They therefore unanimously begged him to accept of the crown, being indeed afraid to do otherwise. Having mounted the throne, he ruled the Persians with a rod of iron, destroying many of the royal family, and putting to death all the nobility except those who were deemed idiots, or whose understanding he despised. He then seized many estates, particularly the church lands, and having concluded a peace with the Turks and Russians, he compelled the revolted Afghans to submit to his own terms; then marching into the territories of the Great Mogul, he defeated the armies of that monarch, made himself master of Delhi the capital of Hindostan, took the Great Mogul himself prisoner, put multitudes to the sword, and plundered the empire of jewels, gold, and other valuables to the amount of 87,500,000 l. sterling, a greater treasure than any other monarch in any age or nation ever before possessed.

Among other articles of immense value was the imperial throne, commonly called the peacock throne, entirely set with the finest jewels; independent of the above he took 300 elephants, 10,000 horses, as many camels, a great number of cannon, and a variety of other warlike stores.

These immense treasures he lodged in his hereditary principality of Chalat, but did not trust the guarding of them either to Turks or Persians, but to 12,000 Georgians, all of whom were Christians. He then subdued the Usshe Tartars, and brought their country to be tributary to Persia; after which he returned to Ispahan, and severely reprimanded his son for the mal-

administration of affairs during his absence. The year 1741 he spent in quelling several insurrections. In all these expeditions he committed unheard of cruelties. Among other rebels his eldest son proved one, for he attempted to murder him, but escaped till the year 1742, when he was brought as a prisoner to his father, and had his eyes put out by order of that monarch.

The cruelties that Nadir Shah now exercised both on friends and enemies, the armed and unarmed, are almost incredible, and too shocking to be recited: in short, he demolished cities and towns, laid waste fertile provinces, plundered all ranks of people, and murdered several millions of the inhabitants of Persia, and the neighbouring nations.

The Turks having in the year 1744 set up a pretender to the throne of Persia, who gave out that he was a younger son of the late emperor Shah Thomas, Nadir Shah sent one of his sons at the head of an army against him. The pretended prince was defeated, and taken prisoner. Nadir Shah being informed of this, in a temporary fit of humanity, gave orders that he might be permitted to escape, nevertheless he directed that 282 of his followers should be beheaded. In the year 1745 he again marched against the Turks and defeated them; but in 1746 and 1747, he was entirely employed in quelling domestic broils, and intestine rebellions.

Nadir Shah was now generally looked upon to be in a state of infamy. His actions were usually absurd and always unaccountable; sometimes a gleam of generosity and humanity would seem to direct his intentions, but avarice and the most horrid cruelty at most times predominated. He was, however, on the second of July 1747, assassinated by five of the principal officers of his guards. This event happened thus: The conspirators entered his tent about one o'clock in the morning, when one of them stumbling over some of the cords that fastened it, the Shah waked, started up, seized his sabre, and with one blow cut off the head of him who was next to him. He then struck the next on the left shoulder with such force that the sabre lodged in the spine or back bone, and stuck so fast that before he could withdraw it, the remaining assassins dispatched him, and cut off his head, which they took with them, and having buried their companions, they retired.

When the people heard of his death they were greatly rejoiced: they immediately put to death his blind son and his grandsons, and even all his women, lest any of them should be pregnant by him, so much did they detest the breed of this cruel and bloody tyrant, who seems to have thrown Nero and all the inhuman monsters of antiquity at a distance.

Those who have lately published geographical systems, and describe Persia as it was prior to the time of Kouli Kan, deceive their readers, and give the public no true idea of the modern state of that empire; for they do scarce mention cities which no longer exist, and describe fertile provinces which at present are desart. They talk of millions which are exterminated, and of magnificent buildings that are now levelled with the ground. All has been and still is anarchy and confusion in that unhappy country, ever since the above mentioned tyrant first mounted the throne. Several of his family, as well as others, the descendants of the family of Sefi, have been and are contending for the empire; but as their various successes, and the late revolutions are not known in Europe, at least not properly authenticated, we shall here conclude our history of Persia.

SECT. IV.

Persons, Habits, Customs, Manners, Ceremonies, Capabilities, Arts, Sciences, Learning, learned Men, Paper, Manner of Writing, Amusements, Diversions, Superstitions, Peculiarities, &c.

THE Persians in general are of a middle size, small limbed, but well made; they have usually Roman noses, black eyes, and black hair: Their complexion is tawny, and their lips thick. The men shave their heads, though many young gentlemen suffer a lock of hair to grow on each side by way of ornament, and

absence. The year

black. The men have
gentlemen suffer a
e by way of ornament,
and

and some allow their heads to reach up to their tem-
ples. The religious, however, wear long beards. All
the men, except grandees, wear caps, which are pretty
high, and gathered at the top; but those of quality
wear magnificent turbans. As they make it an universal
rule to keep their heads exceeding warm, so they never
pull off either caps or turbans even to monarchs. Their
favourite colour is red, which they admire because their
soldiers wear it, who, on that account, are called
kiefbalhee, or red heads. They wear calicoe shirts
next to the skin, that are covered by short coats or vests,
which they girt with a sash; as the vest reaches only to
the knees, a large pair of drawers supplies the place of
breeches. Cloth stockings are joined to the drawers, and
slippers with high heels are worn instead of shoes. The
materials of their clothing are, however, expensive, as
they consist of silk, furs, cotton, mulin, &c. plain, or
embroidered with gold and silver. They often wear
loose boots on their legs, and always daggers in their
sashes. The dress of the lower kind of women differs
very little from that of the men, and is rather costly;
they, however, injure what beauty they have by paint
and washes.

By the Mahometan laws the Persians are permitted
to marry four wives, and to keep as many concubines
as they please; but it is the custom of the country for
the men to consider the women as mere slaves: they
may, indeed, if they please, marry for life, or for any
determinate time.

The Persian ladies usually wear gowns of silk or
cotton, and drawers of the same, which reach to their
ankles. About their ancles and wrists they wear brace-
lets of gold, which are often set with precious stones.
They let their nails grow long, and paint them red.
The ladies are absolute prisoners, and the lower kind
of women absolute drudges, for they are obliged to till
the land, plant the rice, and do every kind of field as
well as domestic work, while their husbands go to
market, saunter about, or smoke their pipes.

The Persians use neither knives or forks, the meat
being cut into small pieces before it comes to the table,
and is soon distributed by a carver into a variety of small
dishes, or rather plates, for the company.

Their drink is mead, beer, and a kind of brandy;
but at entertainments they make a liquor called kahaveh,
which is served up in a large china vessel in the manner
of punch.

Though the common people of Persia in general
behave disrespectful to strangers, which may be, perhaps,
owing to their extreme poverty, yet the better sort are
exceeding polite and hospitable. The great number
of caravans in this country may be adduced as a
proof of the hospitality of the people. A caravan is
a large square building with a spacious court in the
middle: the building itself contains a great number
of chambers for the accommodation of travellers, and
stables for their horses. As there are not any inns in the
eastern countries, caravans are exceedingly con-
venient, though nothing but shelter is to be obtained in
them. A poor family usually resides in each to clean
the rooms and stables, and to give proper directions to
travellers.

The Persians have many rural diversions, which afford
them great pleasure: Mr. Bell, in his travels, mentions
that he saw many greyhounds and several hawks who
were trained to fly at, and pursue, antelopes thus:
the hawks fly round the head of the antelope, and
retard its velocity, till the hounds seize it; otherwise it
could not be taken, for the antelope is much swifter
than any hound in the universe. The method of train-
ing hawks to fly at antelopes is thus executed: They
fluff the skins of those animals, and feed the hawks be-
tween their horns; hence they are accustomed to fly
towards, and hover round, the heads of those animals.
The Tartars train hawks in the same manner to fly at
wolves and foxes.

The Persians are fond of swinging in a tray, fastened
by ropes fixed to four pieces of wood; but this they
are compelled to do more frequently through necessity
than for amusement; for in many provinces, during the
hot weather, the tarantula drops its venom upon the

skin, which immediately penetrates, and occasions the
most dreadful symptoms to appear; to remedy which, the
patient is obliged to drink a great quantity of new milk,
and afterwards being put into the tray, and swung about
with great vehemence, a nausea ensues, which carries
off the disorder.

In many of the principal cities and towns, but par-
ticularly Ispahan, the Persians are fond of the following
amusement: In some spacious place a pole is fixed in
the ground, on the top of which they put an apple,
a melon or a trencher, containing money; they then
ride up and down, and shoot at it on full gallop; if any
of the money falls, it belongs to the servants, and the
winner is obliged to give an entertainment to the com-
pany.

They play at cricket on foot, and likewise on horse-
back; they are fond of baiting wild beasts, encouraging
mimics, jugglers, rope dancers, &c. With respect to
hunting, hawking, and horsemanship, they equal most
nations, and exceed all at present in archery. They
throw the javelin with great dexterity, and are tolerably
expert in the use of fire arms.

The Persians, though exceedingly ceremonious, are
less so than the Chinese, but infinitely more polite.
They do all they can to oblige you, and always accom-
modate the Franks or Europeans, with stools. They
are, however, taxed with dissimulation, and insincerity,
and not without some reason. They are uncommonly
fond of tobacco, particularly that from America, which
they smoke in great quantities.

In smoking, they use a glass decanter, called a callaan,
filled about three parts with water. The tobacco is
rolled up like a ball, and put into a small silver vessel
like a tea cup, to which a tube is fastened that reaches
almost to the bottom of the water; another tube being
fixed above the water to the neck of the vessel, the
smoke is drawn through the water, by which means it
becomes cool and pleasant. Mr. Hanway says, that in
Persia there is a custom which to an European trav-
eller may appear exceedingly disagreeable; that is, if
he gives an entertainment to any capital person of the
country, he is obliged to provide a great quantity of
sweetmeats, not so much to entertain the master, as to
distribute among the servants.

The Persians are superstitious to the last degree; the
twisting of the features, the hands laid across, the
fingers interchanged, and other particular gestures of the
body they fancy are full of magic power. Meteors, or
what are commonly called falling stars, they suppose to
be the blows of angels upon the heads of devils. Cats
they venerate, but dogs are held in the greatest disre-
spect. Sneezing is a good omen, but yawning a bad one; nay,
a person who was first for by one of the emperors, fancy-
ing his life in danger, assured an English gentleman, that
his fate depended upon the repetition of a certain prayer,
when he came into the presence of the Shah. For, said
he, "If I repeat it perfectly, I shall escape with my
life; but if I should happen to omit a single syllable, or
even to pronounce a word improperly, I shall certainly
be a dead man."

The Persians are romantic in their thoughts, and en-
thusiastic in their manner. They are all fond of poetry,
but their poetry is all hyperbolic; yet, though a
voluptuous people, their writings upon love are delicate,
and the sentiments they inculcate refined. Their poetry
has generally a moral turn, and their elegies and
pastorals usually insinuate, that though their law permits
them to marry four wives, yet reason should confine
them to one: that the enjoyment of a beloved woman is
a virtue, because natural; but that celibacy is a vice,
because it operates against the grand active principle of
nature, which is to increase the human species. There
the poets have more sense than the priests, and the
lower class of people are greater philosophers than the
legislators. The Persians, indeed, think poetry the most
sublime science, and smoking tobacco the most rational
amusement. If they are condemned to die, they cheer
themselves with a couplet, and then meet their fate
without the least fear; and when the smoking of
tobacco hath been prohibited by the emperors, many
Persians have left their country and settled in foreign

parts sooner than be deprived of this voracious pleasure.

The Persian dancing is not disagreeable though irregular, but the music is intolerable, at least to an European ear. After the music is finished at any entertainment, the principal musician presents an orange to the company, which is a civil indication of his expecting a handsome gratuity for himself and band. At these entertainments the company usually drink strong liquors in tea cups, till they are quite intoxicated, each having a plate of sweetmeats before him.

There are not any people in the world who think less of the future than the Persians; they are fond of enjoying the present minute, and trust entirely to Providence for all that is to ensue. Their genius is penetrating, and their fancies lively. Their capacity is great for arts, sciences, war, and mechanical employments; but their profuseness, luxury, and indolence, counteract their natural abilities; and the unfortunate policy of their rulers, is a great bar to every thing useful and liberal, and militates against every propensity to improvement. Their gold and silver laces are admirable, and preserve their lustre long. They understand pottery tolerably, make good porcelain, and are famed for their skill in china rivetting. They are acquainted with the glass manufactory, but not so well as to be able to make looking glasses.

The Persian silk weavers are equal to those of any country in their silks and fannies. Their silk, mixed with cotton, camels, or goats hair, their tabbais, tassities, brocades, gold and silver tissues, &c. are admired all over the world, the workmanship being excellent, and the figures lively; but the latter indeed are usually out of proportion, as the Persians know very little of drawing, and nothing at all of perspective; the excellency of their colours therefore admits of their being admirable dyers, though they are but bad painters. They usually design in profile, as they are very unsuccessful in drawing full faces, or front figures. They have neither modellers, statuaries, or engravers, which, as well as the insufficiency of their painters, may be owing to some rigid religious tenets, that prohibit the artificial imitation of any living creature. They are perfectly well skilled in varnishing, and their turners and joiners are tolerable, but their carpenters are sad bunglers, which is owing to the great scarcity of timber throughout the whole empire.

They have no locksmiths, and even the locks to their fire arms are purchased of the Europeans. The barrels they make exceedingly strong, but the stocks are abominably clumsy. They use neither brass, iron, nor pewter in their kitchens, all their culinary utensils being made of copper, well tinned; their braziers and tin-men being very good workmen.

As they cannot make looking glasses, their cutlers, who are excellent mechanics, make steel mirrors, which supply the deficiency; their sword and sabre blades cannot be excelled; their knives, razors, scissars, &c. merit commendation.

As the Persians are admirable archers, and plume themselves exceedingly on their skill in the use of the long bow, the bow-makers take infinite pains in making that weapon as strong and as elegant as possible; the materials are wood or horn bound round with sinews, and strung with twisted silk, the quivers are made of leather finely embroidered with silk, gold and silver twist, &c. the leather is exactly the same as that which in Europe is called Turkey leather.

The Persian tailors fit their cloaths as well, and few much neater than the European tailors. Many of them work flowers upon garments, carpets, cushions, and curtains, in an admirable manner. The excellency of the Persian garments consists in their being light, airy, and short: their dress consequently does not impede their natural activity, nor give them that air of indolence and effeminacy, of which the long flowing robes of the Turks are productive.

Their saddles are superior to any in the universe, with respect to the workmanship in general, and the embroidery and stitching in particular; the stirrups are short, but very beautiful.

The Persians are exceedingly fond of all kinds of ornaments made of jewels, such as little coronets, plumes in imitation of feathers, and knots resembling flowers for the heads. In some provinces they wear a ring through the nostrils set with a variety of stones; and many young ladies adorn themselves with a splendid necklace of diamonds and rubies, which is suspended by two gold rings that are run through the ears; their arms are decorated with bracelets of jewels or pearls, or with little manacles set with precious stones where they shut. Their necklaces fall into the bosom, and have a little gold box containing musk or amber hanging to them. All who are able load their fingers with rings; the lapidaries polish the stones in a tolerable manner, but the jewellers set them very awkwardly, nor are the gold and silver-smiths better workmen. Mechanics in Persia are indeed much respected, and a merchant is placed on the footing of a person of the first rank; but the Persians in general consider the matter more than the manner of every article, and value it for its intrinsic worth, more than for the beauty of the workmanship, which renders their artists very careless about making improvements. They are fond of watches, but not one of their mechanics knows how to make or even to mend a watch; they admire printing, yet never attempt to introduce that art into their country, though they confess its utility as often as they mention it. Few work in a shop or have a shop-board; but the generality of artificers and tradesmen go to the houses of those who have occasion to employ them, and sit upon the ground, or do their work in any other posture which is most suitable to the business they are upon.

The wire-drawers are good, and the tanners excellent, not only at tanning leather but shagreen, which is made of the rump of an ass; salt and gall serves them for all the purposes of tanning, bark being unnecessary on account of the dryness of the air.

The brick-makers mix the clay with chopt straw, and then make the bricks in wooden moulds, of eight inches long, six broad, and two and a half thick. They then dry them singly for three hours, and afterwards together for a much longer space. These bricks are dried in the sun, but those which they dry with fire, are much larger, and are likewise made in moulds, the composition being two parts clay, and one of ashes; and the kiln, in which they are dried, is usually about twenty seven cubits in height.

We have already mentioned the great scarcity of timber in Persia; it is therefore not to be wondered at that in their buildings scarce any thing is made of wood except the doors and sashes. The houses in general consist only of a ground floor, the bottom being earth, or cement, though some are paved, and the roofs flat, as they are exceedingly fond of enjoying the serenity of the evening on the tops of their houses, which are usually situated in the midst of pleasant gardens, and excluded from public view by high walls. If the master has occasion to transact any business, he does not introduce a stranger into his house, but settles the affair in hand under the piazza in the front of it; for no Persian house is without such a piazza.

Next to the piazza of most houses is a hall of entertainment, which is always arched or vaulted, and consequently forms a dome; and indeed no country in the world has so many stately domes belonging both to public and private buildings as Persia. Several doors open into this hall, which in hot weather are all set open in order as much as possible to draw the air, and encrease the velocity of its circulation. The walls are built with bricks, the roofs are surrounded either with a wall or balustrades, and the Persians not only take the air on them when the evenings are fine, but frequently carry up mattresses, and lie there all night. The kitchens and offices are detached from the habitations; the fire place consists of a hole in the earth, where a charcoal fire being kindled, a kind of table covered with a carpet is put over it; beneath this the Persians sometimes put their legs to warm them. The smoke is carried away under ground through pipes, as there are very few chimneys in the whole country. The doors are small and inconvenient, and are hung on without hinges, being fastened

In the day time their beds, which consist only of a
couple of cotton quilts, are placed in niches; at night one
of these quilts is folded double, and laid upon the car-
pet, for no person in Persia is without a carpet, and the
other is used for a covering. They are likewise accom-
modated with a little square pillow. They go early to
sleep, and only throw off their upper garment, so that
they are soon dressed and undressed; they have little be-
sides in their apartments except sofas or cushions to sit upon,
and pillows to lean upon, for they hate to have their
houses crowded with superfluous, or unnecessary furni-
ture.

The Persian language is spoken in common through-
out the whole empire, but more correctly in some pro-
vinces than others. The Turkish language is the polite
or court language, and the Arabic is the learned lan-
guage, in which all the books on sublime subjects are
written.

The Persian alphabet consists of twenty eight letters,
none of which are vowels; their accent serves in lieu
thereof, and points out how the voice is to be modulated,
and the consonants pronounced; they have no stops,
but begin every sentence with a capital letter; but in
whatever language they write, they always make use of
Arabic characters; they write from the right hand to the
left, like the Hebrews; and instead of quills, they use
reeds to make pens of.

The Persian paper is a composition of cotton and silk
rags, which is glazed by the compression of a smooth
stone; their letters are nicely rolled up, for the paper
being exceedingly thin, will not bear folding as the
European paper does; they are then fastened with gum,
and sealed with a cypher or some verses of the Koran,
which are usually engraved on the Persian rings: the
impression is made with a thick stick, composed of galls,
gum, and burnt rice.

As there are no printing presses in Persia, the books
are all manuscripts; but the writing is beyond descrip-
tion beautiful and correct; they write eight different
hands, but esteem that most in which the Koran is writ-
ten; this hand is called the Neskhy.

The sciences flourished in Persia before they did in
Europe, but the modern Persians fall very short of the
Europeans in every branch of learning; they are very
unskilful in the arts of tuition, while superstition fet-
ters, and affectation degrades, literature in its progress.
They are exceedingly fond of astrology, which they
term the key of futurity; they place an implicit con-
fidence in their astrologers, who are all natives of Cho-
raasan, and pretend to be descended from the ancient
Magi. They use an astrolabe to find the situation of
the stars, and can name the signs of the zodiac; but
they know little of either the terrestrial or celestial
globe; and understand nothing more of arithmetic than
the four fundamental rules.

They calculate eclipses tolerably well, but dread the
thoughts of comets. Their Almanacks are an absurd
mixture of astronomy and judicial astrology, morality
and predictions.

The grand Epocha by which they date all events, is the
Hegira, or flight of Mahomet from Mecc, which took
place A. D. 622. They reckon twenty four hours to
their day, but do not subdivide it into day and night as
we do. As they begin their week on Saturday, Friday
is their Sabbath. Their year begins at the vernal equi-
nox; their solar and lunar years differ in the space of
twelve days, because they reckon but twelve moons to
their lunar year.

The Persians have great natural parts, but make a bad
use of them. Their genius is but little cultivated by
education, and less by experience, as they never travel
into foreign countries, and the sameness of customs and
manners in their own, does not afford a sufficient variety
for observation. They have however universally a taste
for poetry, as all people of figure keep a poet in the fa-
mily, who produces the effusions of his fancy at all en-
tertainments, in order to divert the company; and in all
coffee houses poets are to be met with, who omit no
opportunity of giving specimens of their abilities. In-

deed the Persians excel more in this science than in any
other, which is owing to the liveliness of their imagi-
nations, the fertility of their inventions, and the natural
softness of their language in writing; they always mingle
poetry with their prose, and frequently utter rhymes in
their common conversation. They think that all philo-
sophers and moralists should be poets, and say that the
most sublime truths never appear so engaging as when
delivered in verse. Their historians indeed are rather
too poetical, and mingle many fables with facts in their
writings.

Physicians are much esteemed in Persia; they pretend
to discover diseases by the pulse, as they do in China,
and know how to demand a large fee as well as any of
their brethren in Europe. They are perpetually at va-
riance with the astrologers; for when a physician pre-
scribes a medicine, the patient will not take it till an
astrologer has consulted the stars, to fix precisely the pro-
per time. If the medicine fails of success, the physician
blames the astrologer for making a mistake in his calcu-
lation, and the astrologer retorts by accusing the physi-
cian of administering what was improper in the case.

The physician is druggist, apothecary, and chymist,
but is totally ignorant of anatomy, as well as the sur-
geon. Indeed the Persian surgeons are some of the most
ignorant in the universe.

What little the Persians know, is injured by their
affectation, and self-conceit prevents their making a
greater progress. Even their principal virtues, hospita-
lity and humanity, are tainted with ostentation; and
the nobler pursuits of the mind, and emotions of the
soul, are suppressed by their numerous vices, among
which we may number lying, cheating, flattery, dissimu-
lation, luxury, idleness, voluptuousness, &c. They
are however pretty temperate in eating and drinking;
they have coffee for breakfast, and at about eleven o'clock
dine on milk and fruit, particularly melons, which is
the only thing that they seem to be intemperate in eat-
ing. Their chief meal, which is at night, consists of
pilau, or boiled rice, and fowls or mutton; they use
high seasoning. A cloth is spread upon a carpet, their
handkerchiefs serve for napkins, they sit down crossed
legged, and dip their fingers into the dish to feed them-
selves, knives and forks not being used at meals in Per-
sia, as we have already observed. They drink water
and sherbet publicly, and wine privately, though it is
prohibited by their religion. They likewise chew opium,
but not in such great quantities as the Turks.

The Persians salute by an inclination of the head, and
putting the right hand to the breast upon the heart. Be-
fore the king and great men, they bow with their faces
three times toward the ground; but near relations, and
familiar companions, salute thus. He who pays the
compliment, presses one of the other person's hands be-
tween both his own, and then gently raises it up to his
forehead, which is expressive of the highest and most
cordial esteem.

The Persian bagnios are usually round, though some
few are square. The roofs are covered with painted
tiles, the walls are of a beautiful kind of white stone;
each is covered with a dome. In the centre of the build-
ing is a large hall, floored with marble, and a capacious
balcony to bathe, round which are the apartments to dress
and undress in.

When the baths are ready in the morning, a servant
goes to the terrace on the top of the building, and blows
a horn, to give public notice of the same. The men
bathe in the morning, and the women in the afternoon.
When the men have done bathing, the male attendants
all withdraw, and are succeeded by the females, who are
appointed to attend the women. No people of any very
great consideration, however, go the public baths, as
they generally have baths in their own houses.

Bathing is not only enjoined to the Persians by their
religion, but it is particularly conducive to their health,
on account of their never entirely undressing themselves
when they go to rest. Add to this, they reckon it among
their principal pleasures.

Besides being well rubbed by the attendants at the bap-
tism, the barbers shave them with incredible dispatch
and ease, and there cut the nails both of their hands and
feet;

fect, chafe the flesh, and give them a very rough pull of both the arms, in order to stretch the nerves.

In Persia they have neither wheel carriages, nor palanquins. The men convey themselves and their goods by the means of camels, horses, and asses; and when the women travel, they are put into a kind of square boxes, covered over with cloth, which is suspended by hoops at the top. These boxes are hung like panniers on each side of the camels.

The Persian marriages are usually founded upon mercenary motives; the legal wife being intended as a superintendant of the other women. They are indeed allowed by law to have four wives, and as many concubines as they please, but they seldom marry any more than one; and it is impossible that they should ever marry for love, because they never see their wives till after the contract is so firmly made by the parents, or friends, that they cannot recede from the agreement. The children of concubines and slaves inherit equally with the children of wives: therefore there is no such thing as bastardy in Persia.

The first preliminary of marriage is the registering the contract before the civil magistrates. The bridegroom then sends a rich present to the bride. On the ensuing evening, he proceeds in grand procession to the house where the bride resides, mounted upon a fine horse, richly caparioned, and attended by a band of music. By the way the bride meets him, attended by her friends; she is mounted upon a horse or camel, and veiled so as not to be seen. The cavalades having joined each other, return together towards the bridegroom. The bride being led to the apartments designed for her, the bridegroom soon follows, and for the first time in his life is permitted to see her. But the Persians are not under the necessity of taking a wife for life, as they are allowed by law to marry for any limited time.

If a man wants to part from his wife through mere whim, and chuses to be divorced from her, though she hath not committed any fault, he is obliged to pay the dowry contracted for at the marriage. Divorces are easily obtained, and both are permitted to marry again. Boys are of age at thirteen, and are legally authorized to contract matrimony. Girls are marriageable when nine years old. The eldest children are the guardians of the rest; and the estates of minors cannot be seized for the debts of parents. The effects of those who die intestate are distributed by the civil magistrates among the relations of the deceased, according to his own discretion.

The Persians in general bury their dead; but the gairs, or descendants of the ancient Persians, expose them to be devoured by birds of prey, or other voracious creatures.

When a person is on the point of expiring, the Persians kindle fires at the tops of their houses, which serve as beacons or signals to neighbours and travelling strangers to offer up their prayers for the patient.

The mollah or priest being sent for, he exhorts the sick person to repentance, who usually says, Taube, or I do repent. The breath is no sooner out of the body, than the surviving relations and friends set up a terrible screaming, and like the Irish, make use of many affectionate expressions to the dead corpse, bewailing his fate, and declaring their affliction to be past remedy.

The corpse is wrapped in a kind of winding sheet, on which many passages of the Koran are stamped or written. The coffin is filled with perfumes, salt, and lime.

In the funeral ceremony, the horses, turban, and arms of the deceased, precede the corpse. There are no appointed bearers to carry a coffin to the grave in Persia, as every one, from religious motives, make a point of assisting at funerals. Even the people of quality, when they perceive the appearance of a burying, will alight from their horses and help to carry the corpse to the ground. The face of the dead person is laid towards Mecca, and an arch is built on that side near the grave.

The relations of the deceased carry provisions to the grave for several days after the burial, and very seriously expostulate with the defunct on his unkindness in leaving them.

They mourn in ragged clothes, but not in black, which

is a colour they hate; but their mourning lasts only forty days. Widows, however, seldom marry after they have lost a husband by death.

The Armenians of Julpha mourn annually at the graves of their deceased relations and friends, on the vigil of the festival celebrated in commemoration of the discovery of the holy cross. Early in the evening the women proceed to the burial places, clothed in white. They kindle fires with wood and coals, which they carry thither for the purpose, place lighted torches, and burn incense on the graves, and pass the night in sad lamentations. A multitude of priests dressed in black attend, who repeat a set of prayers for six, ten, and twenty-pence each.

S E C T. V.

Ecclesiastical, Civil, Political, and Military Establishments, &c.

AFTER the death of Mahomet the impostor, two competitors appeared, and claimed the privilege of succeeding him not only in spiritual matters, but in temporalities; these were Hali, the husband of his daughter Fatima, and Abubekar his wife's father. Several engagements ensued between the contending parties with various success. The death of Abubekar seemed to promise a cessation of hostilities, when Omar, one of Mahomet's generals, started up and revived the pretensions of Abubekar, and had great success. Upon his death, one of his kinsmen named Osman succeeded him, but dying in the 34th year of the Hegira, Hali became acknowledged by all parties as the successor of Mahomet; but upon his death, the officers of the army declared the throne to be void, and the crown elective, which militated against the interest of Hosien the son of Hali.

Hosien raised an army to oppose Mehiviah, another of Mahomet's generals, whom the officers had elected. Hosien was, however, defeated and slain, and eleven of his sons put to death, but a twelfth son made his escape, from whom many of the succeeding Persian monarchs have asserted that they were descended.

With respect to religion, the Persian sect of Mahometans adopt the principles, and follow the doctrines of Hali, as the Turkish doth the commentaries of Abubekar, Omar, and Osman, whom the Ottomans deem the genuine successors of Mahomet.

These sects are at perpetual variance with, and even anathematize, each other in their prayers. The Mahometans term themselves Mussulmen, which signifies faithful; their tenets are to believe there is but one god, and that Mahomet is his prophet; and they are strictly enjoined to observe, corporal purifications, prayers five times a day, alms, fasting, and pilgrimage: to the above articles the Persians add, that it is absolutely necessary to believe that Hali is the vicar of God.

The generality of Mahometans believe in transmigration, and many, that no punishment can be eternal. Their paradise is certainly sensual, though many of their doctors of a superior understanding, are ashamed of that sensuality, and assert, that it is only allegorically so, and that the prophet spoke to the passions of men, in order to awaken their reason.

The Persians place Hali far above Mahomet, and distinguish uncleanness into absolute and accidental. Absolute signifies drunkenness, gluttony, &c. Accidental, what is not of our own will and seeking.

As they are obliged to pray five times daily, they are obliged to wash their hands as often, for it is one of their principal maxims that prayers are not acceptable in heaven, if the supplicant's hands are not washed before he begins his ejaculations.

There are a variety of superstitious formalities to be observed in their ablutions and purifications, such as taking up the water in the left hand, and pouring it into the hollow of the right hand, then washing therewith their hands, arms, and feet. They are likewise obliged frequently to shave their heads and faces, and clear themselves entirely of all excrementitious hairs.

The general purification or washing of the whole body, is performed previous to a pilgrimage, a fast, or some extraordinary act of devotion.

mourning lasts only seldom marry after they

ASIA.]

EMPIRE OF PERSIA.

69

With respect to their diurnal prayers, the first prayer must be when the sun is in the meridian, the second when it is forty-five degrees above the horizon, the third when the evening sets in, the fourth when they lie down to sleep, and the fifth in the morning.

To make their prayers acceptable, the Persians are taught that they must observe the following particulars: attention and application, fervency, faith, modesty, reverential love, hope, purity of mind, and purity of body.

The gestures are likewise to be minutely regarded; the suppliant must turn his face towards Mecca, divest himself of shoes or slippers, and all ornaments, the skins or furs of unclean animals, &c. lift up his hands, and prostrate himself to the earth. He must likewise never offer up a prayer in any place where there are statues, images, pictures, &c.

A Persian must not pray on the bare floor, but always have a carpet on purpose: upon this he kneels down, and spreads an Alcoran, a bead-roll, a comb, a pocket-glass, and an earthen dish; then taking the glass and comb, he combs his whiskers. Their beads are thirty-nine in number; the little dish contains holy earth, and is the same kind of mould of which the beads are made: but when they pray they are not permitted to have sabre, sword, pistol, or even money about them; as offensive weapons and worldly pelf they imagine would render their prayers fruitless.

In the Persian mosques the priest rather acts as a master of the ceremonies, than as a clergyman, for his business is neither to preach or pray, but to keep order. All the prayers which are said in the mosques are taken from the general Mahometan liturgy; but every one begins where he thinks proper, and chuses out what prayer he pleases, without regarding the rest of the congregation; but then the Persians repeat their prayers so low, that they cannot disturb each other.

Though the Persians are pretty well acquainted with the causes of eclipses, thunder, lightning, earthquakes, &c. yet they imagine all those natural phenomena to be so many evidences of God's displeasure towards mankind. But great as their superstition may be in this, and many other respects, they worship God only, and pray that he would increase their worldly happiness, as well as immortal felicity, without having recourse to any saint as mediator: they do not even request the intercession of Mahomet or Hali, though they so highly reverence them.

Alms in Persia are of two kinds, viz. legal and voluntary. The legal are tithes, which are not given to the priests, but applied to charitable uses; the clergy having sufficient revenues applied to their sole use. The voluntary charities are usually given to the faquirs, or Mendicant friars, to be appropriated to relieve insolvent debtors, distressed strangers, and to erect and establish works of a public nature, such as caravanferas, bridges, refer-voirs, &c.

The ninth month in the year, called Ramezan, is the Persian Lent. When this moon first appears, the cryers every where proclaim it as a signal happiness, and a general hymn is sung to welcome its appearance; the streets are illuminated, horns sounded, and a general joy diffused itself through the whole country. The baths being ready, the people wash and purify themselves, in order to enter upon their devotion. The conclusion of the Ramezan is celebrated in the same manner as the commencement.

During this grand fest the people are permitted to eat every evening, but they must not taste any thing till the public cryers proclaim the order for them to do; which proclamation is made when the sun's disk is below the horizon; they are then allowed to eat sweetmeats, fruit, and other light foods; in a few hours after they go to supper, but eat slowly and abstemiously, as they deem it very dangerous to eat eagerly after fasting.

The Persians observe three grand festivals, viz. 1. The new year. 2. The commemoration of Abraham's sacrificing his son. 3. The martyrdom of Hossien.

At the feast of the sacrifice, those who intend to celebrate ride out early in the morning, and sacrifice a sheep or a goat; then returning home, they order many more

sheep and goats to be killed, cut up, and distributed among the poor. But the principal sacrifice is that of a camel, at which the emperor himself is present.

On the first day of the feast the devoted camel is led through the city, adorned with flowers, and preceded by music, which ceremony is repeated till the twelfth day, when he is brought to the houses of all the great people, who give money and provisions to the poor. The animal being then lead to an adjacent field, the emperor, with his imperial crown upon his head, and his whole court attend.

The camel is then made to kneel with his face towards Mecca; the priest repeats some prayers, and the governor or chief magistrate of the city wounds him: the head is then cut off and presented to the king, the four quarters and the trunk are given to the five wards of the city of Isfahan, where they are sold by certain families who have that privilege, and preserved till the next year, when they are distributed in morsels to the populace. The reason for using a camel upon this occasion is the supposition of the Persians, who fancy that Abraham did not sacrifice a sheep, but a camel.

The festival in commemoration of Hossien and Hassen, is observed as a solemn time of mourning, fasting, and tribulation; it lasts twelve days, when altars are erected at the corners of the streets, and a variety of trophies laid upon them. At night the streets are illuminated, pageants are carried about, and the priests repeat the legends of Hossien and Hassen, who were two celebrated Persian patriarchs, or imams, that perished in the wars with the Saracens, in the sixty-first year of the Hegira.

Mr. Hanway gives the following account of the religion of the Gauris, or Gebers, the posterity of the ancient inhabitants of Persia. "This religion was founded by Zoroaster, who lived about the year of the world 2860. This great philosopher, being struck with the demonstrations he observed of the perfections of that self-existent Being who is the author of all good, and being at a loss how to account for the introduction of evil into this world, thought there were two principles or beings, one the cause of all good, whom he imagined resembled light; the other the author of all evil, whom he represented by darkness. Thus considering light as the most perfect symbol of true wisdom, and darkness as the representative of whatever is hurtful and destructive, he inculcated an abhorrence of all images, and taught his followers to worship God only under the form of fire; considering the brightness, purity, activity, and incorruptibility of that element, as bearing the most perfect resemblance of the nature of the good Deity. Thus the Persians shewed a particular veneration for the sun, as the brightest image of God, and offered up their sacrifices in the open air, and generally upon the top of a hill, for they esteemed it injurious to the majesty of the God of Heaven, to shut him up in walls, who fills immensity with his presence.

"About six hundred years after the first Zoroaster, another philosopher of the same name arose, who taught, that under the supreme Being there are two angels; the one of light, who is the author of all good; the other of darkness, who is the author of all evil: that they, by a mixture of light and darkness, made all things, and are in a perpetual struggle with each other; that where the angel of light prevails, there good reigns; and where the angel of darkness, there evil predominates. That this struggle shall last till the end of the world, when the angel of darkness, and his followers, shall forever be separated from the angel of light; but those who cherish their spiritual nature, and obey the angel of light, shall go with him into a world, where they shall be rewarded amidst everlasting brightness, and triumphant glory. In short, this last Zoroaster taught temples to be built, in which the sacred fire was ordered to be constantly kept. These opinions, with a few alterations, are still preserved by the Gebers, or Gauris, the posterity, as we have said, of the ancient Indians and Persians, who are very zealous in preserving the religion of their ancestors, particularly with respect to their veneration for fire."

The everlasting fire of the Gauris is a singular phenomenon: it is situated about ten miles from Baku, a city on the Caspian Sea: there are several stone temples, supposed

supposed to have been anciently dedicated to fire. In particular there is a little temple where the Gebers, or Gaus, now perform their devotions. From the mouth of a hollow cave that is placed near the altar, a clear blue flame issues, which the Indians and Persians affirm hath continued ever since the flood, and will remain unexhausted till the end of the world. Forty or fifty poor devotees usually reside here, who come on pilgrimage from different parts, and live very abstemiously, feeding on nothing but vegetables. Their continuance here is longer or shorter, according to the number of people they have to pray for, as they pretend to make expiation for the failings of others, as well as their own. They have an uncommon veneration for a red cow; mark their foreheads with saffron, and keep one of their arms unalterably fixed in a certain position, either upon their heads, or some part of their body. Their clothing is but trifling, and their bed the bare earth. This austere method of living procures them great reputation for piety among the Gaus, and even occasions them to be respected by the Persians. Near the temple, a blue flame resembling that within it, issues from a cleft in a rock; and the soil, for a considerable space around, seems impregnated with fire, as we have already described in the natural history of Persia.

The Gaus in general wear hats, which in a great measure resemble those worn in Europe. Their principal garment is a short close vest; and they suffer their hair and beards to grow long. They think little or nothing of human learning, and despise traffic. Agriculture and gardening they deem the most honourable, as they were the primitive employments of mankind; hence, the reason may be deduced why Persia was more fruitful and populous in ancient times, when all the inhabitants were of the religion of Zoroaster, than it is at present under the Mahometans, who all hate husbandry. Nevertheless, some of the Gaus are tolerable mechanics, and in general they are deemed a quiet, inoffensive people, and have been hitherto permitted by the Persian government to have their own magistrates, and to be regulated by their own peculiar laws, as far as they do not clash with the general welfare of the state.

They drink wine, and eat every kind of meat, beef excepted; but never intermarry with any other set of people. This, indeed, is of personal disadvantage to them, for they are neither so fair, so finely featured, nor so well made as the Mahometan Persians, who will not, if possible, either marry or co-habit with any women, but the beauties of Georgia and Circassia; great numbers of these lovely females being annually bought by the rich, and stolen by the poor Persians. And it is proper to observe, that since the commencement of the custom of procuring wives and concubines from those places, many of the Mahometan Persians are much improved both in features and persons, and at present are very near as beautiful as the Georgians and Circassians themselves.

The Gaus suffer a man to take only one wife, and prohibit the cohabiting with concubines, and divorces, unless a woman continues barren for the space of nine years, when they are permitted to take another.

As the Armenians are numerous in Persia, it is proper to speak of their religion, which comes nearest to that of the Greek church of any other. They are tolerated in Persia, and even their patriarchs, archbishops, bishops, &c. are appointed by the Persian government.

It seems that the Romish missionaries have been at infinite pains in trying to persuade the Armenians to acknowledge the papal supremacy; but their endeavours have always proved abortive; for their aversion is stronger against the Roman catholics than against the Mahometans: they are so zealously strenuous with respect to religion, that few of them have been known to apostatize, though the temptations to turn Mahometans are exceedingly alluring; for all the estates and effects of the parents and relations become the property of the convert the moment he is acknowledged as a muselman. The Armenian monks must not marry, but the rest of the clergy may; though a priest is not permitted to say mass for the space of seven days after his nuptials, and

when he does say mass, he must be shut up in the church five days previous, and five days subsequent, to his performance of that ceremony; during which time he must have nothing to taste but vegetables and water; but a second marriage totally incapacitates him from officiating ever after.

Their fasts take up one half of the year, when the clergy and laity are equally obliged to abstain from flesh and flesh, and not to eat any thing till after sun set: many of the principal clergy eat meat but four times a year.

They believe in transubstantiation, and never receive the sacrament in Lent. When they baptize a child they immerse it three times in cold water, and then anoint it with holy oil; when the priest repeats, "I baptize thee in the name of the Father, Son, and Holy Ghost." The oil is made by the patriarchs of aromatic drugs, and flowers of the finest flavour, by whom it is sold to the bishops, who retale it to the inferior clergy; it is sold extravagantly dear, and no baptism is deemed legal without it.

After the child is baptized, the sacramental bread and wine is put into his mouth, when it is carried home by the godfather, who is preceded by several priests carrying lighted flambeaux, music, &c. and the day is concluded with the utmost festivity. A godfather is prohibited from marrying with a godchild; and even males and females of different families, who have had the same godfather, must not intermarry.

The Armenians admit of the ceremony of extreme unction, but do not believe in purgatory. They imagine that after death, even the virtuous will not go to heaven till the resurrection, but only be comforted with the conscious satisfaction of having spent their lives well. Concerning this and many of their other religious tenets, their ideas are extremely confused, vague and indefinite. They hate dogs as much as the Jews do pork, deeming them unclean creatures; and are as superstitious as the Mahometans with respect to lucky and unlucky days.

The baptism of the cross, in commemoration of the baptism of our Saviour, is the principal of all the Armenian festivals. The Moscovites, and some other Christians likewise celebrate this fast.

The Mahometans as well as Christians usually attend this festival, and many of the Persian emperors have been known to assist at it, though the Persians have now and then thought proper to insult the Armenians upon the occasion; but tumults are generally prevented by the attendance of a body of troops.

The ceremony is thus: The Armenian clergy go in procession to some river or reservoir of water, with a cross, banners, &c. After the prayers are read, and the anthems sung, the bishops plunge the cross into the water several times, and the people crowd as near as possible in order to get sprinkled with it; and this is the day usually chosen for the baptism of children. The Armenian children are all married while they are infants, which is a political precaution in the parents, to prevent their daughters from being sent to the seraglios or harems of the grandees; for the Persians are very particular in never committing adultery, or depriving any man of his wife; but though the contract is made in infancy, the co-habitation is not permitted till a suitable age. However, after the juvenile marriage, till the young couple are permitted by their parents, or other relations to come together, the bridegroom annually makes a present to the bride at Easter, of a fine silk garment and other articles, suitable to her quality and condition.

When the time appointed for the celebration of the nuptials arrives, the bridegroom richly dressed, and mounted upon a fine horse, proceeds to the house of the bride, attended by his friends and relations; the bride then mounts a horse, and being entirely covered with a veil, attends the company to the Armenian church, where the marriage is confirmed, and the bishop gives the young couple his blessing; they then retire to the bridegroom's house, preceded by torches, music, &c. a grand entertainment is given, and a few days after the bride's portion is paid.

EMPIRE OF PERSIA:

71

in linen, but not put in a coffin; prayers are read over it in the church, where lamps and candles being lighted it is left all night. The next morning it is carried to the gate of the principal clergyman of the place, who prays for the repose of the soul of the deceased, after which the corpse is taken to the grave and interred.

Besides the above, there is a sect in Persia termed St. John's Christians, whose religion seems to be a jumble of Christianity, Judaism, and Mahometanism. The Jewish religion is tolerated, and a great number of Jews are spread over the whole empire.

With respect to the constitution and present state of Persia, little can be said with certainty; for a modern traveller who was lately upon some important business in that country, informs us, that when he was there, "The Persians were governed by no fixed laws, but by the immediate will and pleasure of their governors; they make indeed profession of religion, but that was only nominal, and extremely superficial; as for customs, they were altogether abolished, unless robbery, beating and murdering one another, be allowed to be their customs." It would be however unpardonable to omit the following particulars.

Persia is an absolute monarchy in the utmost extent of the word, as the properties, and even the lives of the people are at the absolute disposal of the prince. There is no established council, but the Shah takes the advice of whom he pleases. The crown is hereditary in the male line, females being excluded from the government, though the sons of a daughter are admitted to reign. The Persian laws will not permit a blind person to sit upon the throne, which is the reason why the reigning monarch usually puts out the eyes of all his male relations. It is death for any man to look at any of the Shah's wives, even by accident.

The prime minister is called Attamaet Douler, or the director of the empire; and his chief business is to ingratiate himself into his master's favour, and administer to all his caprices; to keep from his knowledge all manner of disagreeable news, to persuade him that he is the most powerful prince upon earth, and that all his affairs are in a prosperous situation, though at the same time he is perhaps on the point of ruin. In the same manner as the prime minister depends upon the Shah, the inferior officers and governors of provinces depend upon him; thus there is a gradation of despotism throughout the whole empire.

The nadir, or grand master of the household, is next in rank to the prime minister; then the mehter, or groom of the chambers, who is always a white eunuch. Besides the above, there are a master of the horse, a grand huntsman or Falconer, a chief justice, from whose sentence there is no appeal, a lieutenant of the police in every city and town, a secretary of state, a financier, a royal physician, an inspector of the palace, a master of the ceremonies, and many kans or governors of provinces. The spiritual officers are the zedder or grand pontiff, subordinate to whom are the sheik-el, seiom, and cadi, who determine all religious disputes, and act likewise as justices and attorneys; next to these are the picknamas, or superintendants of prayer, and the moulans, or doctors of the law.

There is no hereditary nobility in Persia, every man being distinguished and respected according to the office he holds under the prevailing faction; indeed the descendants of Mahomet, and the great patriarchs have a peculiar veneration shewn them.

The arms of Persia are a lion couchant looking at the sun as he rises over his back. The emperor's title of Shah signifies disposer of kingdoms. The Persian monarch does not subscribe his name to public instruments, but the deed runs in this stile viz. "This edict or act is given by him whom the universe obeys."

Little can be said with certainty respecting the Persian force, as perhaps no two of their monarchs ever had their armies upon the same footing; and the number of troops are usually proportioned to the exigencies of state. It is however proper to observe, that the troops are distinguished into two bodies called kortikies, and goulans; these are cavalry, and upon a peace establishment the former amount to about twenty-two, and the

latter to about eight thousand men; they are generally well kept, and regularly paid.

The kortikies are the descendants of foreigners, and the goulans are made up of Georgian renegadoes and slaves of all nations.

The tangchies or infantry are composed of the most hardy peasants, and amount to about fifty thousand men. The fortified places in Persia are in general despicable; and they had no great naval power till the time of Kouli Kan, who built a royal fleet, in which was a man of war of eighty guns. But it is imagined that they are laid up in the ports, and rotten, as nothing hath been heard of them since the death of that usurper.

S E C T. VI

Persian Antiquities, &c.

THE most celebrated, and singular antiquities in Persia, are the ruins of Persepolis, formerly a superb city, till it was destroyed by Alexander the Great, to oblige the Grecian courtizan Thais.

These ruins are at about the distance of thirty English miles from the city of Schiras. They are situated in a fine plain which is about 120 miles in length, and only 6 or 7 in breadth. This plain is overflowed with water several months in the year, which occasions it to be so exceedingly fertile, particularly in rice, that it is covered with little villages, or hamlets to the number, as the inhabitants assert, of 880, including those which are situated in the adjacent mountains.

The ruins appear like an amphitheatre, and are situated in a kind of f-micircle formed by the mountains.

The ancient palace of the Persian monarchs, which was formerly called the house of Darius, and which the modern inhabitants term Chil-minar, or the palace of Forty Pillars, is situated at the foot of a mountain, which hath for time immemorial been known by the name of the Royal Mountain.

The walls of three of the sides are still standing; the front extends from north to south 3000 feet, and from east to west 1995 feet, to the mountain itself, where an ascent is formed between some scattered rocks, beyond which the rocks seem to indicate that there were formerly some other buildings, as many of the stones appear to have been polished.

At the summit of the edifice, there is a platform extending from the middle of the front wall to the mountain, being about 2000 feet in length. A pavement of about eight feet broad is carried along three sides of the wall, which is twenty-four feet in height in most places. The stones of the wall are harder than marble, finely polished, and of a black colour, and many of them are of an astonishing bigness. The principal staircase is between the middle of the front and the north-end of the building, and consists of two flights of steps, that wind from each other to the distance of forty-two feet. The steps are but four inches high, and fourteen broad, and in number are fifty-five on the northern side, and fifty-three on the southern; the latter being less entire than the former. It is imagined that there are many steps as well as part of the wall under ground. At the bottom of the above flights of steps, there is another flight extending fifty-one feet four inches. Above these flights there is a pavement of large stones, and another flight of steps leading to the ground entrance. These latter steps are exceeding magnificent, being seventy-five feet wide. There are two grand portals at the distance of forty-two feet from the summit of the upper steps: they are twenty-two feet four inches in depth, and thirteen feet four inches in breadth. Within each there is the figure of a sphinx upon a pilaster in bas-relievo. Both these figures are fourteen feet and a half high, and twenty-two in length, from the fore to the hinder legs, but they are much damaged, and the faces broken; that in the first portal faces the staircase, and that in the second the mountain.

There are some characters on the upper part of the pilasters, which from their minuteness and height cannot be distinguished. The height of one portal is thirty-nine feet, and of the other twenty-eight; the base of both is five feet two inches.

The

The bases of the columns which appear between the portals are covered with earth, but the capitals and other ornaments are in fine preservation, and indeed the whole are but little damaged: they are fourteen feet in circumference, and fifty-four in elevation. Anciently there were two other columns between these and the last portal, several pieces of which lie half buried in the earth.

South of the same portal, at the distance of fifty-two feet, there is an admirable basin of water, which though cut out of a single stone is twenty feet long, rather better than seventeen broad, and elevated about three feet and a half above the surface of the floor. A space of ground of about one hundred and fifty paces in length extends from this basin to the northern wall, and contains a great many fragments of large stones, and part of a column of twenty feet in circumference, which is not fluted like the rest.

Southward from the abovementioned portals there are two other flights of steps, the one towards the east, the other to the west. The upper part of the wall, besides foliage, and some small figures, is ornamented with the representation of a lion tearing a bull to pieces; the figures are larger than the life, and done in basso relievo. This stair-case is half buried under the earth.

Forty-five feet in length of a wall extend from hence beyond the lower part of the stair-case, between which and the western front, there is an interval of sixty-seven feet. This front corresponds with the former, and is embellished with three ranges of figures, which are interspersed with characters; among the figures, are a lion tearing an ass, that has a horn projecting from his forehead. On the other side of the stair-case there are three ranges of small figures, which are much defaced, being only visible from the wall downwards. The whole wall is ninety-eight feet in extent, and only five feet three inches in height. The figures are two feet nine inches high.

On the summit of the stair-case, there is an entrance into an open court, paved with large stones, the breadth of which is equal to the distance from the stair-case to the first columns, comprising the space of twenty-two feet two inches. There are two rows of these columns, each consisting of six pillars, all of which are damaged. Besides these, there are eight bases, and the ruins of several others.

At seventy-two feet eight inches distance, there formerly stood six other rows of pillars, consisting of six pillars in each row, which were at the distance of twenty-two feet two inches from each other; there are but seven of these thirty-six columns now remaining entire, but the bases of the others are still standing. Seventy-two feet eight inches from these, towards the western front of the stair-case, there were twelve other columns in two ranges, but there are only five of these remaining. The ground about here is covered with fragments of columns, capitals, ornaments, &c. among which are interspersed some curious pieces of sculpture, representing camels on their knees; on the top of one of the columns there is likewise the figure of a camel in the above-mentioned attitude.

Towards the east, a variety of ruins present themselves to view, consisting of windows, portals, avenues, passages, &c. The inside of the portals are ornamented with figures in basso relievo. These ruins from east to west are about 450 feet; from north to south about 725 feet; and 300 from the columns and mountains. In the middle, the earth is covered with the fragments of seventy-six columns.

Southward from these, at the distance of one hundred and eighteen feet, there is an edifice which appears to be elevated above the rest of the ruins, from its being situated on a hill. The front wall is composed of a single range of stones of eight feet in depth; it extends from east to west one hundred and thirteen feet, but is not embellished with any kind of ornament. In the center are the remains of a double stair-case, on the sides of which are several figures almost obliterated. The rest of the building, consisted of a variety of portals, which are now in ruins. The largest is five feet wide, and five feet two inches in depth. Towards the north there are two portals with windows, which are walled up,

beneath one of which are the figures of two women and a man, covered up to their knees with earth; and under the other the representation of a man holding a lion by the mane.

To the south there is a portal, and four open windows, the width of each being five feet nine inches, and the height eleven feet: on each side of the gate there is the figure of a man, with a kind of tiara upon his head, attended by two women, one of which holds an umbrella over him. Three niches on the inside are covered with characters in the ancient Persian language; one of the inscriptions signifies, "Strength is the gift of God alone."

To the westward there are two gates which are not covered. One of these is ornamented within with the figures of a man fighting with a bull. The other gate is embellished with the figure of a man, and a winged deer, from whose forehead a horn projects. Horns were anciently the emblems of majesty and strength, which occasioned the poets to give them to the sun and moon; and Alexander the Great is termed by the eastern writers Dhulkarnam, or monarch of the horns of the sun, that is, of the east and west, or the parts where that luminary rises and sets. Behind this building are the ruins of another, which in length exceeds the former by 38 feet. It has niches cut out of single stones and windows, a double flight of steps finely embellished with foliage, and small figures appear to the south.

Still farther southward there are some subterraneous passages, into which the natives will upon no account enter, though they are supposed to contain immense treasures; the only reason for which is an absurd notion, that no light can possibly be made to burn in them. However, Sir John Chardin and Monsi. Le Bruyn, at the time those gentlemen were there, entered with lights, which were not extinguished by some invisible power, as the superstitious natives supposed they would be; and after ranging about a considerable time, they both agree in their respective accounts, that these passages terminate in a small kind of aqueduct, which is too narrow to enter.

Near these subterraneous passages, are the ruins of another edifice, extending from north to south 160 feet, and from east to west 191 feet: ten portals of this building still remain, with forty enclosures, which were formerly rooms, and seven windows: in the center are the pedestals of 36 columns in 6 ranges. Beneath the ground, which is covered with several large stones, there are the remains of some aqueducts.

Another structure formerly stood to the westward of the last mentioned building; on the ruins of the wall, which is still elevated about two feet above the pavement, are the figures in basso relievo of several men with lances in their hands; within the enclosure of the wall there are the remains of several pedestals of pillars; on the east side of these ruins are the remains of an elegant stair case, of sixty feet in length, the steps of which are in general destroyed; the wall is still eight feet in height, and the figures which adorn it are near as big as the life; on the front are the figures of a lion and a bull fighting, and on the wings of the stair case the representation of several lions and other figures, with explanatory characters; between this and the last mentioned edifice are the ruins of several columns, and the remains of four portals, with the figure of a man, and two women holding an umbrella over his head, on the inside of each.

To the north of these, appear two portals with pilasters, on one of which are the figures of a man and two women, one of the latter holding an umbrella over the head of the former; above the women is a small figure with wings, which expand to each side of the portico; over the other portal is the representation of a man sitting in a chair with a staff in his hand, behind whom stands another with his right hand upon the chair; above is a small figure holding a circle in his left hand, and pointing to something in his right; beneath this portal are three ranges of figures, which have all uplifted hands: above the third pilaster, which is entire, are women holding an umbrella over the head of a man. The last ruins of the structure now appear; these are two portals towards the south, under each of which a man with a staff in his right hand is seated in a chair; in his left hand he holds a vase; behind him is another man, with a representation of a piece of linen in his hand, and the tail of a sea horse on his head. Three rows of figures, with uplifted hands, appear below, four in the first, and five in each of the other rows. The seated figures are larger than the life, the rest are three feet four inches in height: several ornamental foliage appear above; the higher parts decorated with the figures of oxen, and the lower parts with lions. On the summit of the whole there is a little winged figure, who hath a glass in one hand, and appears to be making a signal with the other. These portals are in depth ten feet four inches, and in breadth twelve feet five inches; the pillars are near thirty feet high. On each of the two which are placed northerly, is the figure of a man sitting with another behind him; and still farther back, another is seen holding something that is broken in his hand: before each sitting figure are two others, the one holding a vessel, the other in the attitude of salutation. Below these figures are five ranges of armed men, and above, alone with a variety of ornaments.

Some of the columns have capitals, and the others not, which is the only difference; the height of those that remain entire is about 72 feet, and the circumference 18 feet 5 inches, except those that are near the portals. The bases, which are circular, are in circumference 24 feet five inches, in height four feet three inches, and the lower moulding is one foot five inches in thickness: the ornaments consist of three kinds of capitals.

The drapery of the figures hath no affinity to the Grecian or Roman habits. The military dress is agreeable to the Persian and Median fashion. The figures in general are heavy, stiff, and inelegant; there is a similarity and want of taste throughout the whole. The stones are either yellow, white, grey, red, deep blue, light blue, or black.

Near the mountains are two ancient sepulchres of Persian monarchs, the fronts of which are ornamented with various figures; as there is a similarity in their structure, the description of one will suffice.

That part of the tomb on which the figures are cut is 40 feet wide. The height is nearly equal to the width at the base. On each side, the rock extends to the distance of 300 feet: four columns support the entablature, the capitals of which are adorned with the figures of two oxen to each, the fore legs being bent on the top of each column. The gate, which is at present almost closed up, is placed between two of these columns, and appears to have been embellished with a variety of ornaments. The entablature and cornice are adorned with eighteen small lions in basso relievo, nine on each side, with a vase in the middle; above the lions are a number of armed men in two ranges, consisting of fourteen in each range, who appear to lift up their hands as if to support the building above them. A kind of pillar capped with the head of an animal who has only one horn ornaments the sides. Towards the left, where the wall projects, there are three rows of niches, one above the other: in each are two figures of men armed with lances, and on each side are three others equipped in the same manner. On the right side are the figures of two men, with their right hands placed on their bodies, and their left on their beards; on the side of these are three others, in the same attitude as those on the opposite side; lower down, between these figures and a kind of pillar, there is on each side another decayed figure; above, on three steps, there is a figure with a bow in his left hand, of a royal appearance; he seems to point at something with his right hand, before him stands an altar, with a sacrifice on it, and flames ascending, and above it the representation of a moon, with a mystic figure over it.

Two leagues from these sepulchres, at a place called Noxi Rustan, there are four other tombs, which resemble the others, only they are cut higher in the rock. The place receives its name from a gigantic

prince, whose statue is there carved, and whom the natives assert to have been 40 cubits high, and 1113 years of age when he died.

The bases of the tombs are 18 feet above the causeway, and are about 72 feet in height and 60 feet wide; the rock is about twice as high as the tombs. Beneath each tomb there is a separate table filled with large figures in basso relievo. On two of the tables are the representations of men fighting on horseback, but the figures are almost obliterated. Between the tombs are three other tables covered with figures, among which is a man on horseback, preceded by two others, and followed by a third, which is almost defaced. These tombs cover the extent of 1400 feet, and a quadrangular building appears at the distance of about 300 feet from the first of them. The figures in general are dressed in the Roman manner; Rustan himself indeed is both dressed and armed like a Roman, and the figure of that prince and his horse are but of the ordinary size, though the natives have too greatly magnified his bulk. Before Rustan there is the figure of a woman with flowing hair, and a crown upon her head; another figure is the semblance of a military person with a tiara on his head, and his left hand grasping his sword; there are some figures almost defaced, which it is imagined were intended to represent men fighting on horseback: the above are all carved in the solid rock.

There are two tables on the western side of the mountain with figures likewise carved in the rock; that towards the left contains the representation of two men, one of whom grasps a circle which the other appears to have abandoned; it is thought that the former is emblematic of Alexander the Great, and the latter of Darius.

The tomb, supposed to have been that of Naxi Rustan, appears very evidently to have been made by Darius Hytaspes, as it exactly corresponds with the descriptions of Herodotus, Diodorus Siculus, and Ctesius in his Persian history.

At Pyrmaraas near the city of Scamachie, are the tombs of two Persian faunts. The first is the sepulchre of Seid-Ibrahim, which is surrounded with walls, and has two courts like a castle, within which are many arched apartments; in the first is a tomb inclosed within an iron grate. It has two steps to go up to it, and is about two feet in height. To the left is a light gallery, with white walls, and the floor is covered with tapestry. Through a vaulted apartment to the right, where there are eight tombs, is the passage to the shrine of Seid-Ibrahim, whose tomb, which is two feet in height, is covered with a carpet of yellow damask: at the head, feet, and sides, are a great number of wax candles in brass candlesticks, and many lamps are suspended from the roof.

At a small distance from the above is the famous sepulchre of another Persian faunt, called Tiroabba, of whom Seid-Ibrahim was a disciple. It contains several niches, chambers and holes where the pilgrims take up their abode, and perform their devotions; for a great number of pilgrims visit both these sepulchres, and have done ever since the reign of Shah Abbas, who prohibited the pilgrimages of Mecca, and exhorted the Persians to repair hither, which would be of equal efficacy. This he did with a political view, to keep within his own dominions those vast sums which were annually carried away by the pilgrims into the Turkish territories.

The sepulchre of Shah Sefi, near the city of Ardebil is visited with great pomp by the Persians on Whitfun-Monday. The entrance is through a spacious court, paved with broad stones, and furnished on both sides with vaulted shops. The gate is large, and crossed by a silver chain, from which another of the same metal hangs perpendicularly. The next gate has likewise a silver chain to it, and no person must pass it with any offensive weapons about them, not even a knife; the thresholds of this, and the following gates are round, and of white marble. The next court is long and paved, and hath shops on each side; at the upper end is a large vault, paved with blue and green stones, and hung with tapestry; in the middle are two large brass candlesticks, which on Whitfun-Monday have wax lights in them. The third gate which has a silver

silver chain over it leads to a court paved with small stones of several colours. The gate of the place of the sepulchre is built like a tower, and adorned with various silver plates and rings. At the entrance the pavement is covered with tapestry, and all persons are here obliged to pull off their shoes and slippers. From hence a capacious gallery covered with carpets, and hung with tapestry, leads to another gate covered with plates of gold; from whence there is an entrance to a large vault four fathoms square, enlightened by a great number of gold and silver lamps, some of which are three feet in diameter: this vault is divided from another only by silver rails, and an ascent of three silver steps. The latter vault is richer than any of the rest; at one end there is a compartment raised about a foot from the ground, and fenced off with rails of massy gold, which contains the tomb of Shah Sefi. The tomb itself is three feet in height, nine in length, and four in breadth, made of white marble, and covered with crimson velvet: from the roof a variety of gold and silver lamps hang down, and on each side are two very large candlesticks of massy gold, containing wax candles; on the left hand is a vault wherein are the tombs of Shah Sefi's consort, and some other empresses of Persia, and of Shah Ismael. Near this is a spacious arched gallery finely gilt, which is used as a library, and contains a great number of manuscripts in the Arabic, Persian and Turkish tongues, some written upon parchment and others upon paper, but all superbly bound, beautifully painted, and elegantly covered with plates of gold and silver. In various niches on the sides of the library there are above 400 porcelain vessels, many of them sufficiently capacious to hold ten gallons.

There is a kitchen belonging to this edifice, the doors of which are covered with silver plates: in this kitchen there is daily dressed as much provision as will feed 1000 persons; the poor having three meals a day distributed to them from hence. Adjoining to the kitchen there is a beautiful garden containing the sepulchres of Sultan Aider, Shah Tamas and several other Persian monarchs. There are immense revenues belonging to this astonishing edifice, which have been granted from time to time by many different emperors.

Very near this there is another tomb, erected to the memory of Seid Tzeibrail the father of Shah Sefi, who was only a peasant; it is of an oval form, raised ten steps, adorned with glass of several colours, and surrounded with iron grates; the roof is of azure gilt, and in the midst of it there is a large tower of blue and green stones; the floor is covered with rich tapestry, and round the walls there are vaults or chambers for the education of children; the tomb is six feet high, made of joiners work, and covered with green velvet; about it hang two gold and two silver lamps, in which there are lights every night; opposite to it is a small chapel which contains the tombs of many of Shah Sefi's family.

Near Derbent there are the ruins of a wall which extend 50 leagues in length, and the wall is said to have reached from the Caspian to the Euxine seas; and on one side of that city are above 6000 grave stones, most of which have Arabic inscriptions.

S E C T. VII.

Of Gombroon, the Islands of Ormus, Bahara and Quefimo, the Persian Gulph, the Caspian Sea, &c.

GOMBROON is in 27 deg. 40 m. north latitude. This city owes its opulence to the decline of the Portuguese power in the East Indies, and to the demolition of Ormus; it was built by the great Shah Abbas, and by the natives is called Bander-Abassi, or the court of Abbas; it is certainly a very great mart of trade: the English first settled here in 1631, and were very serviceable to the before mentioned monarch in his wars with the Portuguese; on which account he granted them half the customs of the port. The town is large and populous, but exceedingly inconvenient; a wall encompasses it on the land side, and towards the sea it is defended by several small forts, a castle, and a platform: though the town is rich, the houses are greatly

out of repair; the shops in general are kept by Banians, whose houses are in better order than those of any of the other inhabitants: some of them are stone edifices, but most are built of lime and earth. As the air during the hot seasons is of a very malignant nature, most houses are furnished with ventilators, which greatly contribute to the preservation of the health of the people. The town is well supplied with fish and mutton; rice is imported from India, but wheat is so plenty, that the poor subsist principally upon bread and dates; among the politer people pillau is the most fashionable dith. The country abounds in apricots, peaches, pomegranates, pears, plums, grapes, mangoes, and a great variety of other delicious fruits; the apricots are dangerous when eaten to excess.

A scarcity of water is severely felt here; there is not a spring or well in the town, nor within seven miles of it, for the inhabitants are obliged to be supplied from a place called Afsien, which is at about that distance; camels are constantly employed in bringing water from thence.

The unwholesomeness of the air is ascribed by captain Hamilton to the reflection of the rays of the sun from a high mountain to the north of the city; which occasions such an intense heat, that the situation is intolerable. On this account all who can afford it retire into the country during the months of June, July and August. The heat even affects the sea, and occasions very disagreeable exhalations to arise therefrom; these vapours, joined to the stench of a vast quantity of shell fish that are perfectly broiled on the sands every time the waves retire, occasion a kind of contagious influenza; gold and silver, if exposed to the open air during these months, tarnish in a very short time. As soon as ever these heats commence the English factory leave the city, and till they are over reside at Afsien, where they have a good house, and an excellent garden: in this garden there are several groves of excellent Seville oranges, which, though not natural to the climate, thrive admirably and are always in a state of verdure, bearing blossoms, and ripe and green fruit all at the same time. Many ponds of excellent fresh water contribute to the agreeableness of the place; and the merchants have many ingenious contrivances to moderate the excessive heat, and render their situation as pleasant as possible.

At a place called Minon, about ten miles distant from Afsien, are several hot and cold baths, which have been experienced as infallible in the cure of all scrophulous andumatic disorders.

Gombroon is exceedingly populous and rich, by reason of the fondness which the natives have for trade, and the great commerce carried on by the English and Dutch factories. The English factory is close to the sea, at some distance from the Dutch, which is a convenient, capacious, and elegant building. Great profits arise to both the companies from freightage; for as the natives have no ships, their goods are carried in English and Dutch bottoms to Surat, and other Indian marts. The principal commodities are, a variety of wines, almonds, raisins, kish-mishes, dates, prunellas, ginger, pistachio-nuts, silks, carpets, leather, lapis-tutty, galbanum, ammoniac, assafetida, tragacanth, with many other gums, drugs, &c. the principal of the above articles, being the produce of Carmania, are brought to Gombroon in caravans. The English company had once a small factory in Carmania, for the sake of a fine wood produced there, of excellent use to hatters. The companies pay no customs, but at certain times give presents to the shabander, or principal Persian officer, to prevent his being troublesome. Private traders pay two per cent. for a pass from either of the companies, that is, one to the company, and one to the broker. The pass admits them to the same privileges as the gentlemen of either factory enjoy. The English have an agent at Isfahan who receives one third of the company's profits, the chief at Gombroon one third, and the rest of the factors the other third.

There are three islands near Gombroon, viz. Ormus, Bahara and Quefimo. Ormus is about two leagues from the continent, and situated at the mouth of the Persian gulph. It is about twenty miles in circumference, but

eral are kept by Banians, than those of any of the em are stone edifices, but earth. 75

is totally barren, and has not a single drop of fresh water in it. This island produces some of the most excellent white salt in the universe, and great quantities of a black shining sand, which are transported to Europe, and used in dusting of writing. Among the fish caught upon the coast there are some admirable cyllers.

This city, which was large and populous, was erected by some of the ancient Persian monarchs, and contained about 4000 houses; but in 1507 the Portuguese took it, and held it till 1622, when they were expelled by Shah Abbas, assisted by the English, and the whole city was demolished by the express order of that monarch; no part of the island is at present inhabited except the fort, in which there is a Persian garrison.

The island of Bahara is remarkable for its pearl fishery, which commences in June, and concludes about the latter end of August; the annual profit is computed to be 110,000 crowns; the pearls being the largest, brightest, and most elegant of any found in the east.

Queimo is a fruitful, pleasant, and populous island, and supplies the neighbouring parts of the continent with wheat, barley, and other provisions.

The Persian gulph, or as it is otherwise called, the Gulph of Basora, flows out of the Indian ocean, having Persia on the east, and Arabia on the west. It receives into it the rivers Euphrates and Tigris, united in one stream. It was called by the ancients the Red Sea, and hath been long famous for its pearl fisheries.

The fishing for pearls is performed by persons, who are let down to the bottom of the sea in five fathom water, by means of a heavy stone fastened to their toes: when they reach the bottom, they pick up the shells with all possible expedition, and put them into baskets provided for that purpose; they then give a signal to be drawn up to take breath, and refresh themselves with a pipe of tobacco, while others pull up the baskets. All the pearls which weigh above ten grains are the property of the emperor, and severe penalties are inflicted upon those who embezzle them. The whole produce of the various pearl fisheries in the Persian gulph, Sir John Chardin says, amounts to above a million sterling annually.

The Caspian Sea, or as it is usually called, the great northern boundary of Persia, is surrounded on every side by land, having no visible communication with any other sea, and is therefore more properly an immense lake. The ancients knew it but very imperfectly, and even the moderns had not a competent knowledge of it, till Mr. Vanvarden surveyed and made an exact chart of it, by order of the Czar Peter the Great, in the years 1720, 1721, and 1722. It lies between the 37th and 48th deg. of north latitude, but its greatest longitude does not exceed 3 deg. 42 min. it receives into its bosom the vast river Volga, and above two hundred other rivers, and yet it neither ebbs nor flows, encreases, nor diminishes. Various conjectures have been formed concerning this constant plenitude; and many have asserted, that it must have some subterraneous communications either with the Black sea, or the Persian gulph, though the first is above 100, and the latter above 200 leagues distant. To strengthen this opinion, it is affirmed that opposite to Ailan in Persia are two immense whirlpools, which make a dreadful noise, turn with incredible rapidity, and draw down whatever comes within their vortex, which indicate that some great cavities in the earth must be near them. About the latter end of August great quantities of willow leaves are observed to float upon the waters of the Persian gulph, yet there are no willow trees on any part of its coast, but great numbers on the coast of the Caspian sea, which is another reason for supposing that there must be a subterraneous communication between them. The waters of the Caspian Sea are in general salt, but towards the places where the rivers discharge themselves into it they have a fresh taste. The equality of its fulness hath been thus philosophically accounted for. The vast quantity of vapours exhaled by the sun in a climate so intensely hot, is a counterbalance to the influx of waters, which is discharged into it by various rivers. Formerly none but Cossack rovers navigated it; but the Russians, who now possess a part of the coast, have many vessels on it, and carry on a great trade to various places.

A R A B I A.

S E C T. I.

Its Extent, Situation, Boundaries, and Divisions; its Soil and Climate; of the Antiquity of this Country; Religious Notions of the Arabs before the Time of Mohamed or Mahomet, with their Extent of Dominion after the Establishment of his Religion. Of the Seas, Capes, Rivers, and Mountains; particularly Mount Sinai and its Convent.

HAVING quitted Persia, we shall pass over the Persian Gulph to Arabia, a country equally famous in sacred and profane history: for here the queen of Sheba reigned, who formerly visited Solomon on account of his wisdom; Moses here received the levitical law; and Mahomet broached his heresy. The inhabitants were formerly accounted the most learned people in the universe, but at present they are justly deemed some of the most illiterate. From them the Europeans received many admirable arts and sciences, of the names of which the Arabians themselves are now ignorant. They have great natural talents, which they do not wish to improve; and a language famed for being equally copious, expressive, and elegant, which others admire and use more than themselves. One half of the people are the most

honest existing, and the other half the greatest thieves on the earth. The first are morally just by accident, and the latter are robbers by System. In one part of the country a stranger might sleep with a purse of gold in his hand on the open plain without losing it: in another, while wide awake he is in danger of having his throat cut every moment. Here are fewer towns than antiquities, less cultivation than objects of curiosity, and more wonders than waters. The face of the country includes all the various soils in the universe, the fertile and barren, the stony and sandy. There are few clouds in the element, but many on the land; for in the deserts such astonishing clouds of dust have sometimes been raised by the whirlwinds, that whole caravans have been overwhelmed, and thousands have perished by suffocation in those dreadful tempests; which Mr. Addison thus elegantly describes in his celebrated tragedy of Cato:

"Sudden, th' impetuous hurricanes descend,
"Wheel thro' the air, in circling eddies play,
"Tear up the sands, and sweep whole plains away;
"The helpless traveller with wild surprise,
"Sees the dry desert all around him rise,
"And smother'd in the dusty whirlwind dies."

But

But to enter upon particulars :

Arabia is one of the most extensive peninsulas in the known world ; it is one thousand three hundred miles long, and one thousand two hundred broad : it is situated between thirty-five and sixty degrees of eastern longitude, and between twelve and thirty degrees of northern latitude ; being bounded by Syria, Diarbee and Irac-Arabi, on the north ; by the Indian Ocean on the south ; by the Persian Gulph on the east ; and by the Red Sea, which separates it from Africa, on the west. It is divided usually into three parts, viz. Arabia the Stony, Arabia the Desert, and Arabia the Happy ; which distinct appellations denote the nature and quality of the soil of each country respectively.

Arabia the Stony, which is the most western, is the least of the three : it is a very barren country, being covered almost entirely with rocks ; its capital, Petraea, or Stony, stood on a rock ; and here is the famous mount Sinai or Horeb, as recorded in the sacred writings.

Arabia the Desert is a wild, sterile, mountainous, dreary, miserable country.

Arabia the Happy hath this flattering appellation, on account of the kindness of its own soil, in contrast to the barrenness of the other two countries. From hence the queen of Sheba went to hear the voice of Solomon ; and the Jews had a tradition that this princess brought with her the first branch of the tree of the precious balm of Gilead.

As to the climate, a considerable part of Arabia is under the torrid zone, and the tropic of cancer passes over Arabia the Happy : the air is intensely hot during the summer. These regions, however, enjoy a most serene and pure sky.

All histories agree that this country was peopled at a very early period. Dr. Wells says, the country took its name from its inhabitants, as being a mixed people, composed of Ishmaelites, Medianites, and Amalekites ; in support of which assertion he quotes the word Arab in scripture, which signifies in Hebrew, to mix or mingle. Another author says, "Arabia, or at least the most considerable part of it, was from remote antiquity called Arabak : we however find it frequently styled by their historians by divers other names ; but those bid the fairest for truth who deduce it from an Hebrew original, the word Arab or Erch having several significations very favourable to such a conjecture : from the word Arab naturally and easily flows Arabah ; and this notion seems less liable to exception, as Moses himself styles the western Arabia, Arabah ; which goes a good way towards evincing, that from its situation it received that name. Afterwards the Ishmaelites, who were possessed of it, gradually reducing the other parts, carried the word Arabah along with them, and applied it to the whole peninsula."

We cannot discover at what period their form of government commenced ; whether their knowledge was derived from India, or whether they acquired it themselves. It seems their religion was Sabeism even previous to their acquaintance with the people of Upper Asia : they had conceived some elevated notions of God at an early period ; they paid adoration to the stars, as luminaries enlivened and beautified by heavenly spirits ; and though they were enthusiasts, it does not appear they indulged in any particular fanaticism till the days of Mohammed or Mahomet, who established a new religion, and found it no difficult matter to infuse a spirit of zeal into his followers ; and this zeal led them on to conquest. They extended their dominion from the western seas to those of China, and from the Canaries to the Moluccas ; taking with them the useful arts, which they considerably improved.

The seas of Arabia are the Indian Ocean, the gulphs of Bosfora and Ormus, the Red Sea, and the straits of Babmandel, in which are the capes of Rosalgate, Mustleden, and Mocho.

The Red Sea, or the Arabian Gulph, which flows from the Indian Ocean, runs eastward as far as the isthmus of Africa, to the town of Suez. It has its name, according to some author, from an orient brightness peculiar to its waters, being tinged with a red mineral earth ; and it has a red sand on its shores, which is fre-

quently repugnant to its quality and nature, mixed with the water by the flux and reflux of the sea, which is so violent in this Gulph, as to toss it to and fro like ashes, and prevent its subsiding to the bottom by a perpetual vehement agitation. Seafaring people have confidently asserted, that the sand, thus borne and agitated by the turbulent waters, appears as red as blood, but that if put into still water, it will sink to the bottom.

Some writers have given it as their opinion, that its name is derived from the Greek word Erythros, signifying red, especially as Erythros was the name of a king who reigned on the coast.

We will not however dwell upon these adverse opinions, but attribute the derivation to both, and acknowledge, that from whatever its name be really derived, no sea has been more justly celebrated : the passage of the Israelites through it, and its conveyance of all the rich merchandize of the east for upwards of three thousand years, have given it an immortal fame.

As to the rivers of Arabia, they are very few, and none of them navigable ; the Chat, the Pran, and the Nagiran, are the only ones worth mentioning, and these are very small and shallow. The whole country is so poorly watered, that the possession of a spring is disputed with the sword.

The chief mountains are those of Sinai, Gebel el Ared, and St. Catharine ; the former of which deserves a particular description : it hath two summits, and is called by the Arabs the mountain of Moses, because many remarkable things happened here to that prophet. It was here, they say, that the Almighty appeared to him in the burning bush ; and the fathers shew a bramble, which they affirm is of the same kind. Here he likewise fed the flock of his father-in-law Jethro ; and not far off he struck the rock, out of which water instantly gushed ; the stone is of red granite, about fifteen feet long, ten broad, and twelve high : the opening does not resemble any thing done by a tool, and is somewhat like the mouth of a carved lion : into this aperture the Arabs put certain medicinal herbs, which they afterwards give to their camels, in case they are disordered, thinking them very salutary for any disease.

There is a convent at Mount Sinai founded by the empress Helena, and dedicated to the celebrated St. Catharine ; it stands at the bottom of the mountain, and is an irregular, awkward building, of unburnt brick, walled round, and stopped up at every entrance to prevent the incursions of the roving Arabs. The only free entrance is by a window that is upwards of thirty feet from the ground, and to which people are drawn up in a machine by a windlass. Within the walls, which are two hundred and fifty-five feet long from east to west, and fifty-five broad from north to south, are mills, bake-houses, store-houses, and every office necessary to a sequestered society. Here is the shrine of St. Catharine ; the relics are deposited in a marble chest, whereon are carved several pieces of foliage in basio relievo. One of that saint's hands is shewn to the curious, the fingers of which are covered with rings, adorned with pearl. Adjoining to the east end of the church, wherein these relics are preserved, is the chapel of the Holy Bush, which the monks assert grew in the same spot whereon now lies a flag of white marble, which Christians approach and most devoutly kiss ; nor will they enter this chapel with their shoes on. There are many other chapels about the convent. Here are two wells ; one is called the well of Moses, which hath a very fine cool water, and is drank in summer ; the other is called the well of the Holy Bush, and is of a warmer temperature. St. Athanasius was a brother of this monastery, as was Sergius, who assisted Mohamed in writing the Koran. This convent is exempted from all jurisdiction, except that of its own bishop, who is elected by the monks, and receives his confirmation from the Patriarch of Jerusalem. The monks here live in the most abstemious manner, and in Lent rise at midnight to perform their devotions. The emperor Justinian sent an hundred families from the Red Sea, and the same number from Egypt, to serve them as vassals : at that time they were pretty numerous, but now consist only of about forty or fifty, owing to disputes among themselves, which cost several of them their

their lives. Their vassals cultivate their gardens, and do other menial offices. A lay-brother, or caloyer, is appointed to attend upon strangers arriving here, to show them the chapels, offices, and the library, in which are deposited some of the first Greek books that were ever printed. The feet of pilgrims, on their arrival here, are washed by the lay-brothers; and those of a priest by one of equal rank in the church. Dr. Pococke, bishop of Osiery, had the satisfaction of being present at all their Easter ceremonies. The church containing the relics of St. Catharine, is called the great church of the transfiguration; it lies to the north east, on the lowest part of the convent, and consists of a nave, an isle on each side, and three chapels on the outside, lower than the isles. The pictures of Justinian, and his empress Theodora, over the arch of the high altar are well executed in mosaic; and several inscriptions to the honour of that illustrious pair are carved on the beams that support the roof, which is of cyprus covered with lead, and is very antique. The Turks destroyed the pavement of this church, digging it up in hopes of discovering treasures; but it was elegantly repaired by archbishop Athanasius in the last century.

Mount St. Catharine is situated near mount Sinai; and it was to the former place that the body of St. Catharine was brought, after her martyrdom under the tyrant Maxentius. It over-tops mount Sinai, and its soil is a species of speckled marble, in which are seen beautiful configurations of trees, and other vegetable representations.

S E C T. II.

Of the vegetable Produce of Arabia; of the Animals, particularly the Camel.

THE most profitable produce of Arabia is coffee. The coffee-tree is a native of the territory of Betel-sagui, a town belonging to Yemen, situated on a dry sand at the distance of about ten leagues from the Red Sea. It is cultivated in a district fifty leagues long, and about twenty broad; the fruit is not every where in equal proportion; that growing on high ground is the smallest, greenest, and best.

Here are aloes, cassia, spikenard, frankincense, myrrh, manna, and other valuable gums, cinnamon, pepper, cardamum, oranges, lemons, grapes, peaches, figs and pomegranates; also honey and wax in plenty: and in the seas are considerable quantities of the best coral and pearls.

In the plains of Arabia Petræa there are abundance of Acacia trees, from which issues a very valuable gum, and is gathered in autumn. Here are however very few forest trees.

The principal grain here is rice and barley, and where they can obtain water, they have a great plenty of garden stuff, herbs, and flowers. Some of the districts also afford excellent pasture for cattle.

With respect to the animal creation, here are the finest horses in the whole world, whether considered for their swiftness, their beauty, or their sagacity. Here are sheep, cows, oxen, mules, goats, hogs, dogs, &c. But the most esteemed and useful animal is the camel, which can carry even or eight hundred weight upon its back, and with this burthen will travel at the rate of about two miles and a half in an hour: it is therefore the beast of burthen most in use, and is peculiarly serviceable in long and tedious journeys, which are commonly performed in caravans, escorted by guards, to prevent the depredations of the Arabian free-booters. This creature is the most patient and temperate of the whole quadrupedal creation; it will travel for many days together with only a few dates, or some balls of bean or barley meal, or perhaps only the miserable thorny plants it meets with in the sandy deserts, where not a drop of water is to be met with during perhaps a journey of eight or ten days; where neither birds nor insects are to be seen; in short, where nothing presents itself to the eye but mountains of sand and heaps of bones. This animal's power of sustaining abstinence from drinking, arises from the construction of its internal parts; so that it should seem Divine Providence had created it purposely for the sultry soil of Arabia. Besides the four stomachs, which it has in common with all other ani-

mals that chew the cud, it has a fifth, serving as a reservoir to hold more water than it has an immediate occasion for: there the fluid remains without corrupting, or without being adulterated by other aliments. When the creature is thirsty, it throws up a quantity of this water, by a contraction of the muscles, into the other stomachs, which serves to macerate its dry and simple food. It can, by its scent, discover water at the distance of half a league, and, after a very long abstinence, will hasten towards it.

The Arab trains his faithful camel, from its birth, to all the hardships it is to undergo during the whole course of its life; he accustoms it to travel far, and eat little; to pass its days without drinking, and its nights without sleep; to kneel down to be loaded, and to rise the moment it finds the burthen equal to its strength; and indeed it will not suffer an ounce more to be put on its back than it can bear. Its feet are adapted to the sands which it is to pass over, their toughness and spongy softness preventing them from cracking.

Such is the animal so often celebrated in the bible, the koran, and the eastern romances; and with which the Arabian robber forms a society, for the purpose of carrying on his trade of plunder, in which the man is to have all the profit, and the animal all the fatigue.

When the master and his camel are equipped for plunder, they set out together, traverse the sandy deserts, and lie in ambush upon the confines to rob the merchant or traveller. The man ravages, massacres, and seizes the prey; and the camel carries the booty.

The Arabian free-booter qualifies his camel for expedition, by matches, in which the horse runs against him. The camel, though less active and nimble, tires out his rival in a long course.

The banditti frequently rob on horse-back, as well as on camels; they will alarm and dart upon a traveller when least expected, and gallop away, if under any apprehension of a pursuit, with incredible swiftness.

S E C T. III.

Of the Natives; their Persons, Dress, Customs, and Manners; their Roving about from Place to Place; their Movable Habitations; their Government; their Food, and their Manner of Dressing it; their Sociability, Probity, and Liberality, within their Tents or Huts; their Rapacious Depredations upon those of them; their Diversions, particularly the Hunting the Wild Boar and the Lion. Slight Remark upon the Jealousy of the Arabs, and their Unmanly Treatment of Women.

THE Arabians are of low stature, slender bodies, and swarthy complexions: their voices are shrill and effeminate; their hair is of a dark brown, and their eyes are black and sparkling: they wear long beards, as a mark of gravity and consequence; serious and reserved, they speak little, use no gesture, make no pauses, and never interrupt each other. Their apparel is a loose disorderly kind of dress, five or six yards long, and not less broad; this they wrap round them, and are forced to gird it with a sash; at night it serves them for a bed and coverlid. Their upper garment is generally wove in one piece; it has a cap for the head, is tight about the neck, and grows wide towards the bottom: this garment is only worn in cold and rainy weather; under this, and the garb that wraps entirely over the whole, some of them wear a long close bodied waistcoat without sleeves; their sash or girdle is of worsted, and in it they stick their poinards, their inkhorns, or badges of their calling. The women wear a kind of short waistcoat and drawers, but sometimes they have only a towel wrapped round their loins. Whenever they go out, they to cover themselves with the same kind of general inclosing garb as worn by the men, that there is very little to be seen of their faces: for jealousy, that constant disturber of unguarded and impetuous minds, here plays the tyrant in the breasts of the male Arabs. Some of the men go almost naked in the hot weather; others wear drawers and slippers, but no stockings.

These people are distributed into several clans; and the whole number of inhabitants are supposed to amount to about two millions. They have (at least the Bedouins

or roving Arabs) no settled place of abode, but fix at such places as supply them with water, pasture, and fruits, subsisting upon the flesh or milk of their herds and cattle.

In this roving life centers all their happiness; and they look upon their more settled countrymen as abject slaves. They sleep in tents or huts, which they pitch in the evening in any spot prescribed either by fancy or convenience. These moveable habitations, which are called *Ihymas*, from the shade they afford the natives, are of an oblong form, and differ in size according to the number of the people who occupy them; they are covered with the skins of beasts, and supported some by one pillar, some by two, and others by three, whilst a sort of curtain or carpet, made of skins, divides the tent into separate apartments. The pillars are straight poles eight or ten feet high, and four or five inches thick, serving not only to support the tent, but being full of hooks, the natives hang upon them their cloaths, baskets, saddles, &c. When they retire to sleep, they lay themselves down upon a mat or carpet in the center or in a corner of the tent. Such as are married have a corner of the tent divided off by a curtain.

However, the tents of these roving inlanders, though they may shelter them from the weather, are, notwithstanding, attended with their inconveniences; for the cold and the dews, to which the people are exposed, do not incommode half so much as the fleas, vipers, spiders, and scorpions.

As to the government of these people, an hereditary chief, assisted by a few old men, determines all debates, and punishes offenders. If his conduct proves worthy of the approbation of his people, they revere him: if he be guilty of mal-administration, they put an end to his existence, and elect another of his family in his room. These petty princes are styled *Xerifs* and *Imans*, both of them including the offices of king and priest.

What these people consume in coffee, dates, rice, and tobacco, is bought with the butter they take to the frontiers, and with the cash they get by the yearly disposal of not less than twenty thousand camels, many of which are sent to Persia.

These people retain several of the customs and manners we read of in sacred as well as prophane history; being, if we except their religion, the same people they were two or three thousand years ago. Upon meeting one another, they still use the primitive salutation of, "Peace be unto you." Before the Mahometan conquests, the expression was, "God prolong your life." The inferiors, out of respect and deference, kiss the feet, knees, or garments of their superiors; whilst children and other kindred pay the same respect to parents and relations. The posture they observe in giving one another the salute, or *assalah*, is laying the right hand upon the breast; while others, who are perhaps more intimately acquainted, or of equal age and dignity, mutually kiss the hand, head, or shoulder of each other.

At the feast of their *Byram*, and other great solemnities, the wife compliments her husband by kissing his hand.

It is no disgrace here for people of the highest characters to buy themselves even in the most menial offices; nor is the greatest prince or chief of these countries ashamed, to turn a drover or butcher, by bringing a lamb from his herd and killing it; whilst his lady or princess makes a fire and puts on a kettle to dress it.

As to the food of these people, they eat rice, and any kind of flesh, except that of the hog; but have always the blood drained carefully from every vein of the animal they kill. Their most delicious food is the flesh of a young camel; and, for their bread, they make thin cakes of flour, which they bake upon a hearth.

They dress their victuals, by digging holes in the earth, and then making a fire with whatever fuel they can get, or with the dried dung of their camels; they carry their water with them, loading their camels with that necessary article.

The wandering Arabs pique themselves on observing the strictest probity towards one another, and maintain the character of humane, disinterested, and beneficent

hosts, in their tents; but, out of them, they are savage and rapacious, committing continual depredations in the different towns and villages. If they are pursued, they mount each a camel or horse, and make a precipitate retreat, driving a whole troop or rather herd of camels before them, loaded with plunder.

They frequently carry their incursions to a great distance; and Syria, Mesopotamia, Persia, and other parts, are not uncommonly the scenes of their depredations. Mr. Ives in his travels from Diarbekir, in 1756, particularly says, "To-day we joined a nation of wandering Arabs, with their families, and numerous flocks; the latter consisted of the finest sheep and most hairy goats I ever remember to have seen. We wanted to buy some of them, but could not succeed. The Arabs were just come from the Armenian mountains." The same gentleman says, "The Arabs are divided into tribes; and, out of as many of these as possible, it is advisable, in crossing the deserts, to select men; for no tribe, of whom you have a single man, will hurt or molest you. Or if you meet with any of their scouting parties, and can prevail with a single one to enter their tent and drink coffee, or eat rice or any thing, you will then be safe from any insult, either from them or their brethren, it being an inviolable maxim with them never to molest those strangers they have eaten and drank with. Should any out-party come up with you, and hang back to their main body to communicate the intelligence; even in that case, if one of your men can make greater haste, and throw himself at the feet of their *Xerif* or prince, and implore protection, you may rest assured of your life and property; for another maxim with them is, that whosoever shall fly to the powerful, and supplicate assistance, has a right to receive it."

The custom which still continues of walking only in sandals, or barfooted, requires the ancient compliments of bringing water to a stranger, upon his arrival, to wash his feet, though water be so precious an article with them. The person who presents himself to do this office, and to give the welcome, is the master of the tent and family, who distinguishes himself by being the most officious; and who, after his entertainment is prepared, does not sit down with the stranger, but stands up and waits upon him.

When strangers are thus courteously treated, the host thinks himself sufficiently requited, if presented with a knife, a couple of flints, or a small quantity of European gun-powder, which being much stronger than that of Arabia, is held in greater esteem, and used only for priming fire-arms. As to the hostess, she thinks herself well rewarded with a skean of thread, a large needle, or a pair of scissors.

The following is an account given of the reception which some European merchants met with from a tribe of Arabs, wandering from country to country. "This extensive encampment of roving Arabs, says the author, was under the command of a prince, whose tent was in the center; the rest were pitched about it, not in a circular form, but extending in length as the plain opened, for the convenience of a stream that flowed through the encampment. As soon as the merchants were alighted, who had previously sent before them some native Arabs, they were conducted by some of the prince's chief people to a larger tent pitched next to his own, and the prince then visited them, giving them a hearty welcome. In the evening a supper was provided, consisting of a dish of pilau or boiled rice, and several dishes of meat exclusively. Next day a grand entertainment was given by one of the prince's nobles, at which his highness attended, as did the merchants. The dinner, which consisted of two young camels, a dish of camel's bones and soup, and several dishes of rice dressed various ways, was conducted with tolerable decorum, though there were neither knives, forks, nor spoons; fingers alone were the instruments made use of."

The life of an Arabian is one continued round of idleness or diversion; when no pastime calls him abroad, he loiters in his tent, smokes his pipe, or stretches himself under the shade of some tree. He has no relish for domestic pleasure, and seldom converses with his wife or children: he values nothing so much as his horse, being seldom

of them, they are savage continual depredations in. If they are pursued, or, and make a precipitous troop or rather herd or plunder.

incursions to a great tania, Persia, and other the scenes of their depredations from Diarbekir, in day we joined a nation families, and numerous the finest sheep and most have seen. We wanted could not succeed. The Armenian mountains."

"The Arabs are divided many of these as possible, the desert, to select men, a single man, will hurt with any of their scouting a single one to enter their or any thing, you will either from them or their maxim with them never have eaten and drank with, with you, and hang back to the intelligence; even can make greater haile, of their Xenil or prince, may rest assured of your maxim with them is, powerful, and supplicate it."

treacherously treated, the host, if presented with a small quantity of European much stronger than after esteem, and used only to the hostess, she thinks of thread, a large

given of the reception, its met with from a tribe entry to country. "This Arab, says the author, prince, whose tent was pitched about it, not in a in length as the plain of a stream that flowed as soon as the merchants violently sent before them conducted by some of the ger tent pitched next to visited them, giving them a supper was propitius or boiled rice, and rely. Next day a grand of the prince's nobles, as, as did the merchants, of two young camels, a tip, and several d. then of conducted with tolerable either knives, forks, nor instruments made use of." one continued round of pastime calls him abroad, his pipe, or stretches himself. He has no relish for converse with his wife or much as his horse, being seldom

seldom so well pleased as when he is hunting: and in this diversion they are excellent; for most of them will hunt down a wild boar with astonishing expedition. We find upon one of the medallions of Constantine's arch a very beautiful representation of this sport, as performed at the present time by the natives of Arabia; who, after they have routed the boar from its place of retirement into some neighbouring plain, endeavour there, by frequent overtaking and turning, to tire and perplex it; then watching a proper opportunity, either transfix it with their lances from some distance, or else, coming close by its side, fix their spears in its body.

At the hunting of the lion, great numbers of the natives assemble; who, forming themselves into a circle, inclose a large space of ground, of three, four, or five miles compais; then the people on foot advancing first, rush into the thickets with their dogs and spears, to rouse the game; whilst the horsemen, keeping a little behind, are always ready to charge upon the first fall of the beast. In this manner they proceed, still contracting their circle, till they at last either close together, or meet with game to divert them.

The accidental pastime, upon these occasions, is sometimes very great; for the several different sorts of animals, such as hyenas, hares, jackalls, &c. that happen to lie within the compais, being driven together, afford a variety of excellent diversion.

The first person against whom the lion flies, receives him on his spear, which furnishes the others with an opportunity of attacking him behind; the lion finding himself wounded in the rear, turns that way, which gives the first man time to recover. Thus he is attacked on all sides, till, at last, they disfile and dispatch him.

The eyes of a lion are always bright and fiery, and he retains this aspect of terror even in death.

The roaring of the lion, when heard in the night, and re-echoed by the hills, resembles distant thunder: this roar is his natural voice: his cry of anger being a different growl, which is short, broken, and reiterated: his cry of anger is also much louder and more formidable. He then lashes his sides with his long tail, and his mane seems to stand like bristles round his head; the muscles of his face are greatly agitated, and his huge eye-brows cover a great part of his glaring eye-balls. It however appears from various accounts that the indignation of this animal is noble, his courage magnanimous, and his disposition grateful: his courage is tempered with mercy, and he has been known to spare the weaker animals, as if they were beneath his attention.

The Arabs affect to harbour a notion that the lion spares the tender sex. This animal was consecrated to Vulcan in Egypt, on account of its fiery constitution. The poets yoke two lions to the chariot of Cybele, as appears by several medals: the effigy of this animal was also carried to the sacrifices of that goddess; because the galls, her priests, had discovered the secret of softening and even taming lions, to such a point as to touch and caress them without fear, according to Varro. The Leontines adored the lion, and stamped its head on their coins.

Fowling is a favourite diversion of the Arabs: they do not spring the game with dogs, but shade themselves with a piece of cloth painted, stretched upon two reeds, and walk thus covered through the several breaks and avenues, where they expect to find game. In this painted cloth are several holes for the fowler to look through, in order to observe what passes before him. The sportsman, on sight of game, rests his shade upon the ground, and directs the muzzle of his gun through one of the holes, and thus discharges it.

It has been observed, that the ruling passion of the Arabs is jealousy. The married as well as unmarried women, are subjected to an outrage on the virtue of their sex, which delicacy forbids us here to mention.

It is said to be from the Arabians that several nations of Asia, Africa, and even Europe itself, have borrowed those contemptible precautions which jealousy prescribes against a sex that ought to be the guardian and not the slave of our pleasures. Polygamy is allowed, though with certain limitations; and divorce is also permitted.

The civility and respect shewn to the tender sex, in some of the more refined nations of Europe, are here looked upon as extravagancies, and so many infringements of that law of nature which assigns to man the pre-eminence.

S E C T. IV.

Of the original Introduction and present State of the Sciences in Arabia; of some pretended wife Men, and the Impostors who practise Sorcery; of the Language, both the corrupt and pure Arabic. Of the Commerce of the more settled Inhabitants.

WHEN the power of the Caliphs was manifestly on the decline, the Arabs, after the example of several nations they had subdued, threw off the yoke of these princes, and the country gradually resumed its ancient mode of government, as well as its primitive manners. At this period, the nation being, as originally, separated into tribes, under the controul of different chiefs, returned to their original character, from which ambition and fanaticism had caused them to recede. They introduced into the countries, which they had conquered, sciences which they had pillaged, as it were, in the course of their ravages, and all the arts essential to the welfare of a people. An able writer, treating on this subject, says, "With regard to the sciences, it must be confessed that the Arabians made a most amazing progress therein: it was however late ere they began to cultivate them, though the fire and vivacity of their genius rendered them very apt for the purpose. The truth is, the first Caliphs were utterly ignorant of every thing except the koran and the art of war; but under the government of the descendants of Abbas, a taste for the sciences prevailed throughout the whole nation, and men of learning appeared on every side, who being favoured and protected by the princes, were improving arts and sciences, and compounding works in different kinds of literature." And the Abbe de Fleury says, "Those Arabians, I mean all such as called themselves Mussulmen, followed two kinds of study; one, which was proper to them, and another which they borrowed from the Greeks. Their proper study was in the first place religion, that is, the koran; the traditions which they attributed to Mahomet and his first disciples; the lives of their pretended saints, and the fables they related of them; cases of conscience touching the practice of their religion, as prayer, purifications, fasts, pilgrimages, and their school divinity. Others treated the koran and its commentaries rather as lawyers than divines, namely, to furnish themselves with precedents for determining their differences and disputes; for that book is their only law, even in matters temporal. Others again applied themselves to the study of their history, which had been carefully written, from the commencement of their religion and empire, and continued down from time to time: but they had not the least knowledge of any history more ancient than their own government, despising all mankind who were before Mahomet, and calling all those days the days of ignorance, because they did not know their religion. They were contented with the antiquity of their countrymen, as contained in the works of their ancient poets, which served them for an history of those times: in which it cannot be denied they followed the same principle with the ancient Greeks, of cultivating their own traditions, however fabulous they might be. But it must also be acknowledged that the beauties of their poetry were ever merely superficial, consisting only of liveliness of fancy and boldness of expression; they did not apply themselves to that kind of poetry which is best calculated to move the passions. Their poets were useful in the study of the Arabian tongue, which was then the language of the literati, and of most part of the people in that great empire." The same learned author further says, "The study of medicine, among other things, was not forgotten by the Arabians; but they grounded it chiefly upon general reasons touching the four qualities or accidents, the constitution of the four humours, and upon some traditional remedies which they had not taken the trouble to examine, and which they blended with a heap of superstitious nostrums. As to anatomy,

which

which came to them in a very imperfect condition from the Greeks, they made no progress in it. It is however certain we are obliged to them for chymistry, in which they made very great improvements, if they were not the inventors of it: but they also mixed with it those defects which we find so much difficulty to separate from it, even at this time, viz. delusive arguments, superstitious operations, and whatever else has furnished out the whole race of quacks and impostors. From thence they fell easily into magic and all kinds of divination, which mankind naturally follow who are not acquainted with physics, history, and true religion, as may appear from the example of the ancient Greeks. Astrology, which was the chief aim of their mathematical studies, was in such high esteem under the Mussulman empire, that princes made it their chief study, and by its directions regulated their most important enterprizes. With respect to astronomy, they were masters of the same advantages that had exerted the ancient Egyptians and the Chaldeans to prosecute that study, and were acquainted likewise with all the observations made by those seniors, as also with all the additions the Greeks had made to them. We are indebted to the Arabians for algebra, as also the nine digits and the cypher, which hath so greatly facilitated arithmetical operations."

The sciences in Arabia at present are at a very low ebb, the Arabs afford no monument of genius, no productions of industry, that entitle them to any rank in the history of the human mind. Physics, philosophy, astronomy, and the mathematics, for which they were once famous, are so lost to them, that scarcely the traces of them are remaining: we, however, must say that the present Arabs have strong intellects, and that nature has in general given them a genius; but application and inclination are both wanting to improve it.

To remove a disorder, they frequently use charms and incantations, or leave it to contend with nature. They pour hot fresh butter into simple and gun-shot wounds, and this remedy sometimes succeeds: an application of the prickly pear, roasted in ashes, is good in suppurations.

Time is in these countries measured by hour-glasses; and in some parts of Arabia Petraea, they have calendars that were left them by their ancestors, which are rather curious, and in which the sun's place, the semi-diurnal and nocturnal arch, the length of the twilight, and the hours of prayer, are inserted in their proper columns, and calculated to a moment.

They know nothing of algebra, or numerical arithmetic, though their ancestors furnished us with the characters of the one, and with the name at least of the other; yet they have a way of reckoning, by putting their hands into each other's sleeves, and touching one another with a certain joint or finger so expressively, that without even moving their lips, they can conclude bargains or agreements.

There are some wise men, however, amongst them, who, if you believe them, are so skilled in figures as to be able, by certain combinations of numbers, to form even the most wonderful calculations.

Here too are some famous fire-eaters and breast-thumpers, who both pretend to foreery; the former put burning wadding and such sort of stuff into their mouths, and the latter strike their breasts with large iron pins; and yet neither of them receive any damage from these astonishing feats.

The language of these people is Arabick, a very corrupt Arabic. The pure Arabic is only understood by some of the settled natives on the sea-coasts, and is taught in the schools, as well as used in places of worship.

We shall now quit these inland rovers for a while, and treat of the commercial connections of the more settled inhabitants.

It has been already observed, that the coffee-tree is cultivated at Betel-fagui. None but rich citizens have the satisfaction of tasting the berry itself. The commonality must be contented with the husk, which however makes a liquor of a very agreeable taste. At Betel-fagui is sold all the coffee that comes out of the country by land; the rest is carried to Mocha at the distance of

more than thirty leagues, or else to Lohia or Hodeida, which are nearer, and from whence it is transported to Iodda in small vessels. The Egyptians fetch it from the last-mentioned place, and all other nations from the former. The quantity of coffee exported may be estimated at twelve millions five hundred and fifty thousand weight. The European companies take off a million and a half; the Persians three millions and a half; the Suez fleet six millions and a half; Indostan, the Maldives, and the Arabian colonies on the coast of Africa, fifty thousand; and the caravans a million. The coffee bought up by the Europeans and caravans, is the best that can be procured. And here we cannot omit to mention, that the roving Arabs raise a contribution on the caravans; those which travel from Damar to Mecca, procure an uninterrupted journey for the consideration of an hundred and fifty thousand livres, to which the Grand Seigneur is subjected.

Mocha is supplied by Abyssinia with musk, sheep, elephants teeth, and slaves; by the eastern coast of Africa with gold, amber, ivory, and slaves; by the Persian Gulph with corn and tobacco; by Surat with linens; by Pondicherry and Bombay with copper, lead, and iron, carried thither from Europe; and by Malabar with rice, ginger, and other articles. None of these branches of trade, however, thus carried on at Mocha, can be said to be under the management of the natives; the warehouses are occupied and managed by the Banians of Surat or Guzarat.

To the port of Iodda (which is situated near the center of the Gulph of Arabia, about twenty leagues from Mecca, and where the Grand Seigneur and the Xeriff of Mecca share the authority and revenues between them) Surat sends annually three ships, laden with silks, cotton, linens, and shawls; and the English at Bengal associated with the Armenians, send three ships also annually to the same port, laden with linens and a variety of other articles.

S E C T. V.

Of the Religion of the Arabs, of the Practices and Impostures of the Marabats; of the extreme Arabian Fanaticism on the Death of Mahomet or Mahomed; of the four fundamental Points of Religion required by the Koran; of the Purifications and other Religious Ceremonies. Of the solemn Pilgrimage to the Temple of Mecca, with a Description of the grand Caaba, and the Ceremonies of the Pilgrims.

WE have already observed, in the first section of the present chapter, that the ancient religion of the Arabs was Sabæism; that they had formed some sublime conceptions of the Godhead, and that they worshipped the heavenly constellations; though indeed it should at the same time have been remarked, that there was also at that period a religion in Arabia Deserta not quite so rational, nor so free from cruelty as the former, for this consisted in the offering of human sacrifices to the sun; and perhaps we may be justified in our idea, when we presume to think, that religious professions in general are more or less tinged with cruelty, in proportion to the milder or ruder climate of the country in which they are exercised.

Dr. Wells observes, "Christianity was practised here (Arabia) by St. Paul and his disciples; so that it received the light of the gospel very early; but, in many parts of it, it was much clouded, if not totally eclipsed, long before the grand impostor, Mahomet, their countryman, made his appearance; and upon their being subdued by the Turks, they embraced his religion. But, in more ancient days, they were all idolaters: hence Alexander the Great took it into his head to attempt the conquest of them, that he might be worshipped by them as a deity, for though great numbers of them had an exalted idea of one all-ruling omniscient and omnipresent Being, yet many had other deities."

Herodotus says, "some acknowledged two deities, Bacchus and the celestial Venus; the former they styled Urotalt, and the latter Alilat." "Hence, says another author, the victorious Alexander wished to conquer them, that he might be their third deity. But death put a stop to his aspiring views."

life to Lohia or Hodeida, hence it is transported to Egyptians fetch it from the nations from the former. It may be estimated at fifty thousand weight, off a million and a half; a half; the Suez fleet fix, the Maldives, and the of Africa, fifty thousand; the coffee bought up by the best that can be procured to mention, that the on the caravans; those Mecca, procure an un- consideration of an hundred which the Grand Seigneur

ASIA.]

A R A B I A.

They are accused by some authors of having wor- shipped the two golden antelopes so often mentioned in their histories, and which were at length presented to the Temple of Mecca. " However that be, says one writer, the Arabs are divided into Gentile and Mussulman. The former are stiled Arabs of the times of ignorance, and the other the faithful and true believers; for that is the meaning of the word Moslemman, which we commonly, though erroneously write Mussulman."

Many of the modern Arabs carry about with them a paragraph of the Koran, which they place upon their breasts, or sew under their caps, to prevent fascination; so addicted are they to superstition.

They have a great veneration for the Marabbats, who are deemed saints, and are persons of a rigid and austere life, continually employing themselves either in counting over their beads, or else in prayer and meditation.

The above faithfulness goes by succession, and the son is entitled to the same reverence as the father, provided he can keep up an equal gravity and decorum. Some of them have the reputation of being blessed with heavenly visions, and conversing with the Godhead; while others, who are supposed to work miracles, pretend they are endowed with gifts which Mahomet durst not pre- tend to.

Such is the fatal progress and success of practices introduced and supported by imposture; and thus is the human reason perverted by absurd prejudices: for as soon as an error in religion becomes general, it becomes also the basis of an entire system of worship and morality.

Can we read un-agitated, or can we contemplate un- moved, the fanaticism of those wretched Arabs, who, on the death of their memorable impostor, ran frantic into the streets of Medina, crying out, "Where is our mediator and saviour? Where is the divine Mahomet? Where is our great apostle? How! Can he be dead? Impossible! He is not dead, but only gone for a while, as Moses, the son of Amran, was gone from the people of Israel forty days, and then returned to them."

So infuriated were these people, that they would not suffer the dead body of the impostor to be interred, till Abubeker, the succeeding Caliph, produced several passages from the Koran, convincing the deluded multitude that according to the nature of things Mahomet must be really and absolutely dead.

The four fundamental points of religious practice required by the Koran, are prayer, giving of alms, fast- ing, and the making a pilgrimage to Mecca. Under prayer are comprehended those legal washings and pu- rifications which are preparatory thereto; of which there are two degrees, one called Ghost, being a total im- mersion of the body in water; and the other Wudi, which is the washing of their faces, hands, and feet. The first is required in some extraordinary cases only; the other is the ordinary ablution in common cases, and before prayer, and must necessarily be used by every person before he can enter upon that duty. Some of the Mussulmen pretend that these purifications were observed in the days of Abraham, who, they add, was enjoined by God to practise them, and was shewed the manner of making the ablution by the angel Gabriel, in the form of a beautiful youth. Others carry the custom still higher, and say their religious ceremonies were taught our first parents by the angels.

Besides these washings, there is another purification, performed by defecation, and which is enjoined in the fifth chapter of the Koran. It is called Al Tayamon, denoting properly the action of taking any thing from the surface, as fine sand from the earth's surface; whence the parts of the body are sometimes rubbed with fine sand, instead of being washed with water. The words of the Koran are, "If ye be sick, or on a journey; or if ye have touched women, and ye find no water, take fine clean sand, and rub yourselves therewith."

Besides these purifying ceremonies, there is the cere- mony of circumcision; which, though not directly re- quired in the Koran, is yet held by the Mahometans to have been originally of divine institution, and is exer- cised on children as soon as they are able to pronounce the profession of their faith.

It is a maxim, too, with the Mussulmen, that as comb- ing the hair, paring the nails, and plucking out the hairs of the arm-pits, are all points of cleanliness, they are essentially necessary to internal purification; and these therefore are looked upon as indispensable duties.

Every strict and conscientious Mussulman performs public prayer five times a day, in consequence of the di- vine command pretended to have been given to Ma- homet for that purpose: this he does either in a mosque, or in some other place that is clean, after a prescribed form, and with a certain number of praises or ca- lulations.

The Mussulmen of Mecca, when in a mosque, must, when they pray, turn their faces towards the temple of Mecca.

The Mahometans (or Mahomedans) do not attend divine service in elegant apparel, but dress themselves only with a becoming and consistent decency.

Some of the Mahometans will not suffer their women to attend the mosque; and the illiterate think that the female sex have no claim to the joys of heaven, as having no souls to be saved; but the more enlightened, gene- rous, and candid, allow that women are as well entitled to heaven as the men: and, according to an able writer, many Mahometans think that there is a mansion in heaven set apart entirely for the souls of good women.

The Mahometans are for the most part predestina- rians; for one article of faith in the Koran is God's ab- solute decree and predestination of both good and evil; that whatever hath or shall come to pass, whether good or bad, proceeded and will proceed from the divine will alone: a sect called the Motazalites, however, contra- dicted this doctrine, and maintained that God could not be the author of evil, and that man was a free agent.

Of the abovementioned article in the Koran, the impostor Mahomet made a very political use, espe- cially at the battle of Ohod, in which he was repulsed by the Coraishites. He calmed the minds of his party, after their defeat, by representing to them, that the time of every man's death is decreed and predetermined by God; and that, therefore, those who fell in the battle of Ohod, could not possibly have lived, had they staid at home: for the inevitable hour of their dissolution was arrived.

There is annually a most numerous and solemn pil- grimage of the Mahometans to the Masjid-Al-Haran, or Sacred Temple of Mecca; which pilgrimage was instituted by Mahomet.

To this holy temple, in the ancient city of Mecca, a prodigious concourse resort. The temple stands in the center of the town, and hath a famous Caaba, or square structure, peculiarly hallowed and set apart for worship: its door is of silver, and a golden spout carries off the water from the roof. This Caaba, from north to south, is twenty-four cubits long; twenty-three broad, from east to west; and its height is twenty-seven cubits. The silver door, which is on the east-side, stands about four cubits from the ground, and is ascended to by a flight of steps. In the corner next to this door is a famous black stone, said to have been brought down from heaven by Gabriel, at the creation of the world, and which was originally white, but contracted the blackness that now appears on it from the sins of man- kind. On the north-side of the Caaba, within a semi- circular inclosure fifty cubits in length, stands a cele- brated white stone, said to be the sepulchre of Ishmael, which reserves the water that falls from the golden spout. The Caaba has a double roof, supported within by the octangular pillars of aloes wood; between which, on iron bars, hang silver lamps: the outside is covered with rich black damask, adorned with an embroidered band of gold, which is changed every year, being pro- vided by the Grand Seigneur. At a small distance from the Caaba, on the east-side, is the station or place of Abraham, where is another stone that is in high esteem with the Mahometans, and on which they pretend to show his footsteps, asserting that he stood on this stone when he built the Caaba. At a small distance also the Caaba is neatly surrounded by pillars, joined towards the bot- tom by a low balustrade, and towards the top by silver bars. Just without this inclosure, on the south, north,

and west sides of the Caaba, are three buildings, in which three particular sects assemble to perform their devotions. Towards the south-east is an edifice covering the famous well Zemzem; also the treasury, and the cupola of Al-Abbas. But here we must not omit to observe, that this celebrated well is said to have been the same that Hagar sat near to when comforted by the angel; the pilgrims drink of its water, and attribute many virtues to it. At some distance the whole of these buildings we have been describing is surrounded by a grand piazza, consisting, according to some writers, of upwards of four hundred and forty pillars, and has thirty-eight gates. It is covered with small domes or cupolas, from the four corners of which rise four gilded steeples. The Caaba made no very splendid appearance in the days of Mahomet, nor even in the reigns of his two immediate successors, Abubeker and Omar: but the structure has been since raised, by the munificence of succeeding princes and great men, to its present magnificent state; though its primitive or original form has not undergone any material change since the year of the Hejira 74. The Mahometans pretend that this Caaba is nearly coeval with the creation, asserting that Adam, after his expulsion from Paradise, obtained permission of the Almighty to erect it; that, however, it was destroyed by the deluge, and that Abraham rebuilt it in the same spot and after the same model.

To the above antique and celebrated edifice it is that the pilgrims in prodigious numbers annually resort, when there is a fair held for all sorts of merchandize; people, in crowds, from different nations, assembling, to the amount generally of not less than two hundred thousand, at which time even the very vaults of mosques, and the caves of neighbouring mountains, are stored with rich commodities.

It must be observed, that the holy temple is opened four times in the year; but 'tis at the solemn feast of the Bayram, or Easter, when the greatest multitudes assemble, who purchase relics of the old black camask covering, previous to its being succeeded by a new one from the Grand Seigneur.

The pilgrims perform many of the most absurd religious ceremonies; and, "as an author, "at a place called Labbock they strip themselves almost naked, having only a napkin round their middle, and another round their neck; in this condition they enter Mecca, but neither buy nor sell any thing for eight days."

Dr. R. Pococke, however, speaking of the pilgrimage to Mecca, says, "The pilgrims bound to Mecca commonly wear a sort of black cloak, with a caul; the people of Barbary wear them white: it is fastened about the neck with a long loop, and hangs loose behind. The camels are ornamented, especially the leading one of every company, which hath on its head a plume of feathers. Many Turks go this journey often; but it is observed, that they are rather worse after it than before, and this is a common saying, "If a man has been once at Mecca, take care of him; if he has been twice there, have nothing to do with him; and if he has been three times at Mecca, remove from his neighbourhood." This is not to be thought an observation of the Mahometans; it is only remarked by the Christians and Jews.

The reflection hath at least great severity, and corresponds with the acrimonious remark of another author, who, speaking of this famous pilgrimage, says, "After all, one would think these were a very pious people; and yet a renegade, who went to Mecca in pilgrimage, affirms that there is as much debauchery practised there as in almost any part of the universe."

As soon as the pilgrims have got into the city, they proceed to the holy temple, and walk round it seven times, the three first times in a very quick pace, to manifest their readiness to fight for the true worship of God. They accompany their prayers with many strange gestures of the body, imitating the Hamirag, or high priest; and, after having made a sacrifice of sheep, repair to the vale of Mina, and throw stones at the devil's head, who they say tempted Abraham in this vale, when he was about to sacrifice his son Ishmael, not Isaac; Ishmael, they say, was the intended victim.

On the mountain of Mina, which constitutes the vale, Adam and Eve, they pretend, wandered upwards of two hundred years without seeing each other, after their expulsion from Paradise, till they happened by mere chance to meet together at the top of this mountain, when Eve threw stones at the devil's head, for his having held up to her a glass, and telling her, that the image she then saw was another woman with whom Adam was enamoured.

From this mountain the priests deliver their pious harangue, and afterwards in the vale make fresh sacrifices of sheep, the flesh of which is given to the poor.

Thevenot asserts, that when he was in this part of the globe, upwards of six thousand persons belonging to one caravan died in the road between Cairo and Mecca, by the hot winds and other calamities; and that the effects of such as die devolve to the priests.

As the northern Arabs owe subjection to the Turks, and are governed by bashaws residing amongst them, they receive considerable gratuities from the Grand Seigneur for protecting the pilgrims from the robberies of their countrymen.

Having, in our above general account of the religious notions and ceremonies of these people, had occasion consequently to make frequent mention of the arch-impostor Mahomet; we shall now present our readers with the life of that sovereign and supreme hypocrite; which we shall conclude with the history of the Caliphs his successors; and then proceed to a description of such of the cities of Arabia as are worthy the reader's attention.

Mahomet died in 632; his successor was Abubeker, who, during the short reign of two years, made himself master of part of Syria; and the conquest of that country was afterwards completed by Omar the succeeding caliph, whose army then marching into Egypt, conquered also that region.

Othman, the successor of Omar, trod in the steps of his predecessors, and signalized his reign by feats of arms: the Saracens penetrated into Persia, and afterwards directing their ravages towards Europe, reduced most part of Spain, France, Italy, and the islands in the Mediterranean.

Thus did the successors of this celebrated hypocrite and impollor extend their victories and their religion over the greatest part of Asia, Africa, and Europe.

SECT. VI.

The Life of Mahomet.

MAHOMET, or Mohamed, as styled by the Arabians, was born at Mecca, in the sixth century, in the reign of Justinian XI. emperor of Constantinople. Mahomet, though illiterate and of mean birth, possessed a most shrewd understanding; he was left an orphan at about eight years of age, and Abuteib his uncle took him under his care. Till the age of twenty he lived with his uncle, who was a factor, and afterwards entered into the service of a wealthy merchant, who dying, Mahomet made his addressees to Cadiga his widow, and married her.

Mahomet, during the time he was in the service of his uncle, travelled into Syria, Palestine, and Egypt, where he made particular observations on the great variety of religious sects, whose antipathy against each other seemed inveterate, at the same time that in many points the majority of them evidently concurred.

After his marriage with Cadiga, he continued his commercial connections for some years with great success, but at the same time was forming a project of instituting a new system of religion, more general than any which had hitherto been established.

As Mahomet well knew the genius of his countrymen, he entertained the most sanguine hopes of success: he was aware that the Arabians were fond of novelty, and that they were addicted to illusions and enthusiasm.

He was powerfully aided in his grand design by Sergius a monk, who being of loose morals, had relinquished his cloyster and profession, and was a servant under Cadiga at the time that Mahomet married her. This monk was exceedingly well calculated, by his audacity, to supply

his grand design by Ser-
e morais, had relinquished
was a servant under Ca-
married her. This monk
ed, by his oration, to
supply

supply the defects of his illiterate master; and when the
latter had maturely weighed the chief articles of the wor-
ship he intended to establish, he made a beginning in
his own family; he was sensible that no religion would
be looked upon as true that was not founded on revela-
tion; his first step therefore was to make his wife Ca-
diga believe, that he had an intimate correspondence
with heaven.

The better to bring this about, he made an artful use
of an infirmity to which he was subject, viz. the epi-
lepsy: whenever he was attacked with fits, he used to
caution Cadiga not to form any erroneous opinion of
the convulsive state in which the saw him; for that, so
far from being a calamity, it was a blessing from heaven;
that these fits were trances, into which he was miracu-
lously thrown by the divine Being, and during which he
received instructions from him; which instructions he
was to make public to the sons of men.

Cadiga, either really believing, or affecting to believe
this curious story, propagated a report, that her husband
was inspired; and the impostor living very abstemiously,
acquired a character for superior sanctity throughout his
neighbourhood. The vulgar implicitly believed, that
he really held a converse with the Almighty, and they
looked upon his epileptic fits as an incontestible evidence
of his inspiration. In a little time Mahomet boldly de-
clared himself a prophet, sent by God into the world to
teach his will, and to compel mankind to pay obedience
to it.

His disciples increasing apace, the magistrates of
Mecca thought it highly expedient to exercise their au-
thority on this occasion, and signified a design of bring-
ing Mahomet before them; the latter however being soon
apprized of their intention, made his escape in the
night, accompanied by many of his deluded people, to
whom he made very eloquent and pathetic harangues,
touching the obliques raised by the wiles of Satan, to
the propagation of those tenets that had been revealed to
him.

The ignorant people, captivated with the force of
his language, devoted themselves entirely to his will,
with offers of sacrificing their all in defence of him and
his doctrine.

He proposed to them, that his system should extend
over all the neighbouring nations. The eastern nations
were at this crisis infected with the heresy of Arius, and
Egypt as well as Arabia was filled with Jews, who had
come higher on account of the persecution of the emperor
Adrian: the other inhabitants of these countries were
Pagans.

Mahomet travelled to Yatreb, which was afterwards
called Medina al Nabi, signifying the city of the prophet.
It is also called simply Medina, or the city, as meriting
to be honoured with that name alone, from its having been
an asylum for the great prophet.

To the time of the above flight to Medina the fol-
lowers of Mahomet have fixed their grand epocha, which
they called Hejira, or flight; and thence commenced
their common era.

Mahomet got vast numbers of disciples at Medina;
to whom he declared that there was one God, who created
the world, and governed all things in it; that he had
sent several prophets into the world, the most eminent
of whom were Moises and Jesus Christ; but that as
the endeavours of these had not been attended with suc-
cess, God had now sent his last and greatest prophet,
with a commission far more full and extensive than what
either Moises or Christ had been vested with.

Mahomet soon finding himself very formidable, and
secure in the attachments of the soldiery as well as
others, meditated an attack upon Mecca. His disciples
approved of his design, and accordingly he sent forth a
considerable force under the command of one Hamza,
a very near relation of his, (an uncle) and whom he
thought worthy of his confidence, in consideration of
the zeal the latter had constantly shown for his doctrine.
Hamza, who to the blindest zeal joined the most con-
summate natural bravery, marched at the head of a
numerous body, and laid siege to Mecca, but was re-
pulsed with considerable loss.

This repulse, however, was so far from disconcerting

the besiegers, that it spurred them on to the resolution
of a second attack. They improved themselves in the
military art with the utmost assiduity; for it was religion
that they meant to fight for; their good prophet had told
them that he must, in conformity to the will of God,
convert the people of Mecca; that he must subdue those
who refused to obey him; for that he was to establish a
kingdom upon earth which should propagate the divine
law throughout the world.

They accordingly a second time began their march from
Mecca, and on their road fell in with a caravan of
Coraischites, whom they furiously attacked, defeated,
plundered, and killed those who refused to embrace the
doctrine of the holy prophet, who then proceeded on to
Mecca, and forced that city to surrender; but he was
afterwards defeated at the battle of Ohod.

Abu Sofian, his implacable foe, having put himself at
the head of the Coraischites, caused his troops to ad-
vance towards Medina, and possessed himself of Mount
Ohod, distant about four miles from that city. Ma-
homet made a most furious attack upon him, to drive
him from his post, and in the beginning of the action
obtained some small advantage; but being wounded, was
obliged to quit the field.

His disciples, finding their prophet had left them, were
struck with a general panic, and a terrible slaughter was
the consequence. Numbers of them however got safe
back to Medina; for the victors, instead of pursuing
the fugitives, employed themselves in mangling the bod-
ies of such as had fallen in battle.

The women in particular were cruel beyond example;
for women, in these days, used to attend their husbands,
and frequently beat the drum at the head of a tribe.

The women, as hath been hinted, were most inhu-
manly barbarous; they cut and ripped up the bellies of
the wounded as they lay groaning on the ground; and
it is related of Hondah, the wife of Abu Sofian, that
seeing the body of Hamza lying among others, she
ripped him up, and with her teeth tore out his liver.

The above battle was a terrible stroke to Mahomet;
and he felt it still more severely when he discovered
himself exposed to the reproaches of many who had lost
their relations and friends in it: his imagination how-
ever, always fertile, soon suggested to him the means of
silencing the murmurings and complaints of the people.

How he effectuated this, we have already mentioned
in section V. It was by the following cunning subter-
fuge: "He calmed the minds of his party, alter their
defect, by representing to them, that the time of every
man's death is decreed and predetermined by God;
and that, therefore, those who fell in the battle of
Ohod, could not possibly have lived, had they staid at
home: for the inevitable hour of their dissolution was
arrived."

The minds of the zealots thus made perfectly easy,
they appeared more heartily disposed to serve him than
ever; and of this indeed they gave many proofs on
different occasions, when the prophet was attacked by
several tribes, whom he defeated and massacred.

Whilst Mahomet was engaged in subduing his coun-
trymen, his general officers, in his name, obtained con-
quests in distant countries; and he was soon master of
Medina, and many other cities on the frontiers of Syria.
The several tribes came to pay him homage, except the
Coraischites, who however laid down their arms for a
truce, to which the prophet assented, and a truce was
accordingly concluded for ten years. It may appear
somewhat surprising that he did not endeavour to suppress
the only tribe which refused obedience to him; but he
thought it better policy to defer it till a more eligible
opportunity should offer; besides, this truce highly fa-
voured a project he had formed of establishing a pilgrim-
age to the Caaba of Mecca; to which end, he issued
an edict, commanding all such as had embraced his
religion to repair to Mecca to perform their devotions.
He also fixed the time for their setting out on this pil-
grimage, and prescribed the ceremonies to be observed
on the occasion; and that he might not give any um-
brage to the Coraischites, he ordered that all the pil-
grims should go unarmed.

As soon as it was known that Mahomet was on such
amicable

amicable terms with the Coraichites, crowds of disciples flocked to him. These were the events of the seventh Heigera.

Things thus far carried on, Mahomet took up arms against the Jews: indeed he had attacked these people previous to his defeat at Ohod, but was checked in his career of victory by that fatal affair.

He seized several of the Jews towns, and amongst others Kaibar, one of the strongest; but after that had like to have met with his death. Having taken up his lodgings at the house of one of the principal citizens, whose name was Hareth, among other things a poisoned shoulder of mutton was served up at table, of which the prophet eat, and was soon taken ill: proper remedies were however applied, and his life preserved, though the poison was never totally eradicated. Who committed this atrocious offence nobody knew, and it was not the prophet's interest to complain much, or busy himself about the matter: however, after his death it was discovered, that Zeinaby, daughter of Hareth, had given him the poison, on this principle, that if he was the great prophet he pretended to be, the poison could have no effect on him.

Part of the poison lurking in the body of the prophet, notwithstanding many remedies had been applied, he at intervals was much indisposed: this, however, did not prevent him from pursuing the victory of his arms; he marched against the Greeks, and lighted up the first spark of that fatal war which his disciples so rigorously carried on for several centuries.

Authors differ in opinion as to the cause of this war. Be the cause what it would, certain it is, that the war was begun with all the fury that bigotry and vengeance could inspire. Mahomet did not head his troops himself, but gave the command to a general of experienced valour and intrepidity, named Kaled Wahd, who was of the tribe of the Coraichites, and had distinguished himself greatly in their service, but afterwards flew to Mahomet, and became his strenuous disciple.

Khaled began his march at the head of only three thousand troops, and had the boldness to give battle to an army of near twenty thousand. The action happened near Mouta in Syria, and both armies engaged with the utmost fury; but the first shock was really fatal to the Mahometans, through the inequality of their numbers. Almost all the officers being killed, the troops lost their courage, and were on the point of giving ground, when Khaled grasping the standard of their religion, and flying from rank to rank, cried, "Now will we break through the battalions of these Greeks, and wrest the victory from their hands, or receive a glorious crown of martyrdom." This alternative, flattering to bigots, revived their courage. Khaled falling furiously on the enemy, the troops followed his example, and obtained a victory.

After the above battle Mahomet went in pilgrimage to Mecca, attended by a vast concourse of Mussulmen. The pomp and magnificence he displayed in his journey, and the surreptitious slew of religion with which he visited the Caaba, made a great impression on the inhabitants of Mecca, and especially the Coraichites, numbers of whom embraced his religion: the example of these, however, did not seduce the rest of the Coraichite tribes; they on the contrary broke the truce that had been made, and gave Mahomet battle, but were totally defeated; and such as did not, in consequence of this defeat, embrace his religion, were massacred on the spot.

Mahomet caused himself to be acknowledged sovereign of Mecca; and the beginning of the year following, which was the eighth of the Heigera, some few scattered dissidents, who had escaped the sword of the tyrant, contrived with great judgement and diligence to form a considerable party; and, as soon as they found themselves sufficiently formidable, took the field, ravaging many of those parts that had submitted to his power.

The prophet, enraged at the insolence of this presumptuous faction, put himself at the head of his forces, and marched to give them battle: accordingly a bloody engagement ensued, at a place called Honaim, in which the troops of Mahomet, though superior in number to the enemy, were vigorously repulsed: upon which the prophet, flying to the yielding ranks, and re-animating

them with his personal courage, rallied them, and obtained a most decisive victory.

This put a final end to the Arabian liberty, and Mahomet caused himself to be acknowledged sovereign of all Arabia. He destroyed all the idols and monuments of paganism, and suffered no other religion to be professed but his own.

He now made a second pilgrimage to Mecca, considerably more solemn, and magnificent than the first, and performed all the ceremonies with great appearance of devotion. He erected courts of justice, appointed proper officers, and constituted a pontiff or high priest. He no longer appeared the dreadful conqueror, but the mild legislator, and the Arabians were soon reconciled to his government.

Mahomet took a proper advantage of this general tranquillity; he strengthened his armies, and exercised them himself: and the good policy of such precaution was soon apparent; for the Greeks, who ill brooked the disgrace they had suffered at the battle of Mouta, resolved on revenge, and advanced to Balka, a city on the frontiers of Syria. Mahomet, at the head of thirty thousand men, went to meet them; but the Greeks, alarmed at so numerous an army, thought proper to retreat, and the prophet employed the remainder of the year, which was the tenth of the Heigera, in revising the several laws he had made for the government of the state. He then made his third and last pilgrimage to Mecca, which far exceeded the two former in pomp and magnificence: some of the most considerable persons in Arabia accompanied him; and his wives (for he had more than one) also attended him in stately litters, borne by camels.

To inspire the people with the most awful veneration for his doctrine, and at the same time to evince to them that he was the supreme head as well in spirituals as temporals, he now himself performed the office of pontiff: he preached in the temple, and concluded his harangue with the proposition of new regulations, which he afterwards published, touching the rites and ceremonies of the newly-established religion.

He caused several camels to be slain and offered as sacrifices; which festival was concluded by a general farewell that he took of the people. He found his health much on the decline; the poison that he had swallowed some years before, now operated with greater violence than ever; he perceived that his dissolution was not far off, and took a formal leave of his people in the last religious harangue he made to them.

On his return to Medina, his illness considerably increasing, he repaired to the house of Aickfa, who was his favourite wife, and there died at the age of sixty-three.

That he was dead, however, many of his disciples could not be persuaded to believe, notwithstanding the most evincing proofs was given of the fact. Omar, one of the most zealous of them, was particularly violent in that ridiculous opinion, and even threatened to run the first man through the body who should dare to say that the holy prophet was dead. All Medina was in a state of tumult and confusion: at length, however, Abubeker, a person of great circumspection and prudence, solicited leave to harangue the disturbed multitude; and permission being granted, he with very forcible arguments silenced the clamours of the most vehement amongst them, not excepting even Omar himself. He proved manifestly, from the sacred koran, as well as by the common evidence of natural reason, that Mahomet was really dead.

The tumults of the people then gradually subsiding, through the wisdom and prudence of this man, the only object of contention was now the place of burial for him: some insisted that he should be buried at Mecca, because it was the place of his nativity; others said he ought to be buried at Medina, as having been the place of his residence; and others argued that Jerusalem ought to be his burial place, as being the true city of the prophets.

The sensible Abubeker, put an end to the dispute, by relating an expression which he said he had heard from Mahomet's own mouth, and which was, that prophets ought

grave was accordingly dug, and the prophet was buried
at Medina; so that the opinion which some have
maintained that his body was placed in a sepulchre at
Mecca, is entirely erroneous.

The reader, from what has been above related, will
be able to form a pretty accurate idea of the prophet,
conqueror, and legislator: we shall now offer a few
ords with regard to his general mental faculties,
and shall then close the section with such remarks as are
necessary relative to his successors.

Added to an engaging countenance and well-propor-
tioned figure, Mahomet possessed a most comprehensive
genius, and a firmness of soul ever capable of encombating
the greater difficulties: steadfast and resolute in the
pursuit of the most amazing projects, he was possessed
of the means of procuring success; his deep penetration,
his excellent judgment, his never failing courage, his
unwearied perseverance, and refined sagacity, supported
and directed him to a state of prosperity and triumph
in almost every thing he undertook.

Mahomet made no scruple of acknowledging that he
had not received any education, though author of the ko-
ran; he was however one of the finest and most eloquent
speakers in the whole country. He had not only a very
good memory and lively conception, but was of a cheer-
ful and even temper: he could suit himself to all times,
circumstances, and dispositions; he was as familiar with
the nobility as he was popular with the commonalty,
and could lend an ear of real (or affected) commiseration
to the supplications of the distressed.

It may not be unworthy of remark here, that after
the decisive battle of Hionaim, when the prophet made
a second pilgrimage to Mecca, a poet, who had severely
lampooned him, solicited the honour of being intro-
duced to him, that he might repeat some verses he had
written in his praise; for the face of things was now
considerably changed.

The prophet could not forget the severity with which
he had been treated by the poet; to shew resentment,
however, would have been a degradation of dignity; he
therefore granted him permission to approach.

The poet came trembling to his new sovereign, and
on his knees imploring forgiveness for the rash freedom
he had taken in his satires, began to pronounce his ver-
ses, being encouraged thereto by the mildness and com-
placency that sat on the prophet's countenance.

The verses were so masterly, so graceful, pathetic,
eulogial, and elegant, that Mahomet not only most freely
and readily pardoned him, but presented him with a
rich mantle from off his own back, and which he him-
self placed on the back of the poet.

So singular and distinguished an honour immortalized
Caab, (for such was the poet's name), who wore it
till his death with all the exulting pride and ambition
natural to a human being on so remarkable, so memo-
rable, and so great an occasion.

Mahomet was much addicted to women, but had the
art to prevent this vice being of any prejudice to his doc-
trine; on the contrary, he would sometimes make a
merit of it, pretending that it excited him to devotion.
"There are two things in this world, said he, which
are equally pleasing and necessary to me, women and
perfumes; both delight me, and stir me up to fervency
in prayer."

Historians do not agree as to the number of his wives:
an Arabian author says he had seventeen, besides concu-
bines. It is certain he had more than allowed by the
koran; but he had privileges grounded even on revela-
tion; and the same koran which made a particular decr-
eation criminal, and forbid the Arabians in general
the practice of it, gave free licence to the legislator to

The circumstances of this assassination are rather singular. A
native of Petra named Feroos, refusing to embrace Mahometanism,
a tax was levied upon him; upon which, he made his complaints
to the caliph, soliciting that the tax might be taken off, or at least
reduced, as he was incapable of paying it. "What trade do you
follow?" said Omar. The man replied, that he had none. "Very
well, added the caliph, then you are taxed very moderately." Fe-
roos, however, who possessed a most wicked and vindictive soul, en-

exercise. Cadiga, his first wife, died three years before
the commencement of the heigera, being in her sixty-
fifth year. Aiesha, another of his wives, and who was
daughter of Abubeker, survived the prophet, as did
Hafia, who was daughter of Omar, and to whom the
care of the koran was committed after her husband's
death.

As Mahomet died without male issue, and had no-
minated no successor, different parties rose, claiming an
exclusive right of appointing one. Abubeker, however,
who had always been the friend of peace and good order,
proposed two persons, Omar and Abou-Obeid, for their
choice of one of them; but this proposition created still
greater divisions, and the election remained undetermined,
till Omar, to the astonishment of every person present,
addressed himself to Abuteker, and kissing his hand, de-
clared that he (Abubeker) would assume the sovereignty
himself; and the latter was accordingly chosen, amidst
the acclamations of the assembly: but he refused, from
an inviolable veneration to the memory of the holy pro-
phet, to take on him the title of sovereign; he chose that
of Caliph, signifying successor; and which was after-
wards the title of all who reigned over the Arabs.

But if Abubeker was indebted for his dignity to the
presence of mind of Omar, it is to be presumed that the
hope which the latter entertained of one day possessing
the sovereignty, suggested to him the happy sentiment.
In being the instrument of nominating Abubeker, who
was then far advanced in years, he had a view of the
crown for himself: nor was the election of the former
accomplished without occasioning some murmurings
afterwards; for Fatima, daughter of Mahomet by his
wife Cadiga, had been married to a cousin of the pro-
phet's, named Hali, who was not present at the election,
and who, of consequence, was exceedingly dissatisfied.
Besides, it was affirmed that those lineally related to the
prophet had the greatest right to the crown.

Omar, therefore, at the request of Abubeker, went
to the house of Hali, using his utmost endeavours to pre-
vail on him to assent to an election that had been made
in due form by the concurrent suffrages of the nation;
but no persuasives had any effect; Omar therefore found
himself obliged to make some very severe menaces, and
Hali at length came and did homage to Abubeker, not
however without expressing his astonishment at what had
happened.

Abubeker, sensible that Hali ought at least to have
been present at the election, and that his complaints
therefore had been well grounded, proceeded to a jus-
tification of his own conduct, by relating every circum-
stance that had happened; and Hali, convinced that Abu-
beker had been actuated entirely by a love of his country,
became quite reconciled, and ratified the homage he had
paid him.

On the death of Abubeker, Omar was elected caliph
without opposition, having been nominated by the for-
mer; and Omar, who was assassinated*, was succeeded
by Othman, who also met with the like fate.

Hali, after the respective reigns of Abubeker, Omar,
and Othman, obtained the Caliphship, but had no
sooner ascended the throne than he quarrelled with every
person about him, and at length became so generally
obnoxious to his people, that he was forced to quit his
capital. A revolt ensued in Syria; and Moawiyah the
governor thereof, declared Hali unworthy of reigning,
and caused himself to be proclaimed the only lawful ca-
liph, fixing his seat at Damascus. Hali took up arms,
but was defeated, and even was happy that by means
of a treaty he could secure the possession of the title and
privilege of caliph in Arabia. He was soon after as-
sassinated, leaving two sons, one of the eldest of whom the
Arabians bestowed the crown.

Hassan, son and successor of Hali, after a reign of only

tering the mosque a few days afterwards while the caliph was there,
took an opportunity of stabbing him in three different parts of his
body with a knife. Instantly the wretch was surrounded; but he
defended himself with the bloody instrument, and stabbed thirteen
others, seven of whom died in a few hours. Fifth efforts, however,
were made to secure him; and the assassin at length discovering he
should be over-powered, plunged the knife into his own bowels and
expired.

about six months abdicated his throne in favour of Moawiyah, who had been a continual terror to him; so that Moawiyah now became sole possessor of the throne: he was acknowledged by all muslimen as the true and lawful caliph, and was the first of the dynasty of the Ommyians, so called from Ommyyah the head of that prince's family. As soon as this prince was firmly seated on the throne, his first grand object was to augment his glory; he prosecuted such enterprises as former caliphs had begun against the Greeks; he drove them out of Armenia and Anatolia, and adopted measures to render the dignity of caliph hereditary, which had been before elective, and succeeded in his design: his crown descended to his son, and afterwards to the rest of his posterity.

That dynasty of princes maintained themselves with great glory for fourteen successions, though not always in a right line; for brothers often ascended the throne to the prejudice of their nephews, when the latter were not of due age, or there were any other reasons that artifice could assign; but the succession was always in the house of Ommyyah till the time of Merwan the second.

The house of Ommyyah however was destroyed by the Abbassians, princes so denominated from their being descended from Abbas, uncle of Mahomet. They took up arms against the Ommyians, under pretence of revenging the death of Hali, whom, they alleged, had been murdered by them, and Abul Abbas was accordingly proclaimed caliph.

Abdallah, uncle of Abul Abbas, caused an act of grace to be published, in the caliph's name, for all the Ommyians who should appear before him, and take the oaths of allegiance to the new caliph. A day was fixed for a meeting of the chiefs or princes, and Abdallah attended them; but while he was preparing to tender the oaths, a party of soldiers, appointed for the purpose, drew up behind them, and destroyed them all on the spot, except one, who escaped and fled to Spain. Immediately after this barbarous deed, the soldiers put to the sword a great number of muslimen known to be devoted to the house of Ommyyah; and Abdallah, having put an end to the slaughter, completed his bloody transactions with a most horrid entertainment!

The above infernal monster caused the bodies of the Ommyians, who had been slaughtered by the soldiers, to be placed close to one another, and covered with boards, over which he ordered carpets to be laid; and upon this flooring, formed by dead carcases, he gave a sumptuous feast to the officers of the army. "Perhaps," said he, "all of them may not be quite dead; in that case we shall have the happiness to hear them groan."

Such was the beginning of the reign of Abul Abbas, who however was not accused of having any share in the above massacre; nor did he enjoy the throne long, for he was seized with the small-pox, and died at the age of eighteen.

The above prince was succeeded by his brother Abu Giaffer, surnamed Almanzor, or Victorious; and soon after he had assumed the diadem, his uncle, the infamous Abdallah, was crushed to death, with several others, by the suddenly falling-in of the floor of a chamber in which they were sitting.

Almanzor built the city of Bagdat, which was the capital of the empire till the race of Abbas became extinct; on which account the Abbassians have been commonly called caliphs of Syria, on account of their constant abode in that country.

The Abbassians, who styled themselves the true children of the house of the great prophet, possessed the diadem for more than five hundred years, under thirty-seven princes.

The ruin of the house of Ommyyah was solely owing to the unlimited authority with which they entrusted the governors of their provinces: the descendants of Abbas fell into the same error; this however supported their dynasty longer than the Ommyians, but with less splendour with regard to the extent of their authority. During their reigns, part of their empire was at several times granted away; and the territories, thus dismembered, were erected into as many dynasties: of these were the Thakerians, and the Soffarides, who reigned in Persia,

Tranfoxtana, and Turkestan; as also the Tholaniades and Afchidians, who ruled Egypt under the title of sultans, though at the same time they acknowledged the supremacy of the caliph of Bagdat. But the Afchidians were succeeded by the Fatimites, who pretending to be the true and rightful successors of Mahomet, as descended from Hali by Fatima, assumed the title of caliph in Egypt. Thence the name of the caliphs of Bagdat was suppressed in the public prayers throughout the whole extent of their dominions: the new dynasty possessed the full and entire sovereignty for almost three hundred years, when, however, the Egyptian Fatimites were at length totally ruined by the caliphs of Bagdat, who recovered the possession of Egypt and Syria, owing to the masterly conduct of Salaheddin, or Saladin; to whom, on confederation of his services, the caliph Nasser solemnly confirmed the sultanhip of Egypt and Syria; and in the bestowal of this grand act of favour, Nasser acquired a constant protector; and while the Mussulmen of Egypt and Syria were fighting against the Christian armies under the banners of Saladin, Nasser quietly enjoyed at Bagdat all the honours due to the caliphate, being acknowledged sovereign in all countries then inhabited by Mussulmen.

After the extinction of the Fatimites, a new dynasty arose, called Gengiskanians, from Gengiskan their founder. This prince, who became highly renowned on account of the rapidity of his exploits, put himself at the head of an army of Moguls and Tartars, and soon conquered an immense tract of land: his successors, who inherited his bravery, as well as his antipathy to Mussulmen, added to their crown almost all the states which had been seized by the princes of the other dynasties, and at length made themselves masters of Bagdat, massacred the caliph and his children, and by their death put a final end to the illustrious house of Abbas, which had sat on the throne upwards of five hundred years. At this period the history of the caliphs properly concludes; for we cannot include, among the caliphs, Ahmed, who was three years afterwards proclaimed caliph by the Mammalukes of Egypt, under the name of Mostanser Billah. They called him the son of Daher ben Nasser the Abbassian; and Bibars, who was then sultan of the Mammalukes, caused him to be recognized in Egypt; so that a second dynasty of Abbassians was formed, if the name of dynasty can be allowed to a race of princes who were only looked upon merely as the head of the church. This pretended dynasty subsisted till the end of the reign of the Mammalukes, in the nine hundred and twenty-third year of the heigera, and the one thousand five hundred and seventeenth of the Christian era; when Selim, the first emperor of the Ottoman Turks, annexed all Egypt to his empire.

We shall now present the reader with a chronological account of the caliphs, from Mahomet, founder of the Arabian empire.

We shall now, as we proposed, give an account of
the cities of Arabia, and of the ruins of Palmyra.

S E C T. VII.

*Of the Cities of Mecca, Mocha, Aden, and Medina;
with an Account of the famous Mosque and Tomb of
Mahomet in the latter city.*

THE ancient city of Mecca is situated in a valley,
and surrounded by mountains, from whence the
stone of which it is built was taken: it is about two
miles in length, and a mile broad. The temple is in
the middle of the town, and is called Masjid Al Haram,
or the sacred temple, of which we have already given a
description: the houses here make no great figure; nor
is it a place of any strength, not having any kind of for-
tifications. The principal support of the city is the con-
course of the pilgrims who come hither. The Xerif of
Mecca generally resides at his castle of Marbaa, about
three miles distant; his troops are entirely infantry,
called Al Harabah. There are scarce any springs in
or about this city except the Zemzem, the waters of
which cannot be drank for any continuance, being rather
brackish, and causing eruptions in those who drink too
freely of it; so that the inhabitants are forced to use
rain water caught in cisterns. Many attempts have
been made to convey water to the city by means of
aqueducts, but have all proved ineffectual.

Mocha is a large, populous, trading city and sea-
port, situated at the entrance of the Red Sea. It con-
tains about one thousand inhabitants, mostly Mahome-
tans; and here are great numbers of Jews, but these

A R A B I A.

are obliged to live in the suburbs. The city, which is
surrounded by a wall, has four gates and several towers,
some of them mounted with cannon, and garrisoned
by soldiers. The streets are spacious, and the houses
are of brick or stone, consisting of two stories, with
terraces on the top of them. The shops are judiciously
built for trade, and stored with all sorts of commodities.
Here arrives annually the great ship Manfour, sent by
the Grand Seignior, laden with the richest merchandizes,
and carrying back spices, silks, calicoes, and other
valuable articles. Caravans also arrive yearly from
Turkey and Egypt. The port of M. is formed by
two slips of land, on each point of which is a fortress,
at the distance of about three miles from each other. A
considerable branch of commerce of this city is coffee,
which is cultivated at Betel-fagui in the territory of
Yenen. Mocha was no more than a mean village of
fishermen, till the king of Yenen drove the Turks from
Aden, and removed its trade principally to the above-
mentioned city.

Aden is a large, populous city, containing about six
thousand inhabitants, and was a place of prodigious re-
sort till its trade was chiefly removed to Mocha. It is
situated between the Persian Gulph and the Red Sea.
Aden is so called, according to the Arabians, from its
founder Aden, the son of Saba, and grandson of Abra-
ham. It is surrounded by mountains, the summits of
which are fortified with cannon; and from which an
aqueduct conveys water into a capacious reservoir, about
half a mile from the city. There are many handsome
houses, with terraces on their tops, in Aden; and the
place is well secured, by its advantageous situation, and
proper fortifications. The Turks became masters of this
city, through treachery, in 1538, and with their usual
cruelty hung up the prince of it: they committed further
acts of inhumanity, till the prince of Yenen, as we
have mentioned under the article of Mocha, extirpated
them.

Medina, which is about fifty miles from the Red Sea,
is situated in a plain, and is surrounded by a wall of
brick. Here are the mosque and tomb of Mahomet;
the mosque is supported by four hundred pillars, and sup-
plied with three hundred silver lamps, which are kept
continually burning: near the tomb of Mahomet there
is also the tomb of Abubeker.

Medina has several other grand mosques; but that of
Mahomet is styled the Most Holy. The houses of this
city are in general low, and contain about twelve hun-
dred families.

Mahomet's tomb, which is in one of the angles of
the magnificent mosque, is of fine white marble, covered
with a grand cupola. The roof of the mosque itself is
a kind of tower covered with plates of silver, and on its
flooring is thrown a rich gold cloth.

The inside of the prophet's tomb is enriched with
precious stones, of great size and beauty. Over the
foot of the coffin is a golden crescent, so curiously
wrought, and adorned with such precious stones, that
its value is immense. The coffin is covered by a rich
pall of gold and silver tissue, over which is a canopy of
the same: both are sent annually from the Bashaw of
Egypt, by order of the Grand Seignior, with the greatest
pomp imaginable, on the back of a camel; which ani-
mal derives a kind of sanctity from it, and is never
afterwards used in any sort of drudgery.

S E C T. VIII.

*Arabian Antiquities, &c. General Account of Palmyra or
Tadmur in the Desert.*

THE magnificent remains of Palmyra are a subject
of too much importance not to merit our very par-
ticular attention. Before, however, we proceed to a
description of these splendid ruins, we shall lay before
our readers the sentiments and words of two able writers
on the subject, and then particularly treat of so cele-
brated a piece of antiquity.

"Is it not a little strange," says one of them,
"That history scarcely furnishes us with any informa-
tion, except such as is purely conjectural, concerning
Palmyra? This chasm in history may perhaps be owing
1 to

to the loss of books; or perhaps the ancients did not look upon Palmyra as worth their regard, being much inferior to many other buildings which they had."

The other gentleman says, "Nothing but ocular proof could convince any man, that so superb a city, formerly ten miles in circumference, could exist in the midst of tracts of barren uninhabitable lands. Nothing however is more certain, than that Palmyra was formerly the capital of a great kingdom; that it was the pride as well as the emporium of the eastern world, and that its merchants dealt with the Romans, and the western nations, for the merchandizes and luxuries of India and Arabia. Its present altered situation, therefore, can be accounted for only by natural causes, which have turned the most fertile tracts into barren deserts."

As Palmyra is situated in a dreary desert, quite from any common road, and beyond the Grand Scion's protection, there is no part of a tour through the East so difficult as a journey to it. An enquiry, however, into the ruins of this place was resolved on by the ingenious Mr. Dawkins, who was soon joined by Mr. Wood, and Mr. Bouverie, the latter of whom died before the design was carried into execution. The fourth person who had engaged in this peculiar undertaking, was an Italian of experienced skill in architecture and drawing. The rendezvous of this scientific society was at Rome; where they spent a winter in studying the ancient history and geography of the places they intended to visit.

In the spring ensuing, these gentlemen set out for the kingdom of Naples, where they met with a ship from London for their particular use, having on board her a collection of Greek historians and poets, besides many volumes of antiquities and voyages, several mathematical instruments, &c. which it was presumed might, as presents, be of infinite service.

As soon as they had embarked, they made sail for the Archipelago, and visited every thing worthy their observation there, as well as part of Greece, Europe, the coasts of the Hellepont, Priontis, &c. up to the Black Sea; also as the inland parts of Asia Minor, Syria, Phœnicia, Palestine, and Egypt.

They copied every inscription they happened to meet with, and bought up all the Syrian, Greek and Arabic manuscripts they could possibly get.

The chief design of Mr. Dawkins in this tour, was to compile an history of the three Greek orders of architecture, at least with respect to the changes from the days of Pericles to those of Dioclesian.

The difficulty of a journey to Palmyra, on account of its peculiar situation, has been already remarked on: no difficulties, however, could deter our adventurers from prosecuting their truly laudable plan. In the course of their peregrinations, during which they inspected every piece of antique architecture, they visited Damascus by the way of mount Libanus, over which they crossed, and were here informed that neither the name nor power of the bawhaw of Damascus could be any security to them, Palmyra being entirely out of his jurisdiction, and under that of an Aga, who resided at Haffia, a village on the great caravan road from Damascus to Aleppo, and from which the Orontes is but at a short distance.

To Haffia they went, and were most kindly received by the Aga, who expressed great surprise at the journey they had undertaken, and gave them an escort of his best Arab horsemen, properly armed, who in a few hours conducted them to Sudud, travelling through a desert swarming with antelopes.

Sudud is a miserable villa, consisting of huts, built only with mud hardened by the sun: the inhabitants are Maronite Christians, who just cultivate as much land as they have occasion for, and make tolerable red wine.

At this village they dined, and bought of a priest some Greek manuscripts: from thence they proceeded to a Turkish village called Howazen, a mean place, but which it was presumed had been once a situation of some consequence: there being in it a square tower with projecting battlements, and two mouldering churches, in the walls of which were several Corinthian capitals, as well as large Attic bases of white marble.

From this place they bent their course for Carieteen, a village in which were some few broken columns, and Corinthian marble capitals, with two imperfect Greek inscriptions. Here they rested best part of the second day, to collect their people, and give their cattle rest; for in this part of the desert they may be easily lost, there being no settled stages; nor is there any water.

By the above day's delay, all the caravans had time to come up, with whom this kept company, and travelled two days without either rest or water.

The company were now about two hundred persons in number, with their camels, mules, asses, &c. and the chief guide told the travellers, that as they were now in the most dangerous part of the way, it was requisite they should put themselves entirely under his direction: in consequence of which, the servants with the baggage were ordered to fall back to the rear, there to remain protected by the Arab escort, from which two or three horsemen, who rode Tartar fashion, with very short stirrups, were dispatched, for discovery, to every eminence in sight. The road was north by east, through a flat sandy plain about ten miles broad; nor was there a single tree or a drop of water to be seen.

At the approach of night, in this gloomy place, the Arabs dismounted from their horses, and seating themselves in a circle, smoked their pipes and drank coffee.

At midnight the caravan halted two hours to refresh; and on the fourteenth of March at noon, it arrived at the end of the plain, where some hills appeared; and here a valley was soon seen, in which was a ruined aqueduct that once conveyed water to Palmyra; the sepulchres of the ancient inhabitants of which city lie thick both on the right and left, being square towers of considerable height: and soon after having passed them, a sudden opening among the hills exhibits a prodigious number of grand ruins of white marble, and beyond them a flat waste, extending quite to the Euphrates.

No prospect can be conceived more romantic, more striking, more melancholy, or more grand. Here are innumerable piles of Corinthian pillars, without any intervening building, or wall of the least solidity.

In this venerable, this solemn, splendid, romantic situation, our virtuosi staid fifteen days; during which time the Arab inhabitants entertained them in their huts with mutton and goats-flesh.

"The walls of this ancient and stupendous city were flanked," says Mr. Wood, "with square towers in many parts, particularly on the south-east, but nothing of them exists; and, from the best computation I could make, I imagine their circuit could not have been less than three English miles, provided they include the great temple. But as Palmyra must, when in its flourishing state, have been much more than three miles round, it is not improbable that the old city covered a neighbouring piece of ground, the circumference of which is ten miles, and in every spot of which, the Arabs say, ruins are turned up by digging. This is a still more reasonable supposition, when we remember that such fragments of antiquity as are found upon the three miles compass, just now mentioned, could have belonged only to magnificent sepulchres and public edifices of the grandest kind; the most evident proofs that can be of an extensive city. Perhaps then the walls, just now spoken of, inclosed only that part of Palmyra which its public buildings occupied in its most prosperous state; and were fortified, if not erected, by Justinian, who, according to Procopius, judged this a proper place to stop the furious progress of the Saracens. By so closely inspecting this wall, it appears that two or three of the flanking towers on the north east were formerly sepulchral monuments; and this is some proof that the walls were posterior to the monuments, and the work of a Christian era; for the pagan religion would have condemned the metamorphose as profane; besides, the Greeks and Romans always buried without the walls of their respective cities; and the same custom was religiously observed all over the East."

North west of the ruins of Palmyra, on the summit of a rocky hill stands an antique castle, the ascent to which is very steep and rugged: it is a mean structure, not so old as the time of Justinian. It hath a ditch round

round it, which cannot be passed without some difficulty, the draw-bridge being broken down. There is one building here, the remains of which are truly grand; and this, according to the opinion of Mr. Wood, was the Temple of the Sun, which being much injured by the Roman soldiers, when Aurelian took the place, that emperor ordered, for the purpose of repairing it, three hundred pounds weight of gold, taken from the treasures of Zenobia; and one thousand eight hundred pounds weight of silver, levied upon the people; besides the jewels of the crown. The height and solidity of the walls of its court tempted the Turks to convert it into a place of strength, and then on the north east and south they stopped up the windows, dug a ditch to the west, and demolished the portico of the grand entrance; building in its place a square tower, to sink that side. To the east and south of this temple are some plantations of olives, and some small fields of corn, surrounded by mud walls, and watered by two streams, which, though hot and sulphurous, are by the inhabitants deemed very wholesome. One of these streams rises west of the ruins, in a grotto nearly high enough to admit of a man's standing upright; the whole bottom is a basin of clear water, about two feet deep, and the place, on account of the heats being confined, is used as a bath. By an old inscription found here, on an altar sacred to Jupiter, we learn that this stream was much esteemed while Palmyra flourished, and was under the care of certain people elected thereto by ballot.

In the desert, three or four miles south-east of Palmyra, lies the valley of Salt, whence Damascus and the neighbouring towns are supplied with that commodity. In this place David is supposed to have smote the Syrians, as mentioned in Samuel, book ii. chap. viii. ver. 13. The ground is impregnated with salt to a considerable depth; and here they have a method of hollowing the ground to about a foot deep, and from the rain water that lodges in it a fine white salt is gathered.

"We have but little information from history," says Mr. Wood, "of either Balbec or Palmyra: what knowledge we have is chiefly from inscriptions. Does not this defect convey instruction, and convince us of the instability of human grandeur? The fate of these two cities differs from every other; we have no testimonies of what they were, but their own noble fragments;" which are described in the following manner by another author:

"Palmyra, in the deserts of Arabia, or, as by the scripture styled, Tadmor in the wilderness, is a most awful spectacle. As you approach, the first object which presents itself is a ruined castle, on the north side of the city. From it you descry Tadmor, inclosed on three sides by long ridges of mountains; southward of it is a vast plain extending far beyond the sight. The city must have been of large extent, from the space now taken up by its ruins; among which live about thirty or forty miserable families, in huts of dirt, within a spacious court which once inclosed a magnificent temple. This court hath a stately high wall of large square stone, adorned by pilasters both within and without; there are about sixty on each side. The beautiful cornices have been beaten down by the Turks. Towards the centre are the remains of a castle, shrouding the fragments of a temple of exquisite beauty, as appears by what is still standing of its entrance, viz. two stones thirty-five feet long, carved with vines and clusters of grapes. In the great court are the remains of two rows of very noble marble pillars thirty-seven feet high, with capitals finely carved, and the cornices must have been of equal elegance; fifty-eight of these pillars are entire; there must have been many more, as it appears they went quite round the court, supporting a most spacious double piazza. The walks on the west side of this piazza, which face the front of the temple, seem to have been grand and spacious; and at each end are two niches for statues at length, with pedestals, borders, supporters, canopies, &c. carved with imitable art. The space within this once beautiful inclosure, is (or rather was) encompassed by another row of pillars of a different order, fifty feet high; sixteen of which are yet stand-

ing. The temple was ninety feet long, and about fifty feet broad; its grand entrance on the north side, the remains of it, to have been the most magnificent in the world. Over a door-way in the remaining walls you see a spread eagle, as at Balbec; and on the front are the figures of Cupids, as well as of eagles, most finely in nature, on large stones mouldering on the earth. Nothing of the temple stands but the walls, the window-places of which are narrow at top, but richly adorned with sculpture. In the middle is a cupola, all one solid piece. Leaving this court and temple, your eyes are lulled with a great number of pillars of marble scattered for near a mile. To the north you have a stately obelisk before you, consisting of seven large stones besides its capital, grandly sculptured; it is more than fifty feet high, and is twelve feet and a half in circumference just above the pedestal; and it is imagined a statue once stood upon it. East and west of this, at the distance of about a quarter of a mile, is another obelisk, that is supposed to have corresponded with the first, and, according to the fragment of a third, it should seem that there was a continued range of them. On one of them, which is about forty feet high, there is a Greek inscription commemorating two patriots; and about an hundred paces from it is a large and lofty entrance, leading to a grand piazza, adorned with marble pillars, on most of which there are inscriptions. A little farther, onward to the left, are the remains of a stately pile of remarkably fine marble, twenty-two feet long. On the west side of the piazza are several openings, for gates; two of them appear to have been the most superb that ever captivated the human eye, both in point of grandeur of work in general, and the beautiful porphyry pillars with which they were adorned. Eastward of the piazza are a great number of scattered marble pillars, most of which have been deprived of their elegant capitals. A little ruined temple lies mouldering at a short distance, which appears to have been a very curious structure. But of all the venerable remains, none more attract the admiration than the magnificent sepulchres, towards the north of the city, extending a mile and more, and which at a distance have the appearance of tops of decayed churches, or battions of ruined fortifications."

The magnificent city of Palmyra is mentioned, in the Arabic translation of the Chronicles, as subsisting before the days of Solomon; but John of Antioch, furnished Malala, says that it was built by Solomon, and on the very spot where his father slew the Philistine chief; he affirms that the city was built in commemoration of that memorable action.

Let us apply ourselves to such historical authority as we can any where meet with, and such as may merit quotation from its character or veracity. We find, in the ninth chapter of the first book of Kings, and the 8th of the second of Chronicles, that Solomon erected a city in a wilderness, and called it Tadmor: and we are informed by Josephus, in the first book of his Antiquities, that some time afterwards the Greeks and Romans distinguished it by the name of Palmyra, even while its first name was still retained by the Syrians: and this is confirmed by St. Jerome, who tells us that Tadmor and Palmyra are the Syrian and Greek name of the same place; and the country Arabs, even at this time, call it by the former name. In this circumstance they are remarkably particular, preserving the ancient denomination of places through various revolutions. Thus the Acca of the Old Testament is at this day called by them Acca; and the Greek names Ptolemais, in which that of Acca was for some time immured, is lost through disuse. Not that human judgement can pretend to advance, however, that Palmyra was actually the work of Solomon: an opinion only can be offered, concurrent with that of the present inhabitants, who, among many other particulars, point out the wife man's fragility, the tomb of his favourite concubine, &c. &c. and say, All these things were done by Solomon the son of David. However, such structures as might have been erected by Solomon, we will suppose to have been entirely demolished by Nebuchadnezzar, who in his march to the siege of Jerusalem destroyed this city, as we are assured

by John of Antioch. For it is almost improbable that buildings, so elegantly grand, could be prior to the footing of the Greeks in Syria; and taking this for granted, we must not be surprised that Xenophon takes no notice of it in his retreat of Cyrus the younger, though he is minutely exact in his description of the desert. Neither must we express the least amazement that it is not mentioned by Alexander, who also crossed the desert in his road to Theophrastus on the Euphrates. From its situation between Antioch and Seleucia, and its being a strong barrier against the Parthians, one would be apt to conjecture that it was founded by some of Seleucidæ; though nothing of it is to be met with in history; and yet no time is more proper to make enquiry about it than from the demise of Alexander to the reduction of Syria to a Roman province. That the æra of Seleucus was used at Palmyra is proved by many inscriptions; whence it may be inferred that the place submitted to Alexander, and was for some time governed by his successors; but this evidence could not be looked upon as absolute testimony if not strengthened by collateral facts; for it might with reason be said, that the natives of Palmyra used the æra of the Seleucidæ only, as common with their neighbours. We are told by Appian that Marc Anthony attempted to plunder this city, and that many of the natives made their escape by crossing the Euphrates.

We do not find that Palmyra is taken any notice of even when Pompey reduced Syria to a Roman province, and when a taste for the liberal arts began to be prevalent.

Appian, when he speaks of Marc Anthony's visit to Palmyra, says, "At this time the Palmyrenes were merchants; they supplied the Romans with the commodities of Arabia and the Indies; and his real motive for attacking them was to enrich his troops: though, to give his conduct the colour of justice, he asserted that they had broken the neutrality subsisting between the Romans and the Parthians."

Pliny, speaking of this noble city, says, "Palmyra, which is on all sides encompassed by an extensive desert, and totally separated from the rest of the world, has preserved its independence between the two great empires of Rome and Parthia: it is distant from the Parthian Seleucia on the Tigris three hundred and thirty-seven miles; from the highest part of the Mediterranean two hundred and three; and from Damascus one hundred and seventy six; the soil is rich, and it is pleasantly watered."

The streams, of which we have before spoken, may with great truth be said to "pleasantly water the place," being capable of receiving any direction to nurture the soil.

As the Palmyrenes, according to Appian, were merchants, and a wealthy people in the time of Marc Anthony, their riches and trade must have been of some standing.

Palmyra, according to the coins of Caracalla, was in that Prince's life-time a Roman colony; and by some antique inscriptions we discover, that the people joined Alexander Severus against the Persians.

The greatest figure Palmyra ever made in history, was in the reign of Gallienus; under whose shameful indolence the Roman glory in the east became considerably obscured: when Odenathus, joining that emperor's party, collected the poor remains of the discomfited Romans in Syria, whom he led against Sapor the Persian monarch, put his army to flight, and advanced with his victorious troops to Ctesiphon, the capital of the empire. On his return from this expedition, full of riches and honours, and revered by the Romans as their saviour, he was unanimously proclaimed Augustus, and co-partner in the empire with Gallienus.

Such of the accounts of Odenathus as have reached posterity, serve rather to heighten than gratify the human curiosity. He was a native of Palmyra, and so admirable a politician, that he for a while held the balance of power between the empires of Persia and Rome. He drove the Goths out of Asia Minor, where they had committed the most violent ravages: and this was his last great action, in which, it was apprehended, he was treacherously slain by Mæonius his kinsman. His son,

Herodes, soon afterwards suffered the same fate: nor did Mæonius long survive, being cut to pieces by the soldiery.

The fortune of the beautiful Zenobia, queen of Odenathus, is well worthy the attention of our readers.

The vicissitudes which this lady experienced were various and surprising, her character great and extraordinary; though her memory is tarnished with the suspicion of her having been privy to the deaths of her husband and son.

The person of Zenobia was graceful and genteel; her complexion dark brown; her eyes black, sparkling with uncommon lustre; her teeth beautifully white; her countenance sprightly; her air noble, and her voice clear and powerful. Her strength was unusually great; she injured herself much to fatigue, was fond of riding, and would sometimes march on foot at the head of her troops. In council she was circumspect and prudent; in executing, bold and determined: she could be open or reserved, mild or severe, as occasion required; she was generous, but not profuse, and observed inviolably the chastest rules of female honour.

No woman was better acquainted with history than this accomplished queen: she was mistress of the Greek and Egyptian tongues, as well as of the Latin, which she translated into the former. She boasted herself descended from Ptolemy, and reckoned Cleopatra among her ancestry.

That Zenobia attended her husband in the field there is not the least doubt, since the emperor Aurelian passes the highest encomiums on her military prowess.

She assumed, after the death of Odenathus, the reins of government in the name of her children, and, renouncing all alliance with Rome, attacked, and totally routed the army of Heraclianus, the Roman general, who was sent against the Persians, he himself narrowly escaping from falling into her hands. She afterwards, while the exigency of public affairs called the attention of Claudius nearer home, asserted an hereditary right to the dominion of Egypt, as being descended from Ptolemy; and having secured a strong party there in her favour, she sent thither Zabdas, a gallant officer, who had served under Odenathus; and he, defeating the Egyptian army, possessed himself of the province in the name of his queen.

The Palmyrenes, however, were afterwards routed, and nearly driven from their new acquisitions, but taking advantage of Probus, the Egyptian prefect, who in endeavouring to cut off the retreat of the vanquished, discovered his ignorance of the country, they totally defeated his army, and himself was taken prisoner; a disgrace which he could not outlive; but, dying by his own hand, left Zenobia mistress of Egypt.

The progress of this heroic queen greatly alarmed Claudius, who being now near the end of the second year of his reign, resolved to turn his forces against her, but was cut off by the plague at Syrmium in Pannonia. He was succeeded by Aurelian, who was not, however, secured in his power without some trouble, and who, before he thought of relieving the eastern empire, reformed the police at Rome, and reduced the Goths, Vandals, and Germans. These great tasks being completed, he crossed the Bosphorus at Bizantium, and having taken Tyana in Cappadocia, he proceeded to Antioch, of which he possessed himself by stratagem. By two battles, one fought here, the other at Emesa, Aurelian recovered the eastern provinces, and forced the queen to shelter herself within the wall of her capital.

We are not acquainted with the reasons of Zenobia for renouncing her alliance with the Romans; but perhaps she will be excused for the breach by such who consider the character of Gallienus, whose vices were numerous. How different a character was Claudius his successor!

But to return to Aurelian. This monarch having taken every necessary precaution to supply his army with provisions, proceeded to Palmyra, not however without being considerably harassed by the Syrian banditti. Arriving at length before the walls of the city, he laid close siege to it, and was gallantly resisted by the garrison. Being wearied out with military operations, the emperor had

had recourse to negotiations, and made some offers to Zenobia, which she most haughtily rejected, bidding him remember that her ancestor Cleopatra preferred death to dishonour. This enraging Aurelian, he re-attacked with redoubled vigour; and the besieged being at length reduced to the last extremity, had no resource but that of applying to their allies, the Persians, for relief; and this resolution being agreed on in council, Zenobia herself undertook the carrying of it into execution, and, mounting a dromedary, set out for Persia; but was taken prisoner as she was about to cross the Euphrates.

Palmyra now soon surrendered, and the emperor took possession: he spared the inhabitants, but carried off the best part of their riches, leaving behind him a garrison of six hundred archers, who, some years after, were cut off by the inhabitants, most of whom were, by the emperor's command, in consequence of the massacre, put to death, and the city quite ruined.

The emperor, at Emesa, set on foot an enquiry into the conduct of Zenobia; and here, alas, it was that she fulfilled her great character by betraying her best friends, among whom was Longinus, by whose advice it was that she had rejected the terms of peace which the emperor Aurelian had proposed: for this he was ordered to be executed; but his mistress was reserved to grace a Roman triumph. She afterwards married, and had children at Conche, on the road from Rome to the ancient Tiber, where the emperor assigned her some

lands, and the remains of her villa are at this day to be seen.

Palmyra was afterwards governed by the Romans; and, from a Latin inscription still extant, we discover that Hierocles was for the fifth time president of the provinces, when Dioclesian here erected some magnificent edifices. In the year of Christ four hundred, the first Illyrian legion was quartered here; but Procopius gives us reason to imagine that the place was so little regarded, as to be sometimes left without a garrison. The Roman history makes no farther mention of Palmyra.

There were two thousand Jews among the inhabitants of Palmyra in the twelfth century, according to Benjamin Tudulensis, a superstitious Jew traveller.

We shall conclude our account of this once grand and flourishing city, in the following quotation from an author on the subject:

"That Palmyra was used as a place of strength, is evident, from alterations which have been made in the castle on the hill, and the TEMPLE OF THE SUN, which must have been intended for defence, and are not more than five or six hundred years old. The most perfect piece of antiquity is a mausoleum, upwards of seventeen hundred years old, with the flooring entire, and an inscription still legible, informing us that it was built by Jamblicus, son of Mocimus, as a burial place for himself and family, in the year 314, which answers to the third year of the christian æra."

CHAP. IX.

TURKEY, in ASIA.

SECT. I.

Of Turkey in general; its Situation, Extent, Divisions, Mountains, Rivers, &c.

WE now enter upon the description of some of the finest provinces in the universe, which are in the possession of the most indolent people existing. The land here produces more spontaneously than other places do by cultivation; but the superstitious notions, and absurd customs of the people, prevent their enjoying the half of those blessings with which Providence hath enriched their country. They are slaves to the tyranny of the government, and to their own passions, and take more pains to be luxuriously idle than more active people do to be profitably busy. The religion and political constitution of the country obliges them to innumerable absurdities, while their inclinations impel them to seek all manner of indulgences. Their lives, are therefore an odd jumble of morality and libertinism, of self-denial and excess.

Turkey in Asia forms a grand division of the Turkish empire, the whole being nearly square, and extending about two thousand miles each way. It abounds not only with the necessaries, but with all the luxuries of life, and contains some of the most fertile and delightful provinces in the universe.

Turkey in Asia, of which only we shall at present treat, is situated between 23 and 48 deg. of north latitude, and 27 and 45 deg. of east longitude. It is divided into eastern and western: the latter comprehends Syria, Palestine, and Anatolia, or the lesser Asia; and the former Diarbeck, Turcomania, and Georgia.

This country is perhaps the best situated for navigation of any in the universe, but the natives do not know how to make use of the uncommon natural advantages

with which Providence hath blessed them. The seas which border on it are the Euxine, or Black Sea; the Bosphorus, or sea of Constantinople; the Propontis, or sea of Marmora; the Hellespont, and the Ægean Sea, or Archipelago, which divide Asia from Europe; the Levant, or White Sea, and the Persian Gulph. The Red Sea likewise divides it from Asia, which occasions the Grand Seigneur, among his other titles, to stile himself "Lord of the Black, White, and Red Seas."

The mountains, which are many, have been the most celebrated in sacred and profane history of any in the universe: the principal, which are situated in Lesser Asia, are Olympus, Ida, Tauris, Anti-Tauris, and the Carmanian mountains. Besides these are mount Caucasus, or the Daghestan mountains; mount Arrarat, where the ark rested, and the other Armenian mountains; the mountains of Kurdistan, and Palestine, particularly mount Hermon and mount Lebanon.

The principal rivers are the Euphrates, Tigris, Meander, Orontes, Sarabat, Jordan, Haly, and Kara.

The Tigris and Euphrates rise in the north, and flowing towards the south-east, enclose and fertilize that delightful part of Diarbeck, the ancient Mesopotamia, which is supposed to have been the seat of Paradise. The Orontes rises in mount Hermon, and running north westward, empties itself into the Levant sea. The Meander, which rises in mount Tauris, flows westerly till it falls into the Archipelago; from this river all winding or serpentine streams are called Meanders. The Sarabat rises in Natchia, and discharges itself likewise into the Archipelago. Haly rises in Cappadocia, and runs into the Euxine sea. Kara takes its rise in Natchia-Propet, and falls into the Euphrates. Jordan is formed by the union of two streams, named Jor and Dan, which rise at the foot of Anti-Libanus; it emp-

ties itself into the Dead sea, but is only a small river. It forms two lakes; the one called Merom, is very small, and dry in summer; the other called the sea of Gallilee, or lake of Tiberias, is near thirteen miles in length, and five in breadth. It was in the sea of Gallilee that St. Peter, Andrew, John, and James, exercised their profession as fishermen.

As this part of Turkey is very extensive, the climate and natural productions greatly differ; we shall therefore give a particular description of every province, in order to avoid general assertion, which can only be true in part, and begin with the province of Georgia, or Gurgistan.

S E C T. II.

Of Georgia, Mingrelia, Imaretta, Abcassia, and Comania.

GURGISTAN, or the country of Georgia, (for the termination *Tan* is a Celtic word, and signifies country) is bounded on the north by Circassia, on the south by Armenia; on the east by Daghestan, and on the west by the Euxine or Black Sea; it includes Colchis, Iberia, and Albania.

Georgia, which is partly subject to the Turks, and partly to the Persians, abounds with mountains and woods, which are interperched with a variety of beautiful vales, and fertile plains.

Georgia has a dry air, cold in winter, and hot in summer. It produces all kinds of fruits, which are excellent, and the bread is hardly to be paralleled. There is plenty of fine cattle: the pork is admirable, the wild and tame fowl incomparable, and the fish, both sea and river, equal any in the universe.

The inhabitants have better, and drink more wine than any other people in the world: a horse-load of the best, which is about three hundred weight, sells for only eight shillings. The country likewise produces great quantities of excellent silk. Sir John Chardin says, that the Georgians are "robust, valiant, and of a social temper, great lovers of wine, and very trusty and faithful, endowed with good natural parts, but for want of education vicious. The women are generally so fair and comely, that the wives and concubines of the king of Persia and his court, are for the most part Georgian women. Nature has adorned them with graces no where else to be met with. It is impossible to see them without loving them; they are of a good size, clean limbed, and well shaped." Some modern travellers of reputation, however, assert, that the above, and many other accounts of the extraordinary beauty of the Georgian women are greatly exaggerated, and proceed more from fancy than real observation. It is certain that the women of all the surrounding nations are exceedingly disagreeable in their persons and features, and perhaps the Georgian women owe their reputation for beauty more to the ugliness of their neighbours than to their own real intrinsic charms. It may not be improper likewise to observe, that in countries where multitudes of fine women are continually seen about the streets, with their faces uncovered, beauty is less regarded and noticed than in those places where females are generally locked up, and always veiled, and their persons or features rarely visible. We always entertain a greater idea of that which we seldom or never see, than of what we are intimately acquainted with.

^a Beauty soon grows familiar to the lover,

^b Fades in his eye, and pulls upon the sea."

The reason is plain, the mental faculties are more lively than the corporeal ones, and the fancy exaggerates more than the sight. Thus the imagination forms beauties which the eye cannot see, and bestows graces which actual observation cannot trace, while the passions intersting themselves in the sensual idea, overpower the reason, and engage the heart to imagine what never existed. Hence these captivating Chastities, as they are deemed, are more obliged to their exclusion from promiscuous society, and to the foil of their neighbours uncommonness, than to any extraordinary gifts of nature to themselves.

Georgia formerly contained many large cities, as history informs us, and thir ruins evince: but at present there are but few cities and towns in proportion to the uncommon fertility, and great extent of the country, and those few are but thinly inhabited, which is perhaps owing to the barbarous custom of selling the juvenile inhabitants for slaves, for the lords sell their tenants and vassals, parents their children, and masters their servants, as they think proper. The principal factors in this unnatural business are Jews, who purchase the boys and girls when very young, give them a suitable education, and when they arrive at a proper age, dispose of them to the Turks and Persians, by whom they are employed in their armies and seragios as concubines, slaves, mutes, eunuchs, soldiers, &c. and many have been raised to the rank of Rasclemen.

In defence of the above-mentioned custom, the Georgians plead, that it is for the benefit of their children; for if they stay in their native country, they are sure of being hard working slaves, but when they are sold they are more cared for, live better, do less, and have a greater chance of advancement than they could have at home. Many of both sexes indeed, who have obtained the favour of the great, both in the Ottoman and Persian courts, have had interest sufficient to send for their parents and relations, and get them promoted to places of great trust and importance.

The Georgians are great liars, implacable in their hatred, and unforgiving to those who have offended them. They do not deem drunkenness, luxury, or libertinism crimes, or even follies. The clergy in general are worse than the laity, and the women are as vicious as either. They hurt their beauty with paint, and their minds by the most licentious behaviour. They are all usurers, and affect a grave deportment. All religions are tolerated in Georgia, every one being at liberty to think, pray, and speak as he pleases. Many individuals of the surrounding nations reside here, and the Armenians in particular are more numerous than the Georgians themselves. They are likewise richer, and occupy the principal places of trust and power.

Their houses are all built after the model of the Persian houses; they likewise imitate them in eating, sitting, lying, &c. they have buttons and loops to their vests, and wear them open at their breasts. The habits of the women are entirely Persian; the men covering for the legs and feet in the Persian fashion, but their bonnets or hats resemble those of the Poles.

The Georgian nobles are all tyrants, and exercise the most despotical cruelty over their vassals and dependants, whose properties, liberties, and lives, they think at their option.

The sovereignty of the Turks and Persians over Georgia, is rather nominal than real, for as they are a hardy warlike people, and can easily retire to and defend the passes of their mountains, it would be dangerous to quarrel with them, as no army could subdue them, and from the nature of their country, they might become exceeding troublesome by making incursions into the neighbouring Turkish and Persian provinces.

Though the prince of Georgia is a Mahometan, the generality of the people are Christians, or at least pretend to be so, for they are so extremely ignorant, that they scarce understand the meaning of what they profess. Sir John Chardin mentions an absurd custom which prevails in this country, the reason of which he could never find out, that is, the building their churches upon high, and almost inaccessible places, where they are abandoned to the injuries of the weather, and suffered to be the habitations of birds. From their situation, the Georgians can see them at a great distance, when they never fail to salute them with great respect, but take care seldom or never to enter them. In some of the towns, however, the churches are kept pretty decently. Besides the patriarch there are several bishops, and a great number of inferior clergy.

Some of the Georgians, who have more decency and conscience than their neighbours, follow the Armenian custom of marrying their daughters when infants, to prevent their being sold for slaves, or taken away by the great lords as concubines.

The

The only considerable and fortified towns in Georgia are four in number, viz. Teflis, Gory Caket, Zagan Suram, and Aly; and the principal rivers are the Kur or Cyrus, and the Aragus; the first rises in the Moschian mountains, and discharges itself into the Caspian Sea; the latter springs from the mountains, which separate Iberia from Colchis, and falls into the Cyrus.

Teflis, the capital of Georgia, is one of the best cities in the oriental regions; it is watered by the river Kur. The walls are strong and handsome; it contains fourteen churches, six belong to the Georgians, and eight to the Armenians: the cathedral, called Sion, is a stone church, built near the river. A large dome, supported by four massy pillars, rises in the middle, the inside is filled with miserable Greek paintings; and adjoining to it is the bishop's palace.

On the declivity of the mountain there is a large fortress, containing an arsenal, a market, and a public square. Here is not a single mosque, which is rather particular as the city belongs to the Persians, and the prince himself hath usually been a Mahometan; but prince Heraclius, who is supposed to reign in Georgia at present is a Christian, and we have been informed hath attempted to throw off both the Turkish and Persian yoke, and to prevent the inhabitants from selling their progeny as slaves; how far his laudable endeavours have been successful we cannot pretend to say; but hope, from the Turks having been engaged in an important war with the Russians, and from the prevailing distractions in Persia, that he hath been able entirely to render himself independent of the infidels.

The Georgians use bells in their churches, sell pork in the markets, and vend wine in the streets. The Bazaars, Caravaneras, and some of the houses are built of stone, but the generality are only erected with mud and bricks, and are low and dark. The streets are very badly paved, and consequently disagreeable either in wet, or dry weather. The palace of the prince is a superb building; it is adorned with extensive and beautiful gardens, aviaries, falconries, &c. and before it there is a large square surrounded by shops. Teflis is situated in 42 deg. 47 min. north latitude, and 47 deg. 5 min. east longitude. It is very populous, the staple commodity is furs, but great quantities of raw silk are sent to various places, as the Georgians know nothing of weaving. The inhabitants of the city are thought to amount to about 20,000. Many tolerable houses, and fine gardens, render the environs very pleasant for several miles round.

The principal amusement of the inhabitants of Teflis is bathing: the baths are agreeable places, and contain fine springs, some hot, others cold, and others lukewarm. The Grand Vizir's house is the finest in the city, and the Capuchin's monastery is pleasant; these Italian fathers receive from Rome annually but 25 Roman crowns each to maintain them; but they are permitted to practise physic, of which they know very little. If the patient dies they receive no pay; if he recovers, slaves, wine, cows, sheep, &c. are sent to the convent, by way of gratuity. The Georgians have no manner of notion of taking money, but love to deal by way of barter; travellers have therefore an opportunity of procuring the most excellent provisions in great quantities, in exchange for trifles, such as necklaces, rings, bracelets, knives, pins, needles, &c. they use neither weights or measures, and are such bad arithmeticians, that they cannot count an hundred.

In Georgia, a merchant is less respected than a mechanic; and a mechanic less than a husbandman. The principal merchants and traders are Armenians, whom the Georgians naturally hate, and look upon in the same despicable light as Jews are considered in Europe. One of the most respectable employments in Georgia is that of a public executioner. The profession is deemed respectable and honourable, and the professors are all rich; if any man can trace a hangman amongst his ancestors, he is extremely proud of it, and never fails to mention it frequently with exultation: at the same time observing that nothing is so noble as executing justice, and that the safety of the state depends on the extermination of criminals.

With respect to Turkey and Persia, Georgia is in much the same predicament as Flanders is in Europe; for, when a war happens between those empires, this country is usually the seat of it. In 1578, the Turkish forces under the command of Mustapha Bassa took Teflis; but the Persians coming to the assistance of the Georgians, the Turkish troops were defeated, and 70,000 of their men were slain in the battle. In 1583, hostilities were re-commenced, but the Turks were again unsuccessful.

The prince of Georgia, besides what is usually allowed him by the emperor of Persia, has the customs of Teflis, the duties upon brandy and melons, and one sheep for every fire-hearth in the whole country, which amounts to 40,000 sheep; the crown estates supply him with wine, butter, wax, grain of all kinds, vegetables, fruits, &c. A great deal of gun-powder is made in Georgia, particularly at Teflis, the mountains near that city producing large quantities of nitre. The people eat and burn a great deal of linseed oil, which they have in great plenty, but they value only the seed, as they have no idea of beating the stalk for spinning.

When a Georgian dies, a bishop says mass over the corpse, for which he receives a hundred crowns. If the deceased has not left money sufficient to discharge this exorbitant demand, some of his quondam friends very obligingly sell his wife and children for slaves, to raise the money; for the clergy must not go unpaid: the bishop then says mass, and afterwards lays a letter upon the breast of the corpse, which is only a complimentary card to St. Peter, to inform him that the funeral expences have been honestly paid, and to entreat him therefore to be so obliging as to open the gates of paradise to the deceased; the body is then wrapt up in linen and buried. The Mahometans here have the same absurd custom of sending a note by the dead to Mahomet.

The Georgian men are usually more ignorant than the women; for the girls in general are brought up in monasteries, where they learn to read and write. If any of the girls chuse to become professed nuns, they are authorized to baptize and apply holy oil.

The language of the Georgians is remarkable for its beautiful simplicity. Father Lami in his art of speaking, mentions it in the following words, "all the names derived from the primitives differ only in this termination, *jani*. If they are names of dignity, offices, or any art, the derivatives add *me* to the primitives. By placing the syllable *ja* before the name of a thing, they form a derivative, which denotes the place of it, thus *thradi* signifies a dove, and *fatbradi*, dove-house; *chushi*, cheese; and *schushi* the place where it is kept."

Many travellers, particularly the ingenious Monsieur Tournafort, insist that the terrestrial paradise, where Adam and Eve first received being, was in Georgia. The latter gentleman says, "it cannot be doubted but that Paradise must have been in the way between Erzeron and Teflis, if it be allowed to take the Phasis for Pison, and Araxes for Gihon, and then not to remove Paradise too far from the heads of these rivers, it must of necessity be placed in the beautiful vales of Georgia. And if we may suppose the Terrestrial Paradise to have been a place of considerable extent, and to have retained some of its beauties, notwithstanding the alterations made in the earth at the flood; and since that time, I do not know a finer spot to which to assign this wonderful place." He again says, "as to Palestine, where some would persuade us that Paradise lay, to me it seems trifling, to attempt to make four rivers of Jordan, which is itself but a brook or rivulet, and besides, this country is very dry and rocky."

The western parts of Iberia or Georgia, which the moderns call Mingrelia, but which was known to the ancients by the appellation of Colchis, is bounded on the east by Georgia, properly so called; on the west by the Euxine sea; on the north by mount Caucasus; and on the south by Armenia and part of Pontus.

Mingrelia is watered by many rivers, viz. the Corax, Hippus, Cyaneus, Charifus, Abfarus, Cissa, Ophis and Phasis, where the Argonauts landed. All the

A a

above

above rivers empty themselves into the Euxine sea, but none of them are considerable, except the Phasis, which rises in mount Caucasus. The inhabitants of this celebrated mountain are said by the most authentic writers to have little besides speech, which can entitle them to humanity; they are tall and well made, their looks are fierce, and indicate the savage disposition of their minds. They are in fact the most daring, ferocious, and determined robbers in the world.

The country in general is extremely woody, very uneven, full of hills, and but little cultivated; the soil is bad and sterile, the fruits are all ill tasted and unwholesome, except the grapes, which might be converted into some of the best wine in the universe, if the natives did but know how to make it. Rains almost continually fall, which occasion such a quantity of humid vapours to mingle with the hot exhalations natural to the climate, that pestilencies, and a variety of other diseases afflict the natives almost continually. The earth is so moist that the few who turn their thoughts to agriculture, sow their wheat and barley without ploughing; and for their other seeds, they turn up the land with little wooden ploughs, which are sufficiently strong to make furrows in so soft a soil. Colchis was said by the ancients to be exceeding pleasant and fertile, and even to abound in mines of gold, which gave rise to the celebrated fable of the golden fleece, and the Argonautic expedition; for the inhabitants used to catch the gold dust, which was brought down by the torrents from mount Caucasus, by setting fleeces of wool across some of the narrow passages of those torrents.

The country abounds in beeves, hogs, wild boars, stags, and other venison: likewise in partridges, pheasants, quails, &c. On mount Caucasus, falcons, eagles, pelicans, tigers, lions, leopards, wolves, and jackalls breed.

Their bread is made of a small grain, called gomm; it is agreeable to the taste, salubrious, cooling, and laxative. The people of quality, however, eat wheaten bread, not that they like it better, but because it is more scarce. The principal food is beef and pork, the latter being excellent. The nobility spend a great deal of time in killing and catching game, such as pheasants, water fowl, &c. but their favourite diversion, is flying the falcon at the heron; which is no sooner taken than they cut the beautiful tuft of feathers from its head, and let it go again. They have a great number of excellent horses, which are never shod, nor fed with corn.

The country is every where interpersed with houses, but there are no towns, except two little ones by the sea side. With respect to castles there are about ten in number, in the principal of which, named Ruc, the prince keeps his court. Their castles are built of stone, to the height of about fifty feet, in the midst of a wood. Here their treasures are deposited, though the garrison consists of only about sixty persons; near the castle are several magazines for provisions, built of wood, which likewise serve for places of retreat upon emergencies. They have many huts made of branches of trees, canes and reeds; and are so secure in these retreats, that none can come at them, but by one winding narrow passage, which is always stopt up when they apprehend an attack.

As the Mingrelians have great plenty of timber, they build their houses of wood, but never raise them above two stories. They have neither windows nor chimnies, but are furnished with beds and couches; at night, not only the whole family, but the cattle all lie in one room.

The men are well proportioned, and the women pretty, but they paint their faces and eye-brows; they wear their hair in curled ringlets, are witty and polite, but vain, luxurious, treacherous, and ferocious; dextrous thieves, and glory in theft. They think it prudent, as well as lawful, to have many wives, because they bring them many children, whom they can sell for money, or barter for necessities; when children, however, come too quick, they do not hesitate to murder them. They likewise murder the sick and aged, and pretend they do it with the benevolent design of putting them out of their misery; adultery is thought

but a trifle: when a man catches another in familiarity with his wife, he obliges him to pay a hog, which is immediately dressed, and all three sit down very lovingly to feast upon it.

The lords not only compel the peasants to maintain them, but sell them and their whole families whenever they think proper. They are the umpires in all disputes between their vassals; but when there is a quarrel between any of the great lords, they have recourse to arms. Their weapons are bows, arrows, swords, and lances.

The ecclesiastics have long beards, but the laity suffer very little of their beards to grow. They shave the head leaving only a little hair upon the forehead and round the ears. Their bonnet is made of felt, and in winter is lined with fur, but is not of much use to them, for when it rains, they put it in their pocket, and go bareheaded to face it. They are so poor that the common people go almost naked, and have only a covering of a triangular form, which they turn against wind or rain. They wear a shirt, but have seldom more than one at a time, and that they only wash three times in the year. The shirt is tucked into a pair of breeches, and on the feet they wear sandals made of the untanned hide of a buffalo, which are fastened with thongs of the same. In winter they wear snow shoes.

The whole of every family of both sexes eat together. The grooms and scullions dine daily with the king and queen. On holidays they eat venison, beef and pork, but at other times the masters have fish and pulse, and the inferiors nothing but gomm. If the weather will permit they dine in the open court. Both sexes usually get drunk at their entertainments, when the men boast of their theists, and the women of their debaucheries.

The continual sale of the Mingrelians to the Turks, and Persians, and their perpetual squabbles among themselves, have greatly depopulated the country. The revenues of the prince are estimated at about 20,000 crowns per annum, which are raised by taxes, impositions, the sale of slaves, and duties on all imports and exports: of this money he spends very little, for his crown lands are more than sufficient to maintain him, and the people are obliged to work for him for nothing. His forces are principally cavalry, and do not amount to above 4000 effective men. Every lord leads his own people to battle, but they are so badly disciplined that they march, charge, and retreat without order. All commerce is carried on by barter, though they have money which bears the Persian stamp; but is coined in Georgia; the value of which is always fluctuating.

The Mingrelians profess themselves Christians, but are exceedingly ignorant in all religious matters; few of the clergy can either write or read, but they greatly impose upon the laity, by pretending to divination. Most ecclesiastical writers say that a Christian slave converted these people in the reign of Constantine the Great; but the Mingrelians themselves attribute that work to St. Andrew, whom they affirm came and preached among them, at a place called Piguias, where there is at present a church. The head of their religion is called Catholicos, who is obliged to go once in his life to the above-mentioned church to make holy oil.

When a Mingrelian is sick, a priest is sent for, not to pray by him, but to predict whether he will live or die. Having opened a book he looks gravely in it, though he is unable to read a line; then shutting the book suddenly, he declares that the patient will inevitably die, unless a very handsome present is made to himself. The sick person being greatly terrified entreats the priest to take what he pleases. The conscientious clergyman does not want twice bidding, but packs up whatever he can lay his hands upon, and drives away all the poor man's cattle into the bargain; thus do these superstitious people suffer themselves to be plundered by their ignorant clergy.

The Catholicos is allowed by the government 400 vassals, who are obliged continually to work for him, that he may be supplied with whatever he wants. In return for their labour he does not give them any pay, but takes away their wives, and sells their children for slaves.

slaves. Sometimes he makes a tour through his whole diocese, which extends not only all over Mingrelia, but throughout Imeretia, Gurjel, Abca, and Mount Caucasus. In these excursions he does not attempt to regulate the pastors, or instruct the people, but plunders and robs both clergy and laity of all he can lay his hands on. Indeed, if he was willing to teach his inferiors he could not, for most Catholics have been so ignorant as scarce to know how to spell their own names. The Catholics has six bishops immediately under him; and these heads of the church absurdly make the whole Christian religion to center in one article, that is, the abstaining from eating of flesh. They neither preach nor pray; their most important business being to get drunk daily: the inferior priests copy their superiors; and the people in general think they cannot do better than to imitate the clergy. It is no wonder, therefore, that the Mingrelians have been deemed by travellers some of the wickedest wretches upon the face of the earth. Sometimes, after the priests have with impunity defrauded the people, and the Catholics have robbed both, the prince takes it into his head to depose and plunder the Catholics.

The cathedral is a tolerable building, and the images within are finely adorned with gold and jewels. The superior clergy wear long beards, black bonnets, and robes of scarlet and velvet; but those of the inferior class make but a despicable appearance, and are obliged to work for their great lords as hard as the laity. The generality of their other churches are as nasty as hog styes: and their images are kept very filthy, though their worship of them is exceedingly idolatrous. Having no bells, when they call the people to church, which is but seldom, they strike against a board with a great stick. They pay the greatest respect, and make the largest presents to those Saisas who have the character of being the most cruel and savage. St. Giobas is their greatest favourite; because they think that he would kill all who came near him, they therefore only peep at him at a distance, and lay down their presents. Their mass is after the Greek manner, with this difference, the Greek priests repeat the whole perfectly, but the Mingrelians only mumble the ceremony, and blunder at every other word. For their chalice they have a wooden bowl, and a wooden dish for their patten. They consecrate both leavened and unleavened bread, and drink the wine without its being mixed with water.

They baptize by immersion; and as soon as the child is christened, priests, parents, godfathers and guests, indulge themselves in gluttony and intoxication to the greatest excess. When a man wants a wife, he must buy her: a tolerable good price is given for a virgin, less for a widow, and least of all for a woman who has been divorced. When the nuptial contract is made, the couple may cohabit together previous to the payment of the money. They may also divorce their wives either for barrenness or ill-nature.

They keep their dead forty days above ground, during which time they mourn. At first, they make a terrible howling and screaming, tearing their cloaths all into tatters, beating their breasts, scratching their faces, and pulling off their hair by handfuls; but their lamentations gradually diminish, till the fortieth day, when the body is buried: an entertainment is made, the most extravagant mirth is encouraged, and the mourners get drunk in order to forget the deceased. When any of the laity die, a bishop always performs the funeral service, and then lays claim to all that belonged to the deceased; but when a bishop dies, the prince himself lays mass, in order to have the privilege of plundering his house. Thus a burial is generally the ruin of a whole family.

The Mingrelians, when they eat pork, or drink wine, make the sign of the cross, for which none of them can give the least reason. All their prayers are addressed to their saints, to whom they sacrifice, and their greatest festivals are when these images are carried about in procession, in order to get money from the people. At Christmas and Easter, they do not work, but labour all the rest of the year, for they observe no Sabbath. They keep the four great lentils like the Greeks, viz. 48 days before Easter, 40 days before Christmas, St. Peter's fast,

which holds a month, and the fast of the Virgin Mary, which lasts 15 days.

In Mingrelia are some monks of the order of St. Basil. They observe the fasts with great punctuality, but are very little solicitous about any other points of religion. They suffer their hair to grow, eat no flesh, and wear black bonnets. There are nuns of the same order, who are neither confined to any particular place of residence, nor restricted by any vows, but become seculars when they please, and resemble nuns in nothing but wearing black veils.

In ancient times there were some cities of note in this country, particularly Pityus, Dioscurias, and Aea on the Phasis, so named from the river in which it stood; Cyta, at the mouth of the river Cyaneus, the birth place of the famous Medea, called from thence by the poets Cytæis, Saracæ, Zadnis, Surium, Madia, and Zaliffa.

There are two principalities in Western Georgia, besides Mingrelia, viz. Imeritia, or Imeretia, and Abassia, or Abcassia. They lie to the southward of Mingrelia along the Euxine sea, and the princes of both are tributary to the Grand Seignor.

Imeretia is about one hundred and twenty miles in length, and sixty in breadth; it contains many hills and woods, but the plains produce corn, cattle, pulse, &c. It is upon the whole more fertile and plentiful than Mingrelia. They have some excellent iron mines, carry on a great deal of commerce, and coin money. The principal towns are Cotatis and Akalziki.

Cotatis was the residence of the prince or king of Imeretia, but is now only the residence of a Turkish Basha. It is situated at the foot of a mountain, on the top of which there is a strong castle to command and defend it. It is watered by the Phasis; the town has no walls, and contains only about two hundred houses. It lies open on all sides, except where the rivers and mountain surround it. On the opposite side of the river, there is a citadel on an eminence, which has a double wall, and is flanked with high towers. It lies in 42 deg. 23 min. north latitude, and 43 deg. 54 min. east longitude.

Akalkiki is likewise the residence of a Turkish Basha. It is situated in a hole, surrounded by about twenty hills, in 41 deg. 55 min. north latitude, and 44 deg. 55 min. east longitude; the river Kur flows very near it. The town contains about four hundred houses; the inhabitants are a mixture of Georgians, Armenians, Jews, Turks, Greeks, &c. who have several churches and a synagogue. The houses are built of wood, and the walls and fortifications are old and ruinous.

Abcassia is the northernmost of these countries, having the Euxine sea to the south; Circassia on the west, and Mount Caucasus on the north and east. The principal traffic is in slaves; the inhabitants, however, deal in the skins of tigers, deer, &c. boxwood, honey, wax, and thread, which they exchange with the merchants who come upon the coast, for many things which they have occasion for. They were once Christians, but at present are exceedingly ignorant, and little better than savages. They go almost naked, and live in little mean low huts.

The Mamalukes, who were once so celebrated in Asia and Egypt, and contended so long with the Ottomans for superiority, were no other originally than Georgian children, who being brought up to a military life, became so powerful as to revolt against their masters, and usurp the throne of Egypt.

Most geographers include Comania in Georgia, which is bounded by the Caspian sea to the east, by a ridge of mountains which part it from Circassia to the west, by Asiatic Muscovy to the north, and by Georgia on the south: the country is thinly inhabited, and badly cultivated; but the soil is flat, low, and fertile. It is watered by several rivers, which descend from the mountains about Caucasus. The climate is rather cold, and pretty much subject to rains. The inhabitants, who are called Comani, or Kamouche, live principally by plunder. They wear Persian linen and silk, wear dress like the natives of Little Tartary: the men short jackets and drawers, and the women long loose gowns which resemble shifts. They have nothing that can be called a town

town, but their little hamlets consist of about sixty huts. Their food is milk, game, the flesh of their cattle, honey, such fruits as their country spontaneously produces, and rice, which they have from Persia.

GurIEL, a small district which appertains to Mingrelia, is too little known to admit of a description; the manners of the people, however, are said to be the same with those of Mingrelia.

S E C T. II.

Of the Daghestan, or Daghestan Mountains, Mount Caucasus, the Euxine, or Black Sea, &c.

Daghestan, Daghestan, or Dag-Estan, is bounded on the east by the Caspian Sea, on the west by mount Caucasus, on the south by part of Persia, and on the north by Circassia. The appellation itself signifies mountaineers, for Dag implies a mountain, and Stan a country: the people call themselves Daghestan Tartars, or Tartars of the mountain. They are usually accounted some of the most ferocious of all the Asiatics, and are deemed the descendants of the ancient Parthians. These people extend themselves from the capital of Circassia, for about forty leagues along the coast of the Caspian Sea.

They circumscribe their children, and use some other Mahometan ceremonies, but are stupidly ignorant with respect to religion in general. They wear coats of mail, carry helmets and bucklers, and use bows, arrows, darts, lances, and broad swords. Their faces are very ugly and tawny, and their hair black and dishevelled: their dress is a long loose gown, made of dark coarse cloth, and over this they throw a cloak made of the skin of sheep, or some other animal. Their caps, which hang down to their eyebrows, are made of various slips of cloth or fur. Their shoes are made of only one piece of skin, and are sewed about the ancles in a clumsy manner. Their food is the flesh of their numerous herds, and milk. They spare neither age, sex, or condition, but rob all alike, and even plunder their very nearest relations, whose children they sell without the least remorse. They oblige all merchants to pay them tribute, and if strong enough rob them of every thing, which occasions the caravans always to have a powerful escort. There are as many petty lords, called Myrfas, as towns. From among these a chief is selected, called Shemkal. On the death of Shemkal, the manner of election is thus: the Myrfas assemble in a ring, in the middle of which stands the priest, who throws a golden ball among them at random, and he that first touches it is duly elected. His power, however, is limited by the others, nor is he much respected. These Tartars are sometimes confounded with the Lefgee, who are a different people, though near neighbours. Tarchu, the capital of this country, is situated on the western coast of the Caspian Sea, about forty miles north of Derbent. It consists of about one thousand wooden houses, built after the Persian manner, but in a more humble style.

Mount Caucasus, which lies between the Euxine and Caspian Seas, is one of the highest mountains, or rather chain of mountains, in the universe. Innumerable fir trees are found upon it. It is full of terrible rocks, hideous precipices, dismal caves, &c. Paths have been cut through it with immense labour for the convenience of passengers, but by reason of the steepness they are difficult to pass even in summer, but in winter much more so, on account of the vast quantities of ice and snow. The highest parts are covered with snow all the year, which makes the passage exceedingly dangerous in windy weather; for the clouds of snow, when driven by a hurricane, have been known to overwhelm whole companies of men and horses. The passage quite across the mountain is about one hundred and twenty miles in extent: by the way are several villages, well supplied with provisions; for the soil of these astonishing mountains is fruitful, and produce plenty of corn, wine, fruits, honey, cattle, &c. which is principally attributed to the richness of the manure yielded by the snow. The inhabitants have store of poultry, eggs, pulse, bread, &c. They breed hogs, whose flesh is very fat and delicious. Though subject to the Ottoman Porte they call themselves Christians, but are in reality little entitled to that epithet.

The Euxine Sea was only deemed a lake by the ancients. It is by the moderns usually called the Black Sea, though Tournefort observes, that it has nothing black but the name. It extends about nine hundred miles from east to west, and about three hundred and eighty from north to south, in some parts, but is less in breadth in others. It is encompassed by Crim Tartary and Circassia on the north; Anatolia, or Asia Minor, on the south; Turkey in Europe, on the west; and Georgia, on the east.

None but the Turks are permitted to navigate this sea, though infinite advantages would redound to the Porte, if it was open to the Franks, as the Ottomans are very unskilful mariners, know little of navigation, are without charts, and do not understand the compass.

As this sea hath no communication with the Mediterranean, and receives many large rivers into its bosom, its waters are fresher and clearer than those of most other seas. The principal rivers which fall into it are the Danube, the Don or Tanais, the Nieper, the Phasis, and the Niefter. The Euxine Sea joins to the Paulus Meotis, or sea of Azoph, by the straits of Caffa, which the ancients termed the Bosphorus Cimmerius.

S E C T. III.

Turcomania, or Armenia Major, and Armenia Minor.

THE province of Turcomania is bounded on the north by Georgia, on the south by Mesopotamia, on the east by Persia; on the west by Cappadocia and the Lesser Armenia, from which it is separated by the Euphrates. It is about three hundred miles in length, and two hundred in breadth, extending from 38 deg. 20 min. to 42 deg. north latitude, and from 39 to almost 42 deg. east longitude.

This country in general is exceedingly mountainous, not but some fine dales, and pleasant vallies, are interspersed among the hills. The country, however, produces nothing without the most indefatigable industry. The inhabitants are forced to cut trenches in order to water it, and even many spots are watered by hand in the manner of gardens. But after all, every kind of grain is but indifferent. The wine is likewise bad. The cold is here very intense, and the fruit extremely backward. Snow sometimes falls in June, but the hills are covered with it all the year round. We are informed by authentic ancient writers, that Lucullus, who commanded the Roman army in Armenia, was astonished to find the whole country covered with snow at the autumnal equinox. Indeed the severity of the weather was such, that he lost abundance of his troops by the cold.

Modern travellers likewise tell us, that in the middle of July ice is found every morning about the springs, yet while the sun is up, the weather is very warm.

They have a singular method of ploughing the land. Ten or a dozen oxen are put to one plough. The furrows are made exceeding deep, to preserve the seed from the intense cold, and to intermingle the soil of the surface, which is sandy and dry, with the more humid earth that lies beneath; yet the land is so impregnated with salt and nitre, that the roots of every thing would be burnt up, if a profusion of water was not every where used to meliorate the heat.

The rivers which water this country are the Cyrus, Lycus, Phasis, Araxis, Tigres, and Euphrates. The mountains are Ararat, the Paryadræ, Marufius, Antitaurius, Abus, Niphates, Molchick, and Gordyzean mountains.

In sect. 5, of chap. 7, we have given an ample account of the religion, customs, and ceremonies of the Armenians; we shall therefore only observe, that they speak two languages, which are distinguished by the appellations of vulgar and learned. The former is understood by the Armenians in general; but to be well versed in the latter, is deemed a great accomplishment, as it is only found in their ancient manuscripts, and used in the performance of divine service. They pretend that it bears no affinity to any other oriental language, but is superior to them all, being more energetic, expressive, and elegant, and comprizing not only all the common, but all the technical terms of theology, and the various

arts

arts and sciences. If what they assert is true, it only evinces, that the Armenians were formerly much more learned and polished than they are at present.

The Armenian merchants are in general men of probity and politeness. They manage all the trade of the Levant, and are in fact the greatest merchants in the universe. They spread themselves over the principal parts of the world, as many are to be found in Italy, France, Germany, Holland, England, &c. and in the dominions of the Great Mogul; all over the Turkish and Persian territories, in Siam, Java, the Philippine Islands, and all parts of the east, China excepted. The Armenians strike their bargains in the following singular manner: Several pieces of money are put upon a table at any convenient place; the buyer and seller then dispute with great seeming earnestness about the price of the commodity; the buyer offering the money to the seller, who pushes it away apparently with much indignation, and the squabble has such an appearance of ill humour, that a stranger would be led to imagine, it certainly must terminate in blows. The whole, however, is a customary affectation, and when the broker, who is always present at this farce, thinks that an equitable price is offered, he squeezes the seller's hand till he roars out, which is a token that he accepts the buyer's terms.

The capital city of Turcomania is called Arzerum, or Erzerum. It is situated on the northern extremity of the province, about ten days journey from the frontiers of Persia, and five from the Black Sea. It is the residence of a Turkish basha or bashaw, is defended by a good castle, and has a strong garrison of Janissaries commanded by an aga; it contains about eighteen thousand Turks, who in general purchase of the basha the name and privileges of Janissaries, or a dispensation of committing all kinds of disorders with impunity. The pay of a Janissary from the government, is from about two-pence halfpenny to ten-pence per day. In this city about eight thousand Armenians, and five hundred Greeks reside. The Armenians have two churches, several monasteries, and a bishop.

Arzerum is a place of great trade, which principally consists of copper and brass wares, the ore of which is found in the neighbouring mountains; printed calicoes, red and yellow leather, silk, madder, caviare, gall nuts, and beautiful furs, particularly fables. It is likewise a repository for vast quantities of merchandize, which come from the East-Indies, and a great thoroughfare. All who go from hence to Persia, except Turks, pay a capitation tax of five crowns, and five per cent. for all specie which they carry with them. Every stranger who enters the town is obliged to pay five crowns, and all merchandize is taxed at nine per cent. fix of which goes to the Grand Seignior, and three to the beglarbeg.

Fuel is very scarce, which is a great inconvenience in a place where the winters are so severe; in lieu of wood they are under the necessity of substituting cow-dung to burn. The summers are short and hot, and the country near Arzerum is tolerably fertile, but produces no good wine. The wheat is ripe in about two months after it is sown, and the barley in about four weeks. In the neighbourhood of this city a vast quantity of poppies grow, out of which the Turks extract their opium. The caviare is made of the spawn of sturgeons brought from the Caspian Sea, where these fish are remarkably fine; yet it is inferior to that made near the Baltic.

The piles of cow-dung, which is made into turfs, and the perpetual burning of that excrement, occasion a smell throughout the city which is exceedingly offensive to strangers. Every thing you eat or drink, even the very cream, is tainted with this vapour; yet travellers assert that there are coals in the neighbouring hills, but the inhabitants neither understand their nature, nor how to dig for them. The water is excellent, rivulets of which run through most of the streets, but the wine and brandy are difficult to be got at, though they are abominably bad when procured, for the sale of them is no where more strictly prohibited. The Greeks are obliged to inhabit the suburbs, because being tinkers, they make such a perpetual clattering in hammering and making a variety of brazen utensils, that it would disturb the tranquillity of the Turks; for those gentlemen are so exceed-

ingly delicate and indolent, that they cannot bear the thoughts of a noisy trade. This city lies in 40 deg. of north latitude, and 41 deg. 15 min. east longitude.

About six miles from the above city, there is a little village called Elija, which contains only a few small houses built with mud, but is famous for an excellent bath, which is a neat octagonal building. The basin is likewise of an octagonal form, and throws out two gulches of water as thick as a man's body. The Turks are continually flocking hither from Arzerum to bathe.

On the lake Van, or Wan, which is one of the largest in Asia, there is a city of the same name, situated in 38 deg. 12 min. north latitude, and 44 deg. 55 min. east longitude; it is large, and stands at the foot of a high craggy mountain, on which there is a fortress deemed impregnable, that commands the town and country, and has a strong Turkish garrison. The lake produces a variety of fine fish, particularly one of the pilchard kind, great quantities of which are exported to many distant places, as well as consumed at home, being used in sauces, and eaten in the same manner as anchovies. The lake is one hundred and fifty miles in circumference, receives many rivers into its bosom, and contains several islands; two of these islands, viz. Limdasi and Adaretan, are considerable, each having little villages and a monastery of Armenian monks on it.

Cars, or Kars, or as the Turks call it, Azam, is in 40 deg. north latitude, and 43 deg. 20 min. east longitude, about one hundred and five miles north of Arzerum. Being the last Turkish town towards the Persian frontiers, it is defended by a strong castle built upon a steep rock. Behind there is a valley watered by a river, which discharges itself into the Arpagi, and these two rivers unite in dividing the two empires. The city is almost square, and about half as big as Arzerum, but is neither populous nor handsome. All strangers have two things to dread, viz. the extortions of the Turkish officers, and the depredations of robbers. The houses are mean and in a ruinous condition. The basha of Car is subject to the governor of Arzerum. The country about it, though naturally fertile, is but very little cultivated. The Turks here have all private wells or cisterns, from a superstitious notion, that the Christians, who are much more numerous than the Mahometans, pollute the public waters, and render them unfit for a true Mussulman to use.

Iravan, Erivan, or Chirvan, is situated in 40 deg. 10 min. north lat. and 45 deg. 30 min. east long. It is about one hundred and eighty miles east of Arzerum, and has been alternately possessed by the Turks and Persians a great many times: in 1635 it was ceded to the Persians; but whether the Turks have regained it during the recent revolutions of Persia we are uncertain. It is a spacious place, but ill built and very dirty. The town is watered by two rivers, and the neighbouring country is extremely fertile in corn, wine, rice, cotton, &c. The castle is of no importance, and the fortifications are made of mud, so that heavy rains frequently damage it as much as artillery would. Over one of the rivers called Zengeric, there is a fine bridge of four arches. The governor is obliged to transmit to Constantinople an account of all caravans, ambassadors, strangers, &c. who pass through the city. Here provisions are exceedingly cheap, particularly game, and the fruits and wine are admirable. The public square, or piazza, is handsome, and the bazar, or market, capacious. The baths and caravanferas, as well as the governor's palace, are elegant and capacious buildings. The river Zengeric issues from the lake of Erivan, which is about twenty-five miles in circumference, and contains an island, with an Armenian monastery, the monks of which lead a life uncommonly austere, never speaking to each other but four times a year. Though the lake which surrounds them is plentifully supplied with the most excellent fish, and their little island abounds with a variety of delicious fruits, they must touch neither, except on the four times when they are permitted to speak to each other. All the rest of the year they are obliged to live upon herbs and roots, and even those must not be obtained by cultivation, but such as are the spontaneous produce of nature are to be selected. Near

Erivan is another famous monastery called the Three Churches, which is the residence of the great patriarch of the Armenians, under whom are forty-seven archbishops, who have each four or five suffragans. The archbishops, as well as the suffragans, usually reside in some monastery, over which they have a jurisdiction. Every Armenian above the age of fifteen is obliged to pay five-pence annually to the great patriarch, whose revenue amounts to about six hundred thousand crowns: he is, however, out of this sum obliged to pay a considerable tribute to the Porte, and to give alms to many poor Armenians.

Nackfivan stands about seven leagues from the Araxes. It was formerly called Artaxata, and was the residence of the ancient Armenian kings. It is built upon a plain which Hannibal gave to king Artaxas, who then made it the capital of all Armenia. The celebrated battle between Lucullus and Mithridates was fought near it. This city contains many bazars, caravan-serais, public baths, coffee-houses, handsome streets, &c. It is in 39 deg. north latitude, 75 deg. 55 min. east longitude, and stands about sixty-three miles south of Erivan.

Zulpha, or old Zulpha, to distinguish it from new Zulpha, near Isfahan, in Persia, stands on the Araxes, which begins to be navigable about six miles below the town. It was from this province that the famous Shah Abbas carried 77,000 families to help to re-people some of the depopulated parts of his own kingdom. He settled part of them in the province of Ghilan, and the rest at Isfahan, but many of the former died by means of the severity of the climate. Shah Abbas enjoined these captivated Armenians to apply themselves to traffick, and gave them great privileges and encouragement; so that their posterity are not only some of the richest people in Persia, but are the most distinguished merchants in those parts, trading to the Levant, and many other parts of Asia, and corresponding with the merchants of a vast commercial nations. About Zulpha are several Armenian monasteries, the monks of which are Roman catholics of the dominican order; many young Armenians are sent to Rome to be educated, who on their return fill the vacancies that may have happened in the monasteries. The district of Zulpha contains about 6000 souls, who are all Roman catholics, and do not in the least differ in their worship from those of Europe, except that mass is celebrated in the Armenian instead of the Latin tongue. Their archbishop is chosen by themselves, but he is obliged to go to Rome to be confirmed by the Pope before he can officiate. The monks of one of the monasteries pretend that St. Matthew and St. Bartholomew suffered martyrdom there, which induces great numbers of both Christians and Mahometans to resort thither. At the foot of a high mountain near Zulpha are some medicinal springs, which are celebrated for many virtues, but more particularly for curing those that are bit by any venomous creatures.

Armenia Minor is at present of no great importance, though it was formerly very considerable, being bounded on the east by the Euphrates, which parted it from Armenia Major, on the south by mount Taurus, and on the west and north by a long chain of mountains, called Antitaurus, Amanus, &c. It is in general a mountainous country; but in some places there are fruitful vales, abounding with olives, vines, &c. This country was a part of Cappadocia till the reign of Antiochus the Great, when Zadrades and Artaxias, seizing on Armenia, and adding it to some of the neighbouring provinces, introduced the distinction of Armenia the Greater and Lesser. In the Roman times it was divided into four provinces, viz. Lavana, Mariana, Aravena, and Melitene, which contained the following cities, Melitene, Nicopolis, Garnace, Arabyllus, Daicusa, Zimara, and Ladana. The manners, customs, &c. of the people always were and still are the same as those of Armenia Major.

It is imagined that Armenia was first peopled by the immediate descendants of Noah; it then became a kingdom, and remained so till it was subdued by the Persians; it was afterwards possessed by the immediate successors of Alexander the Great, then conquered by the

Romans. About the year 687, the Saracens made themselves masters of it, and held it till they were deprived of it by the Tartars and Turks, from whom it had the name of Turcomania.

It was on mount Ararat in Armenia that the ark of Noah rested; but on what particular part geographers and historians are not agreed; the Armenian monks tell many fabulous stories which are not worth repeating concerning it. Mr. Tournefort tells us that the ascent is not only difficult and tedious, but even dangerous, through the ruggedness of some parts, and deep sands of others; not to mention the danger from the beasts of prey; the horrid precipices are beheld with terror, even by the guides themselves. The situation of Ararat was, however, very convenient for the sons of Noah to proceed to the land of Shinar, as the distance is but trifling.

S E C T. IV.

Of Diarbec in general.

DIARBEK in its largest extent comprehends the provinces, anciently called Mesopotamia, Chaldaea, Babylonia, and Assyria, and now termed Diarbec, properly so called, Yerach, Irac Arabic, or Eyrace Arabic, and Curdesan.

It extends about 600 miles along the banks of the Euphrates and Tigris, from mount Taurus on the north, to the Persian gulph on the south. The breadth in some places is 300, and in others 150 miles.

The air is exceedingly temperate, and serene, unscorched by excessive heats, and not incommoded by severe frosts. The country produces silk, and is fertile, with very little cultivation, being rich in grain, fruits, and pasturage. Numerous flocks, and abundance of cattle feed on the latter; indeed, in some parts there are considerable uninhabited deserts.

The celebrated rivers Euphrates and Tigris flow through this country, and not only supply it with excellent fish, but contribute exceedingly to its beauty and fertility. The Tigris rises in the Armenian mountains, and acquired its name from its rapidity, for that word in the Median language implies a dart or arrow. It passes through the lake Arethusa, and afterwards sinking into the earth rises again on the other side of mount Taurus; that it is the same river, hath been evinced by a variety of experiments, for things thrown in on one side, are brought up on the other. It proceeds from thence to the lake Thespires, but often sinks under ground by the way, particularly in one place, where it hides itself for the space of twenty five miles, and then breaking up to the surface of the earth, it proceeds with great rapidity. Between Atlyria and Mesopotamia it receives several rivers into its bosom; and below Bagdat it branches into two channels, which both disembrace themselves into the Euphrates, and by that means form an island.

The Euphrates, which is the most considerable river in Asia, hath its source in mount Taurus; proceeding westerly it crosses Turcomania, then turning southward, it divides Syria from Diarbec. Afterwards running along the Western limits of Arabia Deserta, it waters a great number of towns, and then flows smoothly to the city of Aria; where the reflux or tides of the Persian gulph disturb its stream, and discolour its waters, though ninety miles distance from it. At about 60 miles from the Persian gulph it unites with the Tigris. In general it flows gently, and waters a great number of fertile, and delightful plains; its banks are embellished with perpetual verdure, and adorned by many trees, particularly palms; it is neither deep nor wide, except when the melting of the snows on the Armenian mountains occasions it to swell; but the waters are deemed exceedingly salubrious. Diarbec, as a frontier province towards Persia, is always well guarded; yet such is the tyranny of the Turkish government, and the indolence of the people, that the country is very little cultivated, and not populous. The divisions of this province, as well as of all others belonging to the Turkish empire, are into beglerbegates and bashliaps. These are subdivided into sangachships, inferior to which, are the ziamets and timarots.

S E C T.

S E C T V.

Diarbec Proper, or Mesopotamia.

DIARBEC Proper, or as the Arabs call it, the Island, from its being situated between two rivers, is governed by a beglerbeg, under whose jurisdiction twelve fangiacs act.

The capital of this province is the city of Diarbec, situated in 37 deg. 35 min. north lat. and 40 deg. 50 min. east longitude. It is encompassed by two walls, the outermost of which is defended by 72 towers; there are but three gates, over that towards the west some Latin and Greek inscriptions are seen, though many of the letters are almost obliterated. The name, however, of Constantine is still visible, and frequently repeated, which gives occasion to surmise that it was either originally built, or greatly repaired and improved by that emperor. The Tigris forms a half moon about it, and from its walls to the water side, there is a steep precipice. It contains about 20,000 inhabitants, and upon the whole is one of the most commercial, strong, opulent, and populous cities of all Asiatic Turkey. It is supplied with water from the Tigris by means of an artificial canal, and embellished with many noble piazzas or market places, and other elegant buildings, particularly a spacious grand mosque, which was once a Christian church. On the sides of the river are several caravanseras or inns; and near the town is a chapel, in which the Turks affirm that Job lies buried: about a league from the city, the Tigris is fordable, nevertheless there is a stone bridge over this very part, on account of the floods, which are occasioned by the excessive rains and melted snows, and which often render the ford impassable. The neighbouring country is pleasant and fertile. The pigeons are larger and more delicate than any in Europe. The meat, bread and wine are admirable, and the fruits excellent.

The men are more affable here, and the women are treated with much more politeness, and have greater indulgence granted them, than in any other part of the Turkish empire. The chief manufactures carried on here are dyeing, dressing and tanning, particularly goats skin, which is commonly known by the name of Turkey leather, of which immense quantities are vended in all parts of Asia and Europe: they likewise dye linen and cotton to great perfection. The waters of the Tigris are said to be admirably adapted to dyeing, and give the leather a finer grain, and leather, linen, and cotton, a livelier colour than any other waters.

The bafsa, who is governor of this city, is exceedingly powerful, and usually has a body of 20,000 cavalry under his command, that he may be the better enabled to repel the incursions of the Curdes and Tartars, who in great companies of horse attack and rob the caravans.

The city of Mosul or Moussul stands on the banks of the Tigris, and is situated in 36 deg. 59 min. north latitude, and 43 deg. east longitude, opposite to the ruins of the ancient city of Nineveh. It is surrounded by handsome stone walls, and is very spacious, being about a league in circumference, but the number of inhabitants are not proportionable to the extent. The people have great commercial connections with the inhabitants of Bagdat, and the merchants of Curdistan. Caravans likewise pass through it to and from Persia. The bafsa, whose residence is in the castle, has always 3000 men under his command. It is singular, that the soil on the city side of the river is exceedingly barren, but on the opposite it is very fertile. The heat is so excessive in summer, that none go out of doors from two hours after sun rise till an hour after fun set. There is likewise a malignant and dangerous wind called famel, which reigns from hence to Surat, and is supposed to be the same east wind mentioned by Job. It is impregnated with little streaks of fire as small as hairs, which immediately kill those who breathe or inhale them, and turn them as black as a coal. When the people perceive them coming, they fall flat on their faces, and sometimes escape. This wind is felt chiefly on the banks of the river, but not on the water, and is deemed to proceed from sulphurous vapours, which are kindled by agitation. Independent of this wind

the hot air is often dangerous and injures the lungs, inflames the blood, and parches the skin, or raises it into blisters, and occasions it to peel off. On this account travellers wear a kind of mask made of a soft black crape to preserve their eyes. But if after all their precaution they become inflamed, the afflicted person anoints them with a mixture of sugar and long pepper sifted very fine, and made into a salve.

Rika or Racha stands on the Euphrates, in 35 deg. 58 min. north latitude, and 39 deg. 50 min. east longitude, about 105 miles south west of Diarbec; the bafsa, who resides in the castle, has a garrison of 12,000 spahis; it is, however, but a mean town, and contains nothing to merit description.

Orpha or Orfa, lies in 37 deg. 16 min. north latitude, and 39 deg. 15 min. east longitude; and is situated at the head of the river Scirtas on the east side of the Euphrates, and about 60 miles from it. The inhabitants affirm that it was the place where the city of Edessa stood, and where Abraham dwelt. The city is surrounded by a good stone wall, and is about two leagues in compass, but the houses in general are deserted, and in a ruinous condition, and those that are inhabited are but low and ill built; upon the whole the place resembles more a wilderness than a metropolis, though Tavernier is inclined to deem it the capital of Mesopotamia; the inhabitants carry on a great trade in some excellent tapestries, and yellow leather. The neighbouring country is exceedingly rich in corn, wine, fruits, &c. the city is governed by a beglerbeg, who has 150 janissaries and 600 spahis under his command, to awe the Arabian free-booters. Several pleasant gardens surround the walls of the city, and are watered by small artificial canals, which flow through cuts from one that is pretty large; in the time of our Saviour, this city and territory had a prince of its own named Agbarus.

Bir or Beer is in 37 deg. 15 min. north latitude, and 38 deg. 15 min. east longitude. It is situated on the side of a hill to the east of the Euphrates, and defended by two large old castles, the one on the land side, and the other on the banks of the river. The garrison consists of about 200 janissaries and 400 spahis commanded by a fangiac. The houses extend from the river side to the top of the hill, where the castle is placed, the walls of which are in a ruinous condition. On the opposite side is a noble, capacious, strong, and well guarded caravanera; the Euphrates is here about a mile broad, and its current smooth, so that it is a kind of ferry from Syria; caravans are not allowed to enter the city, but are obliged to pass through a difficult road by the side of it; in order to gain a caravanera on the top of a hill, at night the officers come to receive the customs from all, except those who have saddle horses. Here are all kinds of provisions in plenty, particularly bread, wine, and fish. The neighbouring territory is pleasant, fertile, and well cultivated, except to the eastward, where it is rough, hilly, and rather sterile.

In Diarbec are a few other less considerable cities and towns, namely, Gezira, in 37 deg. 30 min. north latitude, and 39 deg. 10 min. east longitude. It is situated in an island of the Tigris, the word Gezira signifying an island in the Arabic language. It is a small but rich commercial city, where a great number of merchants meet to carry on a trade in tobacco and gallnut, which are plentifully produced in the mountains of Taurus. They make no wine, but dry all their grapes for raisins. The city is governed by a bey.

Amadia, or Amad, is about 72 miles east from Gezira, and the same west from Mosul. Zibin, in the midway between Orfa and Mosul, is a tolerable town situated on an ascent. It is surrounded with good walls and ditches, well supplied with springs and fountains, and furnished with good store of provisions.

Nalbin, or Nalbin, about 35 miles from the Tigris, is the residence of a Turkish fangiac. The city is divided into two wards, each on an eminence, with a large tract of ploughed land between. This gives it a pretty appearance at a distance, though both wards in reality are scarce worthy of the name of a small village; however, arches, gates, and the remains of a noble church are still visible, which evince that its ancient situation

was far superior to its present. The soil is fertile, and, as the chief business of the inhabitants is agriculture, the land is well cultivated, and the inhabitants plentifully supplied with corn, wine, fruits, &c. Merdin, or Mar-din, is situated on the west side of the Tigris, between Mosul and Bagdat, and about 25 miles from Diarbec, in 37 deg. 15 min. north latitude, and 40 deg. east longitude. It is about 5 miles in circumference, surrounded by a strong wall, and defended by an excellent castle of about a mile in compass, which is situated upon an almost inaccessible rock. The castle abounds in fine springs, and even contains corn fields. It is the residence of a fangiac, and a garrison of 400 janissaries and 200 spahis. Its strength is such, that Tamerlane the Great was obliged to abandon it, after having invested it for near three years. The Turks have the following proverb concerning its impregnability, "that to attempt to take Merdin, is like making signs to the blind." The city is well built, adorned with many noble houses and a fine fountain, the waters of which come from the citadel. The manufactures are, silk, cotton and gold and silver stuffs. The air is temperate and serene; the territory rich and fruitful. Many christians inhabit the city, who have an archbishop subject to the patriarch of Antioch.

SECT. VII.

Eyraca-Arabie; or, Irack-Arabi, the *Antient Chaldaea*.

EYRACA-Arabie, Yerack or Irack-Arabi, hath been anciently termed Shinaar, Babylonia and Chaldaea. It lies between 30 and 40 deg. north latitude, and is bounded on the north by Diarbec; on the west by the deserts of Sham; on the south partly by the same deserts, and those of Arabia; and on the east by Susiana and the Median and Assyrian mountains.

The name of Chaldaea is derived from the Chaldeans, and that of Babylonia originates from the tower of Babel. The air of this country is in general very serene and temperate, but at certain times it is so extremely dangerous, and the heats so excessive, that formerly many of the inhabitants used to sleep in cisterns of water; and this pernicious practice is at present not entirely discontinued. The inhabitants are sometimes visited by the pestilential wind already mentioned in our description of Mosul, and which has so much excited the attention of modern travellers and philosophers. As they have no rain for eight months in the year, the land is watered from the Euphrates and other rivers, by means of a great number of engines admirably constructed for that purpose. Sometimes it hath not rained for the space of two years and a half, and the inhabitants are thoroughly fatigued if it only rains thrice annually, as that is sufficient to answer all their purposes.

Herodotus informs us, that in the land of the Assyrians it very seldom rained, and that though the country bore great resemblance to Egypt, yet it was not watered by the inundation of a river, but by the industry and ingenuity of the inhabitants, which have rendered it one of the finest and most fertile countries upon the face of the earth. It certainly in general yields grain two hundred fold, and frequently three hundred; and its fertility is such, that it would astonish a traveller who had seen all the rest of the known world. The palms, particularly those of the date kind, afford the inhabitants meat, wine and honey. The millet and sesame shoot up to the size of trees, and the barley and wheat have leaves of four fingers in breadth. They have neither olives nor grapes, but the sesame is an excellent substitute to furnish oil, where olives are wanting, and the palm supplies them with wine in lieu of grapes.

Formerly the Tigris and Euphrates used to overflow in the months of June, July and August, and cover the whole country with water, and the inundations were usually increased by torrents of melted snow, which poured down from the Armenian mountains; but those floods proving very detrimental in various cases, the inhabitants guarded against them by cutting a great number of artificial canals, rivers, and rivulets, which they effected with infinite assiduity and labour. Thus the waters were properly distributed, an easy communica-

tion made between every part of the country, and the inhabitants universally benefited. The pasture, being exceedingly rich, great numbers of cattle are fed, which not only plentifully supply the inhabitants with meat, but with milk, butter, &c.

This country is famous for the great plain of Shinaar, where the whole race of mankind were collected together after the flood, and from thence dispersed themselves over the face of the earth; for being the seat of the terrestrial paradise, as some authors affirm, but that opinion is denied by others; and for being the place where the tower of Babel was built, and the renowned city of Babylon, of which the vestiges, or what are shewn for such, are at present very trifling.

The first foundation of Babylon is by some authors ascribed to Semiramis, and by others to Belus. Who was the founder is not material, but it is certain that Nebuchadnezzar was the person who raised it to that pinnacle of glory, as to become the principal wonder of the world. The most remarkable works therein were five, viz. the walls of the city, the temple of Belus, the palace and the hanging gardens in it, the banks of the river, and the artificial lakes and canals made to drain the river.

The walls were 60 miles in circumference, 350 feet high, and 87 thick. The city was in the form of a square 15 miles each way. The walls were built of large bricks cemented together with a kind of glutinous slime found in the country, which is superior to any lime, and grows much harder than the bricks themselves. They were encompassed by a vast ditch lined with bricks, cemented by the same kind of bitumen, and filled with water. The earth which was dug from the ditch, served to make the bricks for the walls; we may therefore, from the astonishing magnitude of the walls, conceive the greatness of the ditch. An hundred gates made of solid brass, served as entrances to the city; that is, 25 on each side. Between every two of these gates were three towers, and four more at the angles, and three between each of the angles and the next gate on either side. The towers were all ten feet higher than the walls. From the 25 gates on each side of this great square, 25 streets went in right lines to the opposite gates: so that the whole number of streets were 50, each being 15 miles long, cutting each other at right angles: thus was the city divided into 676 squares. The houses were noble edifices, and a branch of the Euphrates ran across the city from north to south. In the middle there was a bridge; at each end of the bridge was a palace; the old palace on the east, and the new palace on the west side of the river; the former took up four of the squares, and the other nine; and the temple of Belus, which stood near the old palace, took up another of these squares. The old palace was four miles in circumference, and the new palace eight; the latter had three walls one within another, and was strongly fortified. In the latter the hanging gardens were the greatest curiosity; they contained a square of 400 feet, and were carried to the height of the wall of the city by several large terraces; the ascent was from terrace to terrace by stairs of 10 feet wide. This vast pile was sustained by arches built upon arches, and strengthened by a wall of 22 feet in thickness, which surrounded it on every side. The gardens contained all kinds of flowers, plants, and even large trees. On the upper terrace was an aqueduct which served to water the whole. To prevent the overflowing of the Euphrates, which did great damage not only to the country but to Babylon itself, Nebuchadnezzar embanked the river with prodigious banks of bitumen and bricks, and cut two canals to drain off the overflows into the Tigris, before they should reach Babylon.

The ancient Chaldaean language differed from the Hebrew which was spoken in Mesopotamia; but both tongues were blended together by means of the Jews, and, mutually corrupting each other, their intermixture formed the present Syriac. The principal cities and towns of Eyraca-Arabie are, Bagdat or Baghdad the metropolis, delightfully situated in a fine plain on the eastern bank of the Tigris, and lies in 33 deg. 20 min. north latitude, and 43 deg. east longitude. It was founded in the 145th year of the Heigera by the caliph Al-mamur,

country, and the pasture, being as good, which is furnished with meat, and the plain of Shi-
were collected dispersed the seat of the empire, but that being the place of the renowned, or what are called.

By some authors Belus. Who is certain that aided it to that principal wonder is therein were temple of Belus, the banks of canals made to

ence, 350 feet the form of a were built of and of glutinous superior to any bricks themselves, and filled with the ditch, served may therefore, walls, conceive gates made of y that is, 25 these gates were 2, and three be- gate on either than the walls, eat square, 25 gates: so that each being 15 t angles: thus the houses were gates ran across the there was a palace; the old in the west side the squares, and, which flood these squares, inference, and three walls one. In the latter curiosity; they carried to the large terraces; air of 10 feet hes built upon feet in thick- The gardens and even large ueduct which he overflowing ge not only to hadnezzar em- bitumen and overflowsings Babylon. red from the nia; but both of the Jews, intermixture pal cities and Baghdad the plain on the deg. 20 min. It was founde caliph Al- manfur,

manfur, and is built upon the same spot where the ancient Silencia stood, and not, as some writers have falsely supposed, where the ancient Babylon stood. Bagdat was the seat of most of the caliphs of the race of Al-abbas. In the year of the Heigera 636, it was taken by the Tartars, in whose hands it remained till 1392, when Tamerlane the Great subdued it. Ufun Cassan, a Turkoman prince, conquered it A. D. 1470. Shah Ismael, emperor of Persia, possessed himself of it A. D. 1508. The sovereignty of it was then contended for above 100 years between the Persians and Turks; at length, A. D. 1638, it was totally subdued by the Turks, under the conduct of Amurath the second, and hath remained in their hands ever since. This city was formerly embellished by many superb palaces, and other magnificent edifices, besides a variety of colleges and other seminaries of learning. It was populous, opulent and well fortified; the language was the most pure and elegant Arabic, and the manners of the people the most polite imaginable, as this city contained more learned men, and noble families than any other in the east.

Though this city at present groans under the tyranny of the Turkish yoke, it is still the grand emporium of the Ottoman empire towards the Persian side. It is frequented by innumerable merchants and passengers travelling to and from Persia into Syria, Palestine, Egypt, Natolia, &c. A Bassa hath his residence here, to whom every passenger pays tribute, which annually produces a very capital sum. Besides mahometans, here are many christians who are publicly tolerated, and jews, some of whom reside constantly in the place, but many others only come annually in order to visit the sepulchre of the prophet Ezekiel, which stands about a day and a half's journey from the city.

The Pacha of Bagdat is usually a vizir. The garrison amounts to about 3000 men, the city is near a mile and a half in length, and about half the same in breadth. The walls are of brick strengthened with towers, upon which are mounted 60 pieces of cannon, the largest of which is not above a six pounder. Towards the land side are four gates, and one upon the river. Over the river is a bridge of 33 boats brought from Mosul. The castle, which is in the city on the north, is encompassed by a wall mounted with 150 pieces of cannon without carriages. There is a tefender to collect the revenues of the Grand Seignior, and a cady to assist the pacha in the civil government. The mosques, of which there are five in number, are tolerably well built; two of them in particular, which are adorned with domes, covered with varnished tiles of different colours. The caravanserai are ten in number; the bazars or market places are all arched, and watered several times a day to mitigate the heats which might otherwise incommode the merchants. The pilgrims who visit Mecca by land pass through Bagdat, and pay four piastres by way of tribute, which brings a very considerable revenue to the Grand Seignior.

The inhabitants of Bagdat are computed to amount to about fifteen thousand: during the summer the markets are kept in the night, and the inhabitants are obliged to lie on their backs to avoid the excessive heats: instead of candles, oil of Naphtha is burnt; the women are allowed to go to the baths every Wednesday morning to wash and perfume themselves: on Thursdays the married and unmarried are permitted to go to the sepulchres to pray for the dead.

Curfa is situated in 31 deg. 38 min. north latitude, and 44 deg. 57 min. east longitude, about 60 miles to the southward of Bagdat, and on the west side of the Euphrates; it was formerly a city of importance, being the residence of the caliphs after they had quitted Damascus, and before they had built Bagdat, but is now quite desolated.

Traax on the Tigris is a strong and well-fortified town, having two castles; it is about 42 leagues beyond Bagdat. The Chaldean Apamea is supposed formerly to have stood here.

Bassora, or Basrah, on the frontiers of Persia, lies in 30 deg. 17 min. north latitude, and 49 deg. 10 min. east longitude, being about 250 miles south east from Bagdat, and 240 south west from Isfahan: it was built

A. D. 636, by Omar the second caliph, in order to cut off the communication between Persia and India. This city is 12 miles in circumference, opulent, and populous, but the buildings have nothing extraordinary in them, the houses being only two stories high, built with bricks dried in the sun, and flat on the tops. The city is founded upon a stony soil, and the environs are barren; but the circumjacent country is so exceedingly fertile and delightful, that it is deemed by the Arabians one of the four paradises of the east. The inhabitants are supplied with water from the Euphrates, by a canal which is capable of carrying vessels of 50 tons burthen: there is a fortress at the mouth of it, which is about 45 miles distant from the sea. The whole country lies so low that it would be subject to continual inundations, if a stout dyke or embankment did not prevent those calamities. The hot winds are very troublesome, and bring with them clouds of sand from the neighbouring deserts: it is a place of great trade, and swarms with vessels from most of the kingdoms of Asia and Europe. The English and Dutch have very considerable factories maintained by their respective East India companies, for the better carrying on their commerce with China and other eastern parts, their dispatches being forwarded to England and Holland by the way of Damascus and Aleppo, by means of Arabian couriers, who are exceedingly expeditious. The Dutch trade here with spices, and the English with pepper, cloves, &c. The principal commercial affairs are managed by Armenian, Indian and Persian merchants; and all the richest commodities of India and Europe are here sold. The caravans to Mecca pass through this city, which is another source of wealth. The duties on goods are about 5 per cent. The inhabitants consist of Mahometans, Jews, Jacobites, Nestorians, Catholics, and Chaldean Christians or Christians of St. John, who are pretty numerous. There is a famous college here, called the Academy of Nezami, from its founder Nezami, Al-Molk, the Grand Vizir of Shah Malac, the third sultan of Iran. At present this city is a flourishing seat of literature, though it hath fewer colleges than Damascus, or Cairo. The horses which are bought here are very valuable, on account of their being able to travel with great expedition, and to undergo incredible fatigue: they sell from a thousand to two thousand crowns.

This city is subject to an Arabian prince, who is tributary to the Grand Seignior. His revenue arises from the exchange of money for horses and camels sold here, but chiefly from his palm-trees, of which he hath a plantation of 90 miles in length. The manner of planting the palms being very singular, we shall describe it. About 300 kernels are buried in the ground in the form of a pyramid, with the points of the kernels upwards, till the whole ends with a single kernel. The earth is then pressed close round it, and upon it. It is asserted by some, that if the male and female palm are not planted close to each other, they will bear no fruit; while others affirm that it may be made to bear by taking the blossoms from the male, and inoculating the female therewith at the top of the stem. The income of the prince is so great from money, horses, camels, and dates, as to enable him to lay by annually 3,000,000 of livres, after all the expences of government and his tributary loan are defrayed. The prince gives liberty to persons of all nations to trade here, and the police is so well managed, that people are safe in the streets at all hours of the night: the garrison consists of about 3000 janissaries. In 1691 it is affirmed that the plague visited this city, and swept away 80,000 of the inhabitants.

S E C T. VIII.

Curdestan, or Assyria.

CURDESTAN, or the country of the Curdes, lies on the east side of the Tigris towards Persia, by which empire it is bounded eastward by the Tigris; on the west it hath Eyraca-Arabia on the south, and Turcomania on the north.

Towards the south it is not above 90 miles broad, but to the northward it extends near 200 miles from east to west. From north to south it reaches from 35 deg.

C c

30. min

30 min. to 27 deg. 20 min. north lat. it was formerly a fine fertile country, but having been frequently the seat of war between the Turkish and Persian empires, it hath been depopulated, and rendered almost a wilderness.

This country was anciently known by the name of Assyria, deriving its name from Aslur, or Aslur the son of Shem, and grandson of Noah. The first great monarchy in the universe was founded here; and here the magnificent city of Nineveh once stood. This city was built upon the Tigris, opposite to where Mosul at present stands. The walls were sixty miles in circumference, the same extent as the walls of Babylon; there was, however, a difference in the form of the two cities, Babylon being exactly square, and Nineveh oblong: the walls were sufficiently thick to admit of three chariots to go a-breast upon them; they were flanked with 1150 turrets, each of which rose 200 feet above the walls. At a small distance from the ruins, there is a Turkish mosque upon a hill, on the place where it is pretended the prophet Jonas was buried. His tomb is always covered with a rich carpet, and some tapers, and lamps are kept perpetually burning over it. Here two Turkish priests are continually employed to read the Alcoran, which draws a great number of Turks, Persians, &c. to the place.

In the territory between Nineveh and Bagdat are several hills of sulphur, to which some travellers impute the pernicious qualities of the hot winds, or famiel, with which the country about Old Bagdat is particularly infected. There likewise are some sulphurous hot baths at a village called Alchamam, which is about a day's journey from Mosul; and at Attendachi there is a hill, from which the Arabs dig gold.

In the same territory tamarisks, liquorice, and sumach are produced in great plenty; the latter, together with salt, being infused in water, gives it a red tinge, and renders it cool, sweet, and salubrious: taken in broth it is a remedy for the bloody flux. This part of the country is greatly infested by wild beasts, particularly lions, jackalls, and ceracoulacks, or wild cats, who are remarkable for having large black ears of half a foot in length. Those who navigate the river in boats always go well armed on account of the lions, who will plunge into the water, and attack the passengers with great fury.

The western skirts of this province are washed by the Tigris. Three other rivers, viz. the Lycus, Caprus, and Gorgus, flow through it at almost equal distances: the first derives its name from a wolf; the second from a goat; and the third is the Zeben of Pliny.

The Curdes are supposed to be the lineal descendants of the ancient Chaldeans; they inhabit this country, and some parts of Persia, and subsist principally upon rapine and plunder. They are continually upon the watch for caravans, and when they meet with one, if they are strong enough they usually rob and murder the whole company. While the weather permits, they dwell in tents upon the plains, and do not retire to the villages till the snows compel them. They range from Mosul to the Euphrates, and acknowledge no subjection either to Turks or Persians. They pretend to call themselves Christians, though they have the most gross, ridiculous, superstitious, and absurd notions of christianity imaginable; and their chief object of worship is the devil, of whom they are greatly afraid. In fine weather they drive their herds and flocks about in search of pasture, and while the husbands look out for plunder, the women manage the cattle, and make butter and cheese. Their drink is either milk or water. The men ride upon very fine swift horses, their only weapon being a lance; their tents are large, and made of coarse brown cloth, that serves likewise for a covering to their portable houses, which are square, and made of cane hurdles. The floor is covered with mats, and serves both for the purposes of bed and table. When they remove, they load their oxen with wives, children and houses, which are taken to pieces for the purpose. They are very disagreeable to look at, having small eyes, dark complexions, wide mouths, black hair, and ferocious aspects; nevertheless they are very stout and nimble, and, while children, usually go naked, which renders them extremely hardy.

Cherefoul, the capital of Curdesten is in 36 deg. north lat. and 45 deg. east long. and is situated about 150 miles north of Bagdat. The houses are all hewn out of a rock on the side of a hill, which extends a mile in length; and there is an ascent to them of about 20 steps: the basha or governor of the province resides here, and hath several sangiacs under him.

Arbella is celebrated in history for the famous battle fought in a plain near it, between Alexander the Great and Darius; it is in 35 deg. north lat. and 77 deg. 20 min. east long. and situated between the Caprus and Lycus, or the two Zabs, as some writers term those rivers. The natives shew a mountain in the neighbourhood, where the ruins of a castle are yet to be seen, in which tradition says, Darius stood to see the success of the battle; the mountain itself was named Nicatorius by Alexander, in commemoration of the above victory.

Betlis is situated in 37 deg. 55 min. north lat. and 43 deg. 30 min. east long. and is the residence of a prince of the Curdes, who is independent both of Turks and Persians, and so powerful, that he can raise a body of twenty five thousand horse, besides a considerable number of foot, among the shepherds of the mountains, who are trained to arms; so that though his dominions are surrounded by Turks and Persians, they are both obliged to keep fair with him from motives of policy, because it is at all times in his power to stop and plunder the caravans that go between Aleppo and Tauris, the road from the former being within a day's journey from the town, cut in several places out of the rocks between two mountains, and only broad enough for one camel to pass. Both the town and castle are so strongly situated, that the only pass may be defended by ten men against a thousand; so that this prince is really formidable, and cannot be robbed of his independency. The city is built between two high mountains distant from each other about a cannon shot; the castle is situated upon a hill that resembles a sugar loaf; and there is no coming at it but by a winding path cut in a rock, which is exceedingly steep, rugged, and difficult to ascend. Before the castle can be entered, three drawbridges must be passed, and afterwards three courts previous to the approach to the palace. The city extends, on each side of the other two mountains, from the top to the bottom, containing many houses and two caravanseras.

Harpel is situated on the river Caprus, and is surrounded by a mud wall; the houses are miserably built: it is, however, a large town, and the residence of a sangiac.

Holwan, in 35 deg. north lat. and 47 deg. 10 min. east long. is situated between the mountains that divide the Persian, Irak, Curdistan, and Chaldaea. The Mahometans, who believe that Elijah is still alive, affirm that he lives in one of the mountains near this town.

Some writers will have Amadia to belong to this province, but the most authentic geographers place it in Diarbee; we have therefore followed their example, as may be seen by referring to that province.

SECT. IX.

Afia Minor, Anatolia, or the Levant.

ASIA Minor, Anatolia, or, as it is corruptly called, Natolia, is a large peninsula, and hath been denominated Asia Minor to distinguish it from the main Asiatic continent. It received its Etymons of Anatolia and the Levant, by which it is still known, on account of its eastern situation with respect to Europe. On the north it is bounded by the Euxine sea; on the north west by the Archipelago, the Hellespont, the Propontia, or sea of Marmora, and the Thracian Bosphorus, or strait of Constantinople; on the south by the Levant sea, Syria, and the Euphrates; and on the east by the Mediterranean. It lies between 37 deg. and 41 deg. 30 min. of north lat. and 27 and 40 deg. of east long. extending in length about 600 miles from east to west, and in breadth about 320 from north to south. It is divided by modern geographers into Anatolia, properly so called, Amasia, Aladulia, and Caramania. Those provinces anciently included Galatia, Paphlagonia, Pontus, Bythinia, Mylia, Phrygia, Lydia, Macedonia, Ionia

Ionia, Æolis, Caria, Doris, Pamphilia, Pisidia, Capadocia, Lycia, Lycæonia, and Cilicia. Anatolia is under the government of a viceroy or beglerbeg, to whom several bassas, and a great number of sangiacs are subordinate.

Asia Minor naturally is, and always hath been, deemed one of the finest countries in the universe; yet such is the miserable policy of the Turkish government, and the indolence of the people, that it hath been suffered to become a mere wilderness; and, though uncommonly rich, fertile, and well watered, they have permitted it to be over-run with weeds, briars and brambles. The air is exceedingly serene and temperate, and would doubtless become still more salubrious, if the lands were properly cultivated. The inhabitants are not incommoded by excessive heats, nor chilled by intense cold frosts; all is moderate, delightful, and salubrious. The few cultivated parts, though the land is prepared in a very imperfect manner, produce, with little labour, great plenty of various sorts of corn, exquisite grapes, of which admirable wines are made, oranges, lemons, citrons, olives, figs, dates, &c. &c. Besides abundance of coffee, rhubarb, opium, balsam, galls, and many other valuable drugs, gums, &c.

Anatolia is excellently well watered; the principal rivers are those known by the names of Xanthus, Cydnus, Mæander, Granicus, Scamander, Cayster, Hermus, Pactolus and Caicus; which discharge themselves into the Mediterranean and Euxine seas; the Archipelago and the Euphrates. It hath some lakes, the principal of which, Guel-Bug-Shaw, is 30 miles in length, and 23 in breadth.

S E C T. X.

Anatolia Proper.

THIS is the nearest to Europe, and the largest of the four provinces into which Asia Minor is divided. It extends almost from 26 to 35 deg. of east long. and from 37 to 41 deg. of north lat. being bounded by the Archipelago and Propontis to the west; by the Euxine sea to the north; by Caramania on the south; and by Amasia and Aladulia on the east.

This province is governed by a beglerbeg, who has subordinate to him five sangiacs, 245 zaims, and 7740 timars; the number of troops are 60,000: The annual revenue of the beglerbeg is 1,000,000 of aspers.

Anatolia Proper contains the provinces of Bithynia, Mysia, the Lesser Phrygia, Æolis, Ionia, Caria, Doris, Lydia, Phrygia, Galatia, and Paphlagonia.

Bithynia is separated from Europe only by the Thracian Bosphorus; the soil is naturally rich, but, like many other fine parts of the Turkish empire, is very much neglected.

Prusa, or Bursa, as the Turks term it, is the capital of Bithynia, and was the metropolis of the whole Ottoman empire before the Turks possessed themselves of Constantinople. It lies in 40 deg. 16 min. north lat. and 29 deg. 35 min. east long. It is situated at the foot of mount Olympus, 20 miles from the fra of Marmora, and 38 south of Constantinople: it is exceeding well built, and deemed one of the best paved cities in all the Turkish empire; the streets are spacious, the caravanseras noble and convenient, and the mosques magnificent; the latter are adorned with cupolas and minarets, covered with lead, and computed at about 300 in number: in one of the mosques, the tombs of many of the ancient Turkish sovereigns are to be seen. Though the seat of empire has been translated to Constantinople, this city still preserves a share of its ancient grandeur, beauty, and opulence; it is likewise a place of considerable traffic, as a caravan goes every two months from hence into Persia, and several others pass through it from Aleppo, Constantinople, &c. to Ispahan. In the Bezestine all kinds of commodities of home manufactory, and others from the Levant, are exposed to sale; it is a large edifice, well built, and contains many excellent shops and warehouses. The workmen of this city manufacture the best silks, hangings, carpets, tapestries, &c. in Turkey. The city is about three miles in circumference, but the walls are falling to decay. It is computed to

contain 40,000 Turks. The suburbs, which are more spacious and handsome than the city itself, are inhabited by 4000 Jews, 500 Armenian and 300 Greek families, independent of many foreigners, who are settled here. The fine orchards, gardens, plantations of mulberry, plantane, and other trees, &c. afford some of the most delightful, pleasant, and shady walks that imagination can conceive. All the necessaries, and even luxuries of life, are excellent in their kinds, very plentiful, and quite reasonable: the wine in particular is exquisite, and the fish delicious. On a hill in the middle of the city there is a castle, which was once the palace of the sultans, but is now running to decay. The seraglio built by Mahomet the IVth, is a noble edifice. The city is governed by a bassa, a cady or moula, and a janissary aga, who has about 230 janissaries under him: in the suburbs, the Greeks have three handsome churches, the Armenians one, and the Jews four synagogues: in the city are some excellent hot baths, and about a mile from it the baths of Calypso, which are handsome structures covered with domes, and much frequented, on account of the great reputation the waters have obtained for their uncommon medicinal virtues.

Nice, or, as the Turks call it, Nickor, stands about 30 miles from Constantinople, in 40 deg. 32 min. north lat. and 29 deg. 40 min. east long. being situated near a gulph of the sea of Marmora, called Aliciano or Afcu; though its ancient splendor is much diminished it is still a considerable place, and contains about 10,000 inhabitants, Turks, Greeks, Armenians, and Jews, whose commerce is very great in corn, fruit, tapestries, fine cloths, and other merchandize brought from the Levant; there is a seraglio in the highest part of the town. The streets are large, and the houses well built. This city was celebrated for being the seat of the first general council convened by Constantine against the Arians A. D. 325, and since known by the name of the Council of Nice.

Nicomedia received its name from Nicomedes king of Bithynia, who made it his metropolis, resided in it, enlarged and embellished it. The appellation which the Turks give it is Ilinia, or Ilinigimid. It is large, handsome, and populous; and is situated at the end of a gulph of its own name, 40 miles north east from Bursa: in point of situation, it exceeds all the cities in the Turkish territories, Constantinople excepted: the inhabitants, composed of Turks, Greeks, Armenians and Jews, are supposed to amount to about 30,000, who carry on a considerable traffic in silks, cotton, woollen, and linen cloths, earthen ware, and glass; besides which, it is the principal place belonging to the Turks for ship-building. In many parts of the city curious ancient inscriptions in Greek and Latin are still visible; to the westward is a fountain of mineral waters, much admired for its medicinal qualities; and a little beyond there is a mole, supposed to have been formerly made for the security of the shipping in the harbour, which is about a quarter of a league long, and 12 yards broad. The gulph, which receives its name from this city, is only about a mile and a half broad, but is very long and deep.

Chalcedon, once an opulent city, is now an inconsiderable village with few remains of its ancient splendor; its situation is on the isthmus of a peninsula, about 17 miles to the eastward of Constantinople, on the opposite shore of the Bosphorus. This town anciently had in it a temple of Venus, and an oracle of Apollo; it has a tolerable harbour, and the river Chalcedon flows to the eastward of it.

Between Nicomedia and Chalcedon, the once opulent city of Lybyssa stands, which hath been famous for the death of Hannibal; it is now dwindled to a very poor and mean village.

Mysia and the Lesser Phrygia are usually described by geographers together, as the exact limits are not ascertained. In conjunction they are bounded on the north by the Propontis, on the south by Lydia and the Archipelago, on the east by Phrygia Major, and on the west by the Hellespont.

In this country, the famed mount Olympus is situated, or rather the double chain of mountains so denominated. They

They are thought to be the highest mountains in the eastern part of the universe, particularly the central part, or the celebrated Mount Ida of the ancients. These mountains are continually covered with snow, and the sides abound with pine and other trees, with wild thyme, and other shrubs, more particularly the laudanum cistus with broad leaves. About the beginning of the dog days the air of mount Ida is so serene that not a single breath of wind appears stirring, and at night the sun's rays appear to dart all round the horizon, which make it seem as if on fire.

The principal rivers in this part of the country are the Granicus and Elaphus, which discharge themselves into the sea of Marmora; and the Simeis and Xanthus, which empty themselves into the Hellespont; the Caicus, with the Pergamos and Cayster, flow through Mysia, which contains the following places, viz. Cyzicus or Cyzicum, which is now Chizico, and Spiga, though anciently a magnificent city, is at present but an inconsiderable town, situated about 30 miles westward of Bursa, on the south-east coast of the sea of Marmora. Opposite to this town, in the Propontis, are several small islands, which are called the Marble Islands from the great number of marble quarries in them; they likewise abound in corn, fruits, cattle, cotton, wine, &c.

Lampiscus, or Lamplaco, as it is now denominated, hath lost much of its ancient splendor: it is but a small city at present, thinly inhabited by a few Greeks and Turks: but its port is convenient. It is situated at the mouth of the Hellespont, opposite to Gallipoli in Europe. The neighbouring country is exceedingly fruitful in wines and pomegranates; the former even the indolent Turks themselves cultivate, and make excellent wine and brandy to mix with their sherbet.

Abydos, now called Avido or Avio, was formerly esteemed the key of Asia. It was here that Xerxes began his famous bridge, which was so well completed in a week, that 170,000 foot and 80,000 horse, inclusive of carriages and camels, marched over it. About 1235 years before Christ, a mine of gold was found near this city, which enabled Priam king of Troy to carry on many useful and magnificent public works. Philip of Macedon laid siege to this city, and took it by storm; but the citizens, sooner than be carried into slavery by the conqueror, set fire to the city, and then murdered their wives, children, and themselves. Abydos was once an episcopal see, Himerias the bishop thereof having assisted at the council of Chalcedon. In A. D. 1330, it was betrayed to the Turks by the treachery of the governor's daughter; and Avido is at present one of their castles upon the Dardanelles. It stands in 40 deg. 16 min. north lat. and 27 deg. 16 min. east lon. upon the strait that divides Asia from Europe, which is three miles over.

The principal places in the Lesser Phrygia are, Afios, formerly a considerable sea-port town on the south coast, now an inconsiderable village.

Antandros, now called St. Demetri, is situated farther east of the foot of mount Ida. Though it was anciently a place of importance, it now scarce deserves mentioning.

Atramyttum, or Endromis, as the Turks call it, stands at the mouth of the gulph to which it gives name, opposite to the island of Lesbos. At present, like the last mentioned places, it is not of the least importance, though formerly it was a place of note, and is mentioned in the Acts of the Apostles.

Pergamus, which was formerly the metropolis of a kingdom is now dwindled to a small village. The decay of great cities, of which the vestiges scarce remain, and the ruins of ancient splendor, give the best moral lessons to the speculative mind. In the instability of human glory, and the mouldering remains of the strongest and most magnificent structures, we may perceive and be taught to reflect on our own approaching mortality, and the general dissolution which must await all sublunary things. These melancholy reflections, however, are not only instructive, but admit of being blended with the most sublime and pleasing ideas: well may we exclaim with Webster,

"I love these ancient ruins;
We never tread upon them but we sit

"Our foot upon some reverend history,
"And questionless, herein this open court
"Which now lies naked to the injuries
"Of stormy weather, some may be interr'd
"Who lov'd the church so well, and gave so largely to't,
"They thought it should have canopy'd their bones
"Till dooms-day; but all things have their end,
"Churches and cities, which have diffeals like to men,
"Must have like death that we have."

Pergamus, or Pergamos as the Turks call it, is situated 60 miles north of Smyrna on the banks of the Caicus. Here stood one of the seven churches mentioned in the Revelations: here also the celebrated physician Galen was born, and parchment invented, the word itself being only a corruption of Pergameum, from Pergamos. Some affirm, that tapestry was likewise first invented at this place. A stately temple of Esculapius once embellished this town. The Turks have here a mosque, and the Greeks a church.

Troas Alexandria, to the southward of Troy, was formerly the capital of the province, but is now totally in ruins.

It is not positively agreed among the learned, whether the supposed ruins of Troy really belonged to that celebrated city, or to the above mentioned Troas Alexandria. We shall, however, speak of Troy from the best authorities.

It is said to have been situated on a rising ground near mount Ida, and about five miles from the shore of the Ægean sea on the river Scamander, or Xanthus. The ancient geographers place it in 39 deg. 58 min. north latitude, and 27 deg. 56 min. east longitude. Strabo informs us, that there were scarce any remains of it even in his time. The best account of the Trojan war is given by Homer; the narrative, stripped of the poetical fictions, appears to be genuine, from the concurrent testimonies of the most creditable historians of antiquity, and of the Arundelian marbles. The number of ships employed to transport the troops, according to Homer, was 1186; but Thucydides exceeds even the poet, and makes them 1200 sail. The Boeotian ships were the largest, and carried 120 men in each; the ships of Phœciæ were the smallest, and only carried 50 in each. Troy, however, held out ten years against the formidable army of the Greeks, who, when they took that devoted city, set it on fire and put most of the inhabitants who did not escape to the sword. Æneas in relating to queen Dido the circumstances of the fatal night in which Troy was taken, says,

"Pantheus, Apollo's priest, a sacred name,
"Had leap'd the Grecian towers, and paid the flame;
"With relics laden to my door he fled;
"And by his hand, his tender grandson led;
"What help! oh Pantheus! whether can we run,
"Where make a stand? or what may yet be done?
"Scarce had I said, when Pantheus with a groan,
"Troy is no more, and Ilium was a town:
"The fatal timer, th' appointed hour is come,
"When wrathful Jove's irrevocable doom
"Transfers the Trojan state to Grecian hands;
"The fire consumes the town, the ice commands."

According to the most authentic records, Troy was taken April the twenty fourth 1184 before Christ; and its capture put an end to the kingdom of Troy, after having stood 296 years from Teucer to Priam. This remarkable event induces us to give Virgil's interesting account of the death of Priam, as it is elegantly translated by Dryden.

Pyrhus, the son of Achilles, having pursued Polites, one of Priam's sons, to a place where that unhappy monarch had taken refuge, runs him thro' the body with a lance:

"The youth transfix'd, with lamentable cries
"Expires before his wretched parent's eyes,
"Whom gasping at his feet, when Priam saw,
"The fear of death gave place to nature's law;
"And trembling more with anger than with age,
"The god's, said he, require thy brutal rage," "As

"As sure they will; barbarian, sure they must,
 "If there be gods in heav'n, and gods be just,
 "Who tak't in wrongs an insolent delight,
 "With a son's death t' infect a father's sight.
 "This said, his feeble hand a javelin threw,
 "Which flutt'ring seem'd to loiter as it flew,
 "Just and but barely to the mark it held,
 "And faintly check'd on the brazen shield:
 "Then Pyrrhus thus, Go thou from me to Fate,
 "And to my father my foul deeds relate:
 "Now die—with that he dragg'd the trembling fire,
 "Slidd'ring thro' clotter'd blood, and holy mire;
 "His right hand held his bloody falchion bare,
 "His left he twist'd in his hoary hair,
 "Then with a speeding thrust his heart he found,
 "The luke warm blood came gushing thro' the wound, }
 "And sanguine streams distill'd the sacred ground. }
 "Thus Priam fell, and shad'd one common fate
 "With Troy in ashes, and his ruin'd state:
 "He, who the sceptre of all Asia sway'd,
 "Whom monarchs like domestic slaves obey'd,
 "On the bleak shore now lies th' abandon'd king,
 "A headless carcase, and a nameless thing."

We cannot here forbear transcribing the following passage from the ingenious *marquis D'Argens's Jewish Spy*: "The ruins of the cities in the Archipelago have for several years engaged the curiosity of travellers, yet the Turks lessen them every day, and carry away vast quantities of the marble. How much therefore must there have been of it at first! The mosque of the sultan Achmet was built only of the stones fetch'd from the ruins of Troy; the columns which form the peristyle of that temple, and which are not less than 130 in number, were found all entire in the fields of that ancient city. For near 200 years the Turks made use of no other bullets for the cannon of the Dardanelles, than Corinthian chapters and columns, which they broke to pieces, and then cut to make them serve that purpose."

Æolis is a peninsula on the north by the Lesser Phrygia, on the west by the Egean sea, on the east by Lydia, and on the south by the sea.

The cities were formerly Myrina, Cuma, Elaea, and Phocæa. Myrina is called by the Turks Marham, and Phocæa, Foggia, or Foggia; at present they are all four of so little importance, that were they united together they would make but a very inconsiderable village.

Ionian lies contiguous to *Æolis*, and contains, among others, some places of importance, the principal of which is Smyrna.

Smyrna, which the Turks call *Ismyr*, or *Ismir*, lies 38 deg. 15 min. north lat. and 27 deg. 10 min. east long. It is the best sea-port town in the Levant, and the most populous and opulent city of Asia Minor. From Constantinople it is eight days journey by land, and about 133 leagues by water.

In the time of the Romans, Smyrna was looked upon as the most beautiful of the Ionian cities, and was called the *Ornament of Asia*. A Turkish rebel nam'd *Tzachar*, in 1084, thought proper to assume the title of king, and having seized upon Smyrna, made it his capital. At the beginning of the 13th century it all lay in ruins except the fortress. In 1424 it was finally subdued by the Turks, having been previously rebuilt at various periods.

The port which is shut up reached once to the foot of the castle, but is now dry, except after a few heavy showers, when it is replenished from the sluices.

The public edifices have generally been erected by the Turks with the materials of the ancient city. The bazaar, or market, and the *Tizir-Khan* were both raised with the white marble of the theatre. The commodious harbour and advantageous situation have rendered it one of the most opulent cities in Turkey. The haven is defended by a strong castle, and sheltered from all winds except the westerly by high mountains. There is an astonishing conflux of people in Smyrna of several nations, who differ in manners, dress, language, religion, &c. The Turks occupy the greater part of the town; the Protestants and Roman Catholics have their chapels, and the Jews a synagogue or two. The Armenians

have a large handsome church, with a contiguous burying ground. Doctor Chandler says, "The Greeks before the fire had two churches. They applied by their bishop at Constantinople, to rebuild that which was destroyed, but the sum demanded was too exorbitant to be given. By this policy the Turks will in time extirpate christianity from among their vassals."

The mosques, baths, market and khans are the principal buildings, and some of them are very noble; the streets in general are narrow, inconvenient, and intricate; but the most disagreeable circumstance to those who live here is the great heats, which commence in June, and continue till September. During this season the ground is burnt up, and has large chafins, which it is imagined give vent to bituminous vapours, that, if confined, would occasion earthquakes. Few years pass without a flock or two, but in general they are less hurtful than alarming. They usually happen when the weather is calm in spring and autumn, at which time the sea withdraws a considerable way from the beach, and the water is exceedingly low; a terrible one happened in 1688, which overthrew a great part of the city. Smyrna is likewise annually visited by the plague; when it rages violently, the consuls, factors, merchants, &c. retire into the country; and many people abandon their dwellings to live abroad under tents. The islanders return home, and the grass is seen to grow in the streets of the Franks quarter, which is exceedingly populous at other times.

The Turks bury without the town, and place either grave stones or pillars at the head and feet of the graves, which in general are shaded with cypress trees. In their cemeteries, as well as those of the Christians and Jews, many antiquities in architecture are found: the burying ground, belonging to the English, is walled in, and contains some curious monuments, the sculpture of which is admirable. They were, however, not executed at Smyrna, but brought from Italy; one in particular is to the memory of Mr. Bouverie, (the companion of Meli, Wood and Dawkins in their journey to Palmyra) who died at Magnesia.

Smyrna is plentifully supplied with provisions: the tails of some of the sheep weigh ten pounds, and are deemed a great dainty. The fish taken in the bay are excellent; wild hogs, hares, and all other kinds of game, fowls, &c. may be had in abundance; the wine, olives, fruits, &c. are all admirable. The musquitoes, as well as a much smaller fly, of which the name is not known, are extremely troublesome, but more so to strangers than natives; lemon juice is the best remedy for the fiery tumours which ensue. In the harbour of Smyrna are always ships of almost all nations, and all burthens. The town is supposed to contain about 15,000 Turks, 10,000 Greeks, and 2,000 Jews, exclusive of Armenians, Franks, &c. The Franks quarter is better built and better paved than any other. The European merchants bring hither a great variety of goods from Europe, the East and West Indies, &c. export fine and coarse wool, silk, cotton, mohair, wax, rhubarb, gall nuts, opium, aloes, scammony, tutty, galbanum, tacamahac, gum-ragacanth, ammoniac, and Arabic, myrrh, frankincense, zedoar, &c. The Jews here, as well as in most parts of Turkey, generally manage all commercial affairs; or at least the principal part of them goes either directly or indirectly through their hands. The whole town, in fact, is one continued bazar or fair; the consuls from England, France, and Holland, have very handsome houses by the sea side. This city is one of the seven that contended for the honour of being the birth place of Homer, to whose memory a temple was built; it is likewise the seat of one of the seven Asiatic churches mentioned in the Apoclypse. In the environs, Roman medals have been frequently found; near it are the remains of an ancient Roman circus, theatre and other ruins, &c. In the neighbourhood a kind of earth is found, which being boiled with oil makes excellent soap. The whole country is exceedingly rich and fertile.

Clazomene is situated on the Ionian peninsula, about 28 miles to the south west of Smyrna; it was one of the twelve ancient cities of Asia, and famed as the birth place

place of Anaxagoras. It is now called Urla or Vourla; it was a city of importance in the time of the Romans, but is now a despicable village, and better known in the historians page for what it was, than for any thing worth noticing in its present situation.

- "When rust shall eat her brass, when Time's strong hand
 "Shall bruise to dust her marble palaces,
 "Triumphal arches, pillars, obelisks;
 "When Julius' temple, Claudius' aqueducts,
 "Agrippa's baths, and Pompey's theatre;
 "Nay, Rome itself shall not be found at all,
 "Historians books shall live."

Erythraea, like the last mentioned place, was formerly a considerable city; but by the same kind of fatality is now dwindled to an inconsiderable village. It is on the Ionian coast, between Teos and Clazomene.

Teos, the birth place of Anacreon, was anciently a good sea-port, but is now scarce the shadow of what it formerly was.

Lebidus, or Lebidos, is now a poor sea-port, near the isthmus of the peninsula, though it was formerly one of the twelve capital cities of Asia, and was famed for the Games of Bacchus, which were celebrated there.

About 30 miles south of Smyrna is the city of Colophon, one of those which laid claim to the birth of Homer; it had a temple and an oracle, but at present is very inconsiderable.

Ephesus is in 38 deg. 16 min. north lat. and 27 deg. 3 min. east long. It lies about 50 miles south of Smyrna, 23 from Miletus, and 63 from Laodicea, and was anciently the metropolis of all Asia; Ephesus and Smyrna, having been termed the eyes of Asia Minor; but of this once splendid, opulent, and magnificent city, nothing remains but about 30 houses inhabited by Greek families, who are miserably poor, and so exceedingly ignorant, that none of them are able to read the admirable epistle with which St. Paul honoured them: its first bishop was Timothy, whom St. Paul appointed to that ministrations; St. John the Evangelist was buried here.

The Greeks call this city Efeso, and the Turks have given it the name of Ajafalouch. There are many noble ruins, particularly of an aqueduct, a theatre, and a circus. The celebrated painter Parrhasius, and the weeping philosopher Heraclitus, were natives of this place. The principal ornament of Ephesus was the celebrated temple of Diana, one of the wonders of the world. It was built at the foot of a mountain and the head of a marsh, which situation was chosen, as Pliny informs us, because less subject to earthquakes. Four hundred years were spent in building this wonderful temple. It was 425 feet in length and 200 in breadth, being supported by 117 marble pillars 70 feet in height, of which 27 were most curiously carved, and the rest admirably polished: the temple of Diana was burnt by Erostratus, through no other motive, as he himself confessed upon the rack, than to eternize his name. This remarkable transaction happened the very day on which Alexander the Great was born, in the year of the world 3950, of the flood 2644, and 350 before Christ. There is yet standing a church dedicated to St. John, which was erected by the primitive Christians, but is at present converted into a Turkish mosque. We shall conclude this article with a quotation from an ingenious modern traveller. "The Ephesians are now a few Greek peasants, living in extreme wretchedness, dependence, and infensibility, the representatives of an illustrious people, and inhabiting the wreck of their greatness; some the substructions of the glorious edifices which they raised, some beneath the vaults of the stadium, once the crowded scene of their diversions, and some by the abrupt precipices in the sepulchres, which received their ashes. We employed a couple of them to pile stones, to serve instead of a ladder, at the arch of the stadium, and to clear a pedestal of the portico by the theatre from rubbish. We had occasion for another to dig at the Corinthian temple, and sending to the stadium, the whole tribe, ten or twelve followed, one playing all the way before them on a rude lyre, and at times

striking the sounding board with the fingers of his left hand in concert with the strings; one of them had on a pair of sandals of goat-skin, laced with thongs, and not uncommon; after gratifying their curiosity they returned back as they came with their musician in front. Such are the present citizens of Ephesus, and such is the condition to which that renowned city has been gradually reduced. It was a ruinous place when the emperor Justinian filled Constantinople with its statues, and raised its church of St. Sophia on its columns. Since then it has been almost exhausted;" and again, the same author says, "the glorious pomp of its heathen worship is no longer remembered, and Christianity, which was there nursed by apostles, and fostered by general councils, until it encreased to fulness of stature, barely lingers on in an existence hardly visible."

Caria is bounded by the Icarian sea on the south and west, by Ionia and the river Meander on the north, and by Phrygia and Lycia on the east; the principal places are, Miletus or Miletum, formerly one of the most considerable cities of Asia, but it has dwindled to a mean village called by the Turks Palatichia. It stands on the south side of the Meander near the sea coast, and was the birth place of the celebrated philosopher Thales. Several magnificent ruins are still visible.

There are scarce any vestiges left of the ancient cities of Heraclea, Lathinum, Beryglia, Mylasia, Amyzon, Alabanda, Stratonicæ and Alinda.

Halicarnassus was formerly the metropolis of Caria, and has been celebrated in history for the mausoleum, or tomb built by queen Artemisia, in honor of her husband king Mausoleus, which was of so noble a structure that the ancients deemed it one of the wonders of the world. Hence all tombs, which are remarkable for being superb, are called mausoleums. Their monuments of pretended respect to the dead, and real vanity of the living, bring the following lines to our remembrance:

- "Can pomp and pride make difference in our dust!
 "Go cast a curious look on Helen's tomb:
 "Do roses flourish there, or myrtles bloom?
 "The mighty Alexander's grave survey;
 "See, is there ought uncommon in the clay;
 "Shines the earth bright around it, to declare,
 "The glorious robber of the world lies there;
 "What, Egypt, do thy pyramids comprize,
 "What greatness in the high-raised folly lies!
 "The line of Nilus this poor comfort brings,
 "We sell their dust, and traffic for their kings."

Mindus is a sea-port on the Jasic bay, about twelve miles from Halicarnassus; the Turks called it Mentes; it is at present the chief town in these parts, and the residence of a Turkish sangiac; anciently it was but a small town, yet the Greeks being uncommonly sumptuous and large, Diogenes, in ridicule of the vanity of the inhabitants, told them to take care that their little city did not run away through its own gates.

Lydia or Maonia is bounded on the east by Phrygia, on the west by the Archipelago, on the north by Mylia, and on the south by Caria. It was anciently called Maonia, and was once the kingdom of the celebrated Croesus.

It is a fine fertile country, being watered by the Caicus, Heymen Cayster, Meander and the Pactolus, so celebrated by the ancient poets for its sand of gold. Tmolus, famed for its wines and fission, is the principal mountain in this country. At present the indolent Turks suffer this fine country to be over-run with brambles, and to lie entirely uncultivated. The chief places are,

Sardis, formerly the metropolis of Lydia, and the seat of the rich king Croesus, is now a very inconsiderable village, seated on the banks of the Pactolus, at the foot of mount Tmolus. It is about 48 miles east of Smyrna, and only inhabited by shepherds. It however contains a large caravanserai for the accommodation of travellers and caravans, who pass through it from Smyrna and Aleppo in their way to Persia. The magnificent ruins that are still visible, give however an idea of its ancient splendor to the beholder. It was one of the seven Asiatic churches. Philadelp.

Philadelphia, another of the seven churches, was formerly a very populous city, and is still a tolerable town containing about 7000 inhabitants, who are principally Greeks. It is filled with the ruins of many superb edifices. Here are four churches; and as the neighbouring country is very fertile, provisions are pretty plenty. The Turks call it Alla-Scheur, or the City of God.

Thyatira, or as the Turks call it, Akifhar, was another of the seven churches. It stands upon the banks of the Hermus, on the confines of Mysia, about 26 miles north from Sardis, and 56 north east of Smyrna; the houses are low and mean, being built with mud and turf. It contains about 5000 inhabitants, who are chiefly Turks. The only manufacture is that of cotton. The neighbouring plains are full of cotton trees and tamarisks.

Magnesia, or Siphylus, as it hath been called to distinguish it from that in Ionia, or Suzletellur as the Turks name it, was anciently a city of great opulence and importance, pleasantly situated at the foot of mount Siphylus, about 70 miles south east of Smyrna. The walls are in tolerable preservation; the inhabitants are composed of Turks and Jews, the latter having three Synagogues. It is now but a small trading town, having a manufacture of cotton yarn.

Tripolis is situated on the frontiers of this province towards Caria, and the river Meander; it is fallen from its ancient splendor and is now a very poor village; the Turks call it Koenikoi.

Dinghisly is a handsome trading town, well peopled with Turks, situated at about 70 miles distance from the mouth of the Meander.

With respect to the ancient cities of Tralles or Trallia, Hiero-Casarea, Narrada, Egria, Jovis-Tanum, and Ludicea, there are scarce any vestiges left except of the latter, which was a noble city, and one of the seven churches; the ruins that are visible are of a circus, and three theatres of white marble which are almost entire; the place is however uninhabited.

Phrygia Major is bounded on the north by Bithynia, on the south by Pamphylia; on the west by Mysia, and on the east by Galatia; it is watered by the rivers Hermus, Meander, Marisus, and Sangarius, and would with proper cultivation be exceedingly fruitful. The Turks call this country German; the remarkable places are,

Cotyrium, or Kutahia, as the Turks call it, which stands on the river Sanger, about 75 miles south east of Bursa. It was a very considerable city anciently, and is still a very flourishing populous town: it is at present the seat of a beglerbeg, and was formerly the Turkish emperor's place of residence, prior to the taking of Constantinople.

Mideum or Midæum, was anciently the regal seat of the celebrated king Midas, of whom it is recorded, that when he was a child, a swarm of ants were observed very busy one day, while he was asleep, in conveying their stores of wheat into his mouth, whereupon the oracle being consulted, returned answer, that immense riches were prefiged by that omen. The prediction was fulfilled, for he was accounted by ancient authors one of the richest princes that ever reigned. Strabo says, he drew immense sums from the mines of mount Bermius; the fable of Midas's having asses ears originated from his being of a very suspicious temper and employing many spies in different parts of his dominions, by which means scarce any transaction could be concealed from his knowledge; this induced his subjects to say metaphorically that he had long ears, and as asses are said to be endowed with the sense of hearing in a greater degree of perfection than any other animals, they likewise said he had asses ears; but what was spoken metaphorically came at last to be vulgarly imagined a fact. His wish to be able to change every thing he touched into gold, the grant of that wish, and the consequent punishment, which was that even his food became gold, and he was in danger of being starved, by having the completion of his wish, are all likewise metaphors, and alluded to his avaricious temper, which was never to be gratified with the heaps of riches he possessed, but always craving for more, and aiming to turn all he could into money. Well sings the poet;

"Fond men by passions wilfully betray'd,
"Adore those idols which their fancy made;
"Purchasing riches with our time and care,
"We lose our freedom in a gilded snare,
"And having all, all to ourselves refuse,
"Oppress'd with blessings which we fear to lose;
"In vain our fields and flocks increase our store,
"If our abundance makes us wifh for more."

How miserable is the miser, and how happy those who think, that

"We to ourselves may all our wishes grant,
"For nothing coveting, we nothing want."

The ancient geographers placed Mideum near the north east limits of Phrygia, on the river Sangarius; but there are no vestiges of it at present to be seen.

Gordium was once the residence of Gordius king of Phrygia, celebrated for having tied the famous knot in the temple of Apollo, which was known by the name of the Gordian Knot; Alexander the Great afterwards not being able to untie it, cut it with his sword.

Colosse, Colossus, or Chonos, was situated on the south side of the river Meander. St. Paul's epistle to the Colossians was addressed to the inhabitants of this city.

Of the three last mentioned cities, as well as Hierapolis, Symrada, Eucarpia, Prymnesia, Tiberiopolis, Hipios, &c. scarce any traces are now to be found, except the hot springs, and superb ruins of Hierapolis.

Apamea was once one of the most considerable cities of Asia, but is now quite run to decay. It was situated on the river Meander, a little above where the Marcias falls into it, and arose out of the ruins of the ancient Celene, whose inhabitants were transplanted into it by Seleucus, who named it after his wife Apamea.

Galatia, by the Turks at present called Chagare, is bounded on the north by Paphlagonia, on the south by Pamphilia, on the east by Cappadocia, and on the west by Phrygia Major. It received its name from a colony of Gauls, who passed through Greece into Asia, and settled in it. A great number of Greeks afterwards mingled with them, whence it was called Gallo-Græcia: it was always a fine fertile country, and formerly it was well cultivated, but at present lies neglected like other places, through Turkish indolence. The inhabitants were among the primitive christians, as appears by St. Paul's epistle addressed to them.

Ancyra, or as the Turks call it, Angouri, or Angora, is in 40 deg. north lat. and 32 deg. 58 min. east long. 250 miles east of Smyrna. It is the residence of a sangiac, and a very populous trading place. The inhabitants are estimated at 40,000 Turks, 5000 Armenians, and 1000 Greeks. The chief manufacture was camlets; the evidences of its primitive grandeur are innumerable; the streets, piazzas, &c. being full of stately remains, columns, &c. of the finest marble, porphyry, red jasper, and other beautiful stones, elegantly wrought; the modern buildings, however, are mean, low, and formed only of mud and turf. A great variety of inscriptions in several languages appear upon the gates. In the castle there is an ancient little dark Armenian church, built 1200 years ago. It has only one window which is not glazed, but hath its vacancy filled by a transparent marble through which the light penetrates into the church, but receives a reddish tinge from the nature of the stone. This city was once an archbishop's see, with six suffragans under him. The sheep bred here are some of the finest, and the goats the most beautiful in the universe; the hair of the latter is of a dazzling whiteness, as fine as silk. It is curled naturally into locks of 8 or 9 inches long, which make the finest camlets. This hair is spun in the country, and manufactured at Angora. These goats are only to be seen within a few miles of the city, as the breed degenerates if they are carried further.

Heli is the metropolis of the province, and the residence of one of the 15 sangiacs under the beglerbeg of Anatolia Proper; the other places are Andros situated a little to the east of Ancyra, Thenna, so called from its hot baths; Germalle, formerly Germa, on the Sangarius; Ophium, a dirty ill built town, which receives

its name from the opium made in and about it, its environs being covered with poppies, from which the Turks extract their opium.

The ancient cities, Tabia, Cinna, Aspona, Reganagalia, Pifinus, Heliopolis, Regemnerus, Marcium, Pelinefus, Clancas, Acorium, Regennocade, Myracium, Eudoxias, and Amorium are either totally in ruins, or dwindled to such trifling villages as to scarce deserve mentioning.

Pontus and Paphlagonia are contiguous, both lying to the north of Galatia, and being divided from Cappadocia on the east by the river Halys, and on the west by Metapontus.

Paphlagonia was anciently inhabited by the Heneti or Veneti, from whom the Venetians are descended. The Turks call this country Pender; the principal places of which are,

Heraclea Ponti, like many of the beforementioned cities in the Turkish dominions, was formerly a very important, but at present is a very inconsiderable place. It stands on the Euxine sea, on the ruins of the ancient Heraclea. It was once celebrated for being the residence of the Comma family, the founders of the Trebizonde empire. The houses are small, mean, and ill built; but the gates, towers, walls, &c. contain many fragments of the grandeur of the ancient city. The Turks call it Penderachi.

Claudianopolis, about 35 miles south of Heraclea, is a very small town, though once an episcopal see.

Amastris, at the mouth of the river Parthenius, called by the Turks Amastro, is now a very obscure mean town, though anciently an important sea port.

Teuthramia, now Tripoli, is still a good town on a bay of the Euxine sea; but it must be observed that there is a town of the same name in Anatolia, situated on the Meander.

The following cities, though formerly considerable, are now either totally deserted, or nearly in ruins; and having never been very remarkable, they certainly in their present decayed state are too insignificant to have anything said about them except the bare mention of their names, which are Amafus, now Amid; Gangara, now Zagyra; Junopolis, now Cinopolis; and Pompeiopolis, or Cimolis.

The most considerable city in this part is Sinope, which was anciently the metropolis of the kingdom of Pontus, and the birth and burial place of the celebrated king Mithridates. It is at present a good trading town, being in 41 deg. 14 min. north lat. and 34 deg. 52 min. east long. In Strabo's time most of the stately walls, edifices, and the castle were standing. The walls, which now surround it, were built by the Greek emperors. They have double ramparts, and are flanked with pentagonal and triangular towers. On the land side, however, it is commanded by eminences which would greatly expose it to an enemy, but by sea it would require two fleets to besiege it; the castle is now run to ruin, and there are but few janissaries in it; yet the Turks are so jealous of it, that they suffer no Jew to live in it, and confine the Greeks to a certain suburb. Here is a profitable fishery, and a great deal of trade carried on. Many magnificent antique remains are to be seen, and the new buildings are intermixed with innumerable noble fragments of the old. The water is excellent, and the country fertile, abounding with walnut, olives and maple trees, and a fine sort of wormwood. Diogenes, the celebrated cynic philosopher, was a native of this place.

The honourable J. Ægidius Van Egmont, envoy extraordinary from the United Provinces to the court of Naples, in reciting his travels through Anatolia says, "In the country are great numbers of storks, which afford the inhabitants an odd kind of diversion. They place hens eggs in the stork's nest, and when the young are hatched, the male, on seeing them of a different form from its own species, makes a hideous noise, which calls together a crowd of other storks hovering about the nest, and who, to revenge the disgrace that the female has in appearance brought on her nest, destroy her, by pecking her to death; the male in the mean time making the heaviest lamentation, as if be-

wailing his misfortune, which obliged him to have recourse to such disagreeable feverities.

"Here I also saw the creature called Cameleon: it was found among the ruins of Old Smyrna castle. The creature was pretty large, and I saw it change its colour three several times, becoming black, white, and green. It was placed on a piece of red cloth, and often turned, but never assumed that hue: whether the creature was too large, and the smaller only imitate this colour, or from any other reasons, is beyond my philosophy to determine. With regard to its food during the eight days it lived with us, I did not observe it to eat any thing, except small flies, which it caught in the air with its tongue."

S E C T. XI.

AMASIA.

AMASIA is bounded on the north by the Euxine Sea, on the south by Caramania and Aladulia, on the east by Armenia, and on the west by Anatolia Proper, and is governed by a beglerbeg.

The capital of the province and the residence of the beglerbeg is the city of Amasia, which the Turks call Amasahan. It is about 60 miles from the Euxine Sea, and 40 east of Tocat, situated on the river Iris, or Calsalmach as it is now called. Though the city itself is large, the commerce is inconsiderable; the river, however, is navigable for ships of great burthen up to the town itself. On a mountain to the east there is a strong castle, and a wooden bridge over the river. Selim the first emperor of the Turks, and Strabo the celebrated ancient philosopher, were born here. There are only two caravanseras at present in the city. The magnificent fragments of antiquity, which are found in abundance in and about this city, evidently prove that it was formerly a place of great beauty and importance.

Lerio, or, as it was anciently called, Themiseyra, was one of the strongest and most important cities of Pontus, but at present it is but a trifling place, situated on the sea coast, near the mouth of the river Thermodan, about 60 miles to the north east of Amasia.

Comana or Pontica, was formerly a great city, but is now only a mean straggling village; it is about 40 miles from Amasia, situated upon the Iris, or Calsalmach.

Sivas, which authors imagine to be the ancient Sebaste, is at present a little scattered village, situated about 55 miles south of Tocat, and 75 south east of Amasia; yet mean as it is, a bazaar, superior to that of Tocat, resides here, and an aga with a few janissaries under his command.

Phamacia is about 44 miles west of Trebizonde, and situated near the coast of the Euxine Sea; the Turks call it Kerisan; it is a large populous town, but its harbour is only fit to receive those small vessels called saics. It is generally imagined to be the ancient Cerasunta, and is supposed to have been so denominated on account of the great number of cherry trees which grow in its environs.

Trebizonde, Trapezonde, Trabzonde, or, as the Turks call it, Tarabozan, is situated in the ancient Pontus Cappadocia, on the eastern parts of Amasia, at the foot of a hill. It is a kind of peninsula running into the Euxine sea. It lies in 41 deg. 5 min. north latitude, and 39 deg. 22 min. east longitude, at about 18 miles distance from Tocat. This city was anciently very important from being the metropolis of the Trebizonde empire. It is still a place of great trade, and was said to contain 20,000 inhabitants prior to the year 1617, when it was burnt by the Russians; since that period it hath been but thinly peopled, though a Turkish bazaar and a Greek archbishop reside in it. The houses are mean, and ill built. The castle is large and built on a rock, out of which the surrounding ditches are cut. The harbour is in very bad condition, and will only admit small Turkish barks. The city is in the form of an oblong square, and derived its name from Trapezus, a table, from whence we likewise have the word Trapezium, a geometrical term for an oblong square, whose angles and sides are consequently unequal. are high and strong, defended by towers, battlements, &c. it is celebrated in history for having been the birth place of many eminent men, and more so on account of the martyrdom of 40 christian soldiers, who were thrown into a frozen lake in the neighbourhood, by the order of Licinus. The environs, though little cultivated, are very fertile; the neighbouring mountains are covered with stately woods of various trees, such as oaks, elms, beech, &c. which are of an astonishing height, and the whole face of the country forms an agreeable landscape. The finest forest lies about 25 miles south of the city, in the midst of which stands the famous convent of St. John, built all of wood, upon a high rock, and surrounded by one of the most romantic wildernesses in the universe. A great deal of rock-honey is found in the neighbourhood of this city, which is so exceedingly luscious as to render the eating much of it dangerous. Tournefort ascribes this rich quality to the nature of the flowers from which the bees extract it. In the city, the gardens and groves are as numerous as the houses; but the suburbs, which are inhabited by Greeks and Armenians, are both more extensive and more populous than the city itself.

The empire of Trebizonde was founded much about the time of that of Nice, by David and Alexius Armeni, who were the grandsons of the tyrant of Iconium. Having escaped from Constantinople, they seized upon the Eastern parts of Pontus, Galatia and Cappadocia, and erected the whole into an empire. This empire was founded A. D. 1204, and continued about 258 years. But in 1462, Mahomet the second, surnamed the Great, conquered the whole, and having put to death all the remains of the Comneni family, added it to the Turkish empire. Thus flates rise and fall, their greatness only being the preface of their dissolution.

- "When empire in its childhood first appears,
- "A watchful fate observes its tender years;
- "Till grown more strong, it thrusts and stretches out,
- "And elbows all the kingdoms round about;
- "The place thus made for its first breathing free,
- "It moves again for ease and luxury;
- "Till, swelling by degrees, it now possesses'd
- "The greater space, and now crowds up the rest:
- "When, from behind, there starts some petty state,
- "And passes on its now unweildy fate;
- "Then down the precipice of time it goes,
- "And sinks in minutes, which in ages tole.

DRYDEN.

Tocat or Neocæsarea, was anciently the metropolis of Pontus Polemoniacus. It lies in 39 deg. 48 min. north latitude, and 30 deg. 58 min. east longitude; and, besides being the residence of the beglerbeg of the province, is a considerable thoroughfare for the caravans to Smyrna. It stands partly at the foot, and partly on the sides of two very high hills, on the river Tolanlu, which is supposed to be the Lupus of Pliny, that falls into the Iris some miles below Tocat: both rivers frequently swell and overflow the country. The town is large, strong, and well built, in the form of an amphitheatre: on the top of two marble rocks are two old castles. Every house hath a fountain of fresh water in it, as the rocks abound with fine springs. Yet, though water is so plentiful, it was destroyed by fire in the beginning of the present century, and many eminent merchants were thereby totally ruined. It soon recovered, however, through the excellency of its situation, and is now deemed the center of Asiatic commerce: the caravans come from Diarbec in 18 days: those of Tocat go to Sinope in six days, and to Prusa in 20; but such as go directly to Smyrna, without passing through Prusa or Angora, take up about 40 days with camels, or 27 with mules. The environs are extremely fertile, some excellent plants are produced, and curious fossils found, particularly many subterraneous vegetations of admirable beauty. Like our flints they are enclosed in matrices, which when broken display some of the finest crystallizations imaginable; some are like petrified mother-of-pearl, and others appear like candied lemon and orange peel. This city is governed by a cadi or cady, a vay-

vode and a janissary aga. The garrison consists of about 1000 janissaries and spahis. The city and suburbs are supposed to contain 20,000 Turkish, 4000 Armenian, and about 500 Greek families. It has 12 mosques with minarets, and many without; seven Armenian churches, and one Greek chapel. Before the abovementioned fire it contained 12 Christian churches, one of which was archiepiscopal. The archbishop has seven suffragan bishops. There were likewise two monasteries, and two nunneries. The manufactures are of silk, leather, red linen, and copper worked into a variety of utensils. About two miles from the town are two small rooms cut out of the solid rock, and held in great veneration by the Christians, who suppose it to have been the retreat of St. Chrylston, during the time of his exile.

It may not be improper to observe that Amasia contains the whole or the principal part of the ancient provinces of Pontus Cappadocia, Pontus Polemoniacus, and Pontus Galaticus.

SECT. XII.

ALADULIA.

ALADULIA, or Anadulia, or Dulgadir, as the Turks call it, is the third division of Asia Minor. This country is united to the purposes of agriculture, being rough and hilly, but it abounds in excellent pastures, and produces abundance of admirable fruit, wines, and cattle, particularly horses and camels, besides vast herds of goats and sheep, venison, all kinds of game, &c. The mountains contain silver, copper, iron, alum, &c.

The province is divided into four sangachips, which are again subdivided into zarinetts and timariots. The plundering banditti, or free-booters, are very troublesome in this country. The principal places are,

Cæsar, the ancient Cæsarea; it is a large town on the banks of the Milas, near mount Argeus, and about 70 miles west of Scias. The walls are strong, and flanked with towers. The castle is in the centre of the city. The bazar is handsome, and well furnished with all sorts of merchandize; the houses in its neighbourhood are built either in the form of a tower with a cupola, or they resemble a sugar-loaf. The city is well supplied with water from the river; and their principal trade is in cotton.

Malathiah, at the confluence of the Euphrates and Arsu, was antiently called Melitene. It is in 38 deg. 22 min. north latitude, and 38 deg. 56 min. east longitude. It was formerly the seat of the Ottoman princes, and now of a Greek archbishop. It is still a considerable town.

Mars, or Marasch, is a large well-built city in the south-east boundaries of the province. It is situated on a small river, which falls into the Euphrates about 180 miles to the southward of Trebizonde: it is a place of some commerce, and the residence of a basha.

Antiently there were many fine cities in this country, such as Tyana, Nyssa, Nazianzum, &c. which at present are either heaps of ruins, or such mean villages as not to merit the least mention. Among the eminent men who were born in this province, the foremost upon the list are Pausanias the Greek historian, the two Gregories of Nagianzen, St. Basil, and St. George the patron of England, of whom we shall speak a few words.

St. George was born in the latter end of the third century, of Christian parents; he served in the army of the emperor Dioclesian with great reputation for some time, when that monarch relapsing on a persecution of the Christians, and being unable to win over St. George to Paganism, he ordered him to be put to the torture, which not shaking his constancy, he was beheaded by the command of that tyrant on the 23d of April, A. D. 290. St. George being represented on horseback and tilting at a dragon, is only an emblematical figure, implying, that he conquered the devil by his faith and Christian fortitude. Several churches have been dedicated to this saint; the noble order of the Garter was founded in honour of him, and the 23d of April is still observed in commemoration of his martyrdom.

E

dom, his blameless life and unmerited death having secured to him a glorious name.

"Glory by few is rightly understood,
"What's truly glorious must be greatly good."

COOKE.

S E C T. XIII. CARAMANIA.

CARAMANIA extends itself along the Mediterranean coast from north to south, comprising the ancient Lycia, Pamphilia, Pisidia, Lycaonia, and Cilicia, with part of Iffauria, Phrygia, Pacajiana, Galitia, Salutarja, and Cappadocia. It reaches from the neighbourhood of Alexandretta to the gulph of Macri, at the mouth of which lies the island of Rhodes.

This country by the Turks is called Caraman-ly, and is divided into the Greater and Lesser; the latter lying along the sea-coast, and the former to the north of mount Tauris. It is governed by a beglerbeg, whose revenue is exceedingly large, and subordinate to whom are seven sangiacs, with many zaims and timars. The principal places are,

Myra or Myrra, which the Turks call Strumita, was once a considerable city, but is now dwindled almost to nothing; it is about 22 miles north east of Patara, situated near the mouth of the Limyrus.

Patara was once the metropolis of Lycia, but is now a very inconsiderable village near the mouth of the Xanthus, between the gulphs of Macri and Satalia.

Satalia, the ancient Attalia, is called by the Turks Sataliah. It was formerly an important city in Pamphylia, at the bottom of the gulph of its name, in 36 deg. 45 min. north lat. and 31 deg. 20 min. east long. It is the strongest place the Turks have upon this coast. The harbour would be commodious, if the entrance was not difficult and dangerous. It is one of the most singular places in the universe, being divided into three distinct towns, each of which is divided from the others by its own strong walls, and the gates are shut up precisely at noon every Friday till one o'clock, from a pretended prophecy, that on such an hour the Christians are to surprise it. The whole is about six miles in circumference; the buildings are good, the place populous, and the trade considerable. The summers are so hot, that those who can afford it retire towards the mountains, where there is more air and shade. The castle, which commands the town, is a very good one. The Christians had formerly a fine church in one of the towns, but it is at present converted into a Turkish mosque. The neighbouring country is very fertile and delightful, being covered with citron and orange groves, which afford an exquisite fragrance.

Sagalassus, though anciently a tolerable town, does not at present merit the name of a village. The same may be said of Antiochia Pisidia, or Cæsarea, which stands at the foot of mount Tauris, and was once the metropolis of the province. Such are the vicissitudes of sublunary things!

"Short is th' uncertain reign and pomp of mortal pride,

"New turns and changes every day

"Are of inconstant chance the constant arts;

"Soon the giv'ns, soon takes away;

"She comes, embraces, nauseates you, and parts."

HOWARD.

Iconium, now Cogni or Kogni, is the metropolis of the beglerbegate. It stands in the ancient Lycaonia, in a fertile pleasant plain, near a fine large lake of fresh water, which was anciently called Palus Trogilii. It is about 110 miles from the Mediterranean sea. It is surrounded by strong walls, adorned with towers, and a broad ditch. The Turks only inhabit the city. The Greeks, Armenians and Jews inhabit the suburbs, which are spacious. The city is commanded by a small castle, and adorned with several mosques, a seraglio, and some spacious caravanserais, for the accommodation of the

caravans and travellers which pass through the town. The mutton here is exquisite, the wool of the sheep admirable, and their tails so large, that sledges are fastened to the animal, upon which they are drawn.

Tarsus, the birth-place of the great apostle St. Paul, was anciently the capital of Cilicia, and one of the finest towns of the Lesser Asia, but at present is quite decayed. It is situated upon the Cydnus, about six miles from its mouth. The Turks call this town Tarsou, Tarsifu and Hom. If we may venture to judge by the ruins of the old wall, it appears to have been near 12 miles in circumference. At the mouth of the river there is a good commodious harbour, and about a mile below the town there is the lake Rhegma, through which the Cydnus runs.

Avana is a considerable town on the river Choquen, to the eastward of Tarsus, about 35 miles on the road to Aleppo, and about 18 miles from the Mediterranean. This town contains a great number of beautiful fountains supplied with water by aqueducts, and over the river there is a superb bridge of 15 arches. The adjacent country is exceedingly pleasant, and the soil extremely fertile.

Ajazzo, or Lajazzo, which was formerly called Issus, is situated on a gulph of the Mediterranean, to which it gives name. It was anciently a place of very great importance, and is at present a neat, strong, opulent sea-port town.

The following cities and towns, which were known to the ancients, but of which the moderns have but very imperfect accounts, are now so reduced to poor, mean, little hamlets, or so totally ruined and deserted, as not to merit any particular description, viz. Azar, Ainzarba, Telenculus, Xanthus, Phelcis, Pignara, Olbia, Magydis, Side, Perga, Sitnum, Arpendus, Termessus, Olbaza, Lystra, &c. &c. &c.

The principal rivers in Caramania are the Xanthus, Lamus, Cestrus, Eurymedon, Cydnus, Sarus, or Smarus, Pyramus, Limyras, Latamao, &c. Caramania contains many celebrated mountains, most of which are branches of mount Tauris or Taurus, viz. Olympus, there being many mountains in Asia of this name; Cragus, the etymon of which Bochart derives from the Arabic word Crac, which signifies a rock; from whence it is probable the English word Crag originated; and Antigragus, all in Lycia. In Cilicia the most remarkable is Amanus. The great chain called mount Tauris begins in Lycia, and runs eastward. But we must not omit to mention the celebrated Lycian volcano mountain, called by the ancients Chimæra. Its bottom was infested with serpents, the middle parts afforded pasture for goats, and the top was haunted by lions. This gave the idea to the poets to feign the monster Chimæra, which was represented with the head of a lion belching fire, a goat's body, and a serpent's tail. Mr. Pope, in his translation of Homer, has, however, changed the serpent's tail to a dragon's tail.

"A mangled monster of a mortal kind,

"Behind a dragon's fiery tail was spread;

"A goat's rough body bore a lion's head,

"Her pitchy nostrils flaky flames expire,

"Her gaping throat emits infernal fire."

Hence incongruous ideas are called chimæras, and inconsistent stratagems are said to be chimerical.

Bellerophon, being the first who planted this mountain, is honoured with the reputation of having subdued the monster.

The Lycians built the city of Hephæstia, near this mountain, in honour to Vulcan, on account of its volcano, which is mentioned by Virgil in the 6th book of his Æneid:

"Before the passage horrid Hydra stands,

"And Briareus with all his hundred hands;

"Gorgens, Geryon with his triple frame,

"And vain Chimæra vomits empty flame."

S E C T.

S E C T. XIV.

S Y R I A.

The general Description of Syria, Divisions, Subdivisions, Situation, Extent, Climate, Soil, Fertility, Produce, of the Inhabitants, &c.

SYRIA, or, as the Turks call it, Sourie and Souristan, was originally so called from its capital, Tzor or Tzur, which the Greeks softened into Sur and Tyre. This country, in the most extensive sense, includes Syria properly so called, Phenicia or Phenice, and Judea or Palestine. It extends from north to south about 400 miles, and about 200 from east to west, being bounded on the north by mount Amanus, and a branch of mount Taurus, which separates it from Armenia Minor and Cilicia; on the east by the Euphrates, which divides it from Mesopotamia or Diarbec, and on the west by Arabia the Desert.

The principal mountains are Libanus, Anti-Libanus, Gilead, Tabor, Carmel, Cassius, Amanus and Aladaurus, with some smaller in Judea, viz. Sion, Hermon, Ebal, Olivet, Calvary, Gerizzim, and Moriah.

Of these mounts, the Libanus, and Anti-Libanus, which are situated in Coelo-Syria, are of an astonishing height and extent.

"His proud head the airy mountain hides
"Among the clouds, his shoulders and his sides,
"A shady mantle cloaths, his curling brows
"Turn on the gentle stream, which calmly flows,
"While winds and storms his lofty forehead beat,
"The common fate of all that's high and great."

These mountains were formerly celebrated for their lofty cedars, which at present are reduced to a very small number; they are green all the year, and bear leaves resembling those of the juniper-tree, the smell of which is delightfully fragrant. The smaller species bear a kind of apple, as large as a pine-apple, but smoother, and of a browner colour; they contain a transparent balm which falls from them by drops at certain seasons. These apples always grow in clusters at the extremity of the branches. The incorruptibility of the cedar tree is owing to the bitterness of the wood, which is so great that no worm will harbour in it.

The highest parts of these mountains, and those of Amanus, are covered with snow the greatest part of the year; and in some hollow places, whither the sun beams cannot penetrate, it remains undissolved the whole year. Many of the cavities abound with petrifications which are exceedingly curious.

The rivers are the Euphrates, Jordan, Cassimeer, Licomes, Chryssorroas, Orontes, Odonis, Cherseus, with others less considerable, particularly the Coik, or river of Aleppo.

The Jordan receives its name from the brooks Jor and Dan, which form it by uniting their streams. It formerly overflowed its banks, as both sacred and profane writers inform us; it does not, however, do so at present, but flows with great regularity.

Syria is blessed with the most serene, temperate, and healthful air imaginable; during the hot months of June, July, and August, it is agreeably refreshed by cooling breezes from the Mediterranean. The face of the country is delightful and level, the soil rich and fertile. It abounds not only with all the necessaries of life, but with all the delicacies which can gratify the most luxurious appetite; and is superior in point of climate and produce, to all other countries that even lie under the same parallel of latitude.

"Here summer reigns with one eternal smile,
"Succeeding harvests blest the happy soil;
"Fair fertile fields, to whom indulgent heav'n,
"Has ev'ry charm of ev'ry season giv'n;
"No killing cold deforms the beauteous year,
"The springing flowers no coming winter fear;

"But, as the parent rose, decays, and dies;
"The infant buds with brighter colours rise,
"And with fresh sweets, the mother's scent supplies;
"Near them the violet grows with odours blest,
"And blooms in more than Tyrian purple dress.
"The rich jonquils their golden beams display,
"And shine in glories emulating day:
"The peaceful groves their verdant leaves retain,
"The streams still murmur, undel'd by rain,
"And tow'ring greens adorn the fruitful plain:
"The warbling kind uninterrupted sing,
"Warm'd with enjoyment of perpetual spring."

Lady M. W. MONTAGUE.

This charming country produces spontaneously a superabundance of all that is necessary for the profit or delight of man, for the indolent Turks are too lazy to cultivate it. The only people who take the least pains with the soil are the Armenians and Franks, who are settled in the country. From what has been said, it may naturally be inferred, that the inhabitants are plentifully supplied with corn, wine, oil, figs, lemons, oranges, melons, canes, dates, cotton, honey, aromatic and medicinal herbs, &c. they likewise breed great numbers of buffaloes and other oxen, camels, dromedaries, swine, deer of all sorts, hares, rabbits, and other game. They have a breed of goats whose hair is long and of a colour exceedingly beautiful. The sheep are some of the best in the universe; their wool is exceedingly fine, and their tails so large that to prevent their receiving any injury from trampling in the dirt, they are placed upon sledges, as in some other parts of Asia. Besides a variety of excellent fish, this country abounds in wild fowl, such as partridges, quails, pheasants, pigeons, turtle-doves, &c. The plains are so tender, fat and humid, that the soil is turned up with wooden coulter. In short, though Syria contains some rocky mountains, it would be the finest and most desirable country in the universe, was it not under such a despotic government; but the Turkish tyranny is such that it prevents the inhabitants from ever tasting the sweets of that most essential necessary to human happiness, viz. LIBERTY.

"O Liberty, thou goddess, heav'nly bright,
"Profuse of bliss, and pregnant with delight,
"Eternal pleasures in thy presence reign,
"And smiling plenty leads thy wanton train;
"Eas'd of her load, subjection grows more light,
"And poverty looks cheerful in thy sight;
"Thou mak'st the gloomy face of Nature gay,
"Giv'st beauty to the sun, and splendour to the day."

ADDISON.

Besides Mahometans and Jews, many Christians of different sects inhabit Syria, viz. Greeks, Latins, Armenians, Malchites, Maronites, and Jacobites.

The Armenians differ but little from the Greeks, and have a patriarch, whose place of residence is Damascus. The Maronites of Mount Libanus hold some of the Greek, and some of Eutylian tenets. They give the sacrament in both kinds, and use the Syriac liturgy. Their patriarch is always styled Peter, and looked upon as the only true successor of that apostle. The Jacobites, who are so called from their founder Jacobus Syrius, have a patriarch, who is always named Ignatius, and deemed the real successor of that celebrated father and martyr. The Drusians, who live among the mountains, know little of christianity besides the name. They in a great measure resemble the Curds who reside among the Armenian mountains, and pay a much greater respect to the devil than to God, for which they assign this curious reason; that God is so very good humoured at all times, that he will not do them any injury, let them be ever so neglectful and remiss in their duty; but on the contrary, the devil has frequently such mischievous fits, and is naturally inclined to such diabolical frolics, that the utmost precaution is necessary to keep his infernal highness in any tolerable temper.

The Jews are here the principal brokers in the mercantile,

cantile, and their wives the chief agents in the intriguing way; for under the pretence of vending jewels, laces, perfumes, cosmetics, &c. they get admittance not only into the houses, but the harems of the Turks, and can slip a billet-doux, eluding at the same time the penetrating eye of Asiatic suspicion, with as much dexterity as a Neapolitan valet can deceive a jealous Italian husband.

The language spoken by the Syrians is a corrupt kind of Arabic or Moreco. But most of the inhabitants of the trading and maritime towns use the *Lingua Fœnœa*.

Each of the grand divisions of Syria, viz. Syria Proper, Phœnicia and Palestine, is governed by a beglerbeg, subordinate to whom are many sangiacs, zaims, timars, cadics, &c.

SECT. XV.

SYRIA PROPER.

SYRIA Proper is bounded on the south by the Deserts of Arabia and Phœnicia; on the north by Armenia Minor; on the east by Mesopotamia, and on the west by the Mediterranean. Syria Proper had anciently three subdivisions, viz. Cœlo-Syria, or Syria the Hollow, Syria-Antiochene or Seleucia, and Syria Comagene.

The principal places in that subdivision, called Comagene, are,

Samofata, which the Turks now call Scempfal, and was once the capital of Comagene, but at present is only a wretched village, surrounded by heaps of ruins. It stands on the Euphrates, on the confines of Armenia Major, 22 miles from Ediffa. The celebrated satirical poet Lucian was born here.

Dolicea, called by the Turks Doliche, once an episcopal see, but at present a mean ill built town, thinly peopled, and of little consideration. It is situated on the river Marfyas, which disimbogues itself into the Euphrates.

Nothing now remain but the names, and a little rubbish of the ancient cities, Germanicia, Singia, Antiochia-ad-Taurum, Caramana, Deba, Chœmia and Chelinadura.

In that subdivision of Syria called Seleucia or Antiochene, which is bounded on the north by Comagene, on the south by Cœlo Syria and Phœnicia, on the west by the Mediterranean, and on the east by Mesopotamia, the principal places are,

Scanderoon, which was anciently called Alexandretta, or Little Alexandria, to distinguish it from Alexandria in Egypt, lies in 36 deg. 34 min. north lat. and 36 deg. 40 min. east long. at about the distance of 60 miles to the westward of Aleppo, to which it is the port town; it stands near the sea on the gulph of Ajazzo: but its marshy situation renders the town so unhealthy, that it only contains at present a confused and straggling heap of mean wretched houses, built of wood or huts formed of the boughs of trees, interwoven and covered with mud, inhabited principally by Greeks, who accommodate common travellers and sailors that resort hither; as people of a superior rank usually lodge with the consuls of their respective nations, who have handsome houses at a considerable distance from the town. During the hot months the natives themselves retire to a village called Beylin, which is situated on a high hill, at about two leagues distance; and abounds in excellent water, and admirable fruits. If strangers happen to arrive during this sultry season, they seldom escape with their lives. The above-mentioned mountain yields a thoroughfare to the N. E. wind by means of an opening; and whenever it blows hard, the ships in the harbour all put to sea with the utmost expedition, to avoid being dashed to pieces. Some assert that this city was built by Alexander the Great, in commemoration of a victory obtained over Darius, in its vicinity. It is defended only by an old decayed castle, and a few soldiers, under the command of the governor; but we must not omit to mention this singular circumstance; that the correspondence between Scanderoon and Aleppo, is carried on by the means of pigeons, that are taught to fly backwards and

forwards with letters about their necks. Some late travellers, however, say that this custom is discontinued. The adjacent country is in general level, rich, and fertile.

About 22 miles from Scanderoon, is the ancient city of Antioch, or at least its remains. It was formerly the capital of all Syria, and one of the noblest metropolitan cities in the universe; but is at present reduced to a poor mean hamlet, containing only a few scattered houses: it is situated in a fine plain of 18 miles in extent, on the river Hasi, or Orante; the Turks call it Antackia. The vast number of plantain, poplars, sycamores, fruit-trees, &c. in the gardens of the town, make it at a distance look like a forest. It has a castle which commands the town and river, and some considerable remains of ancient temples, walls, churches, &c. together with an extensive canal. The disciples of Christ first obtained the name of Christians in this city. Saint Paul and Saint Barnabas preached a twelvemonth in this place; Saint Luke the Evangelist, and Saint Ignatius the martyr, were born here. Seleucia, or Seleucia Piera, which latter denomination was given to distinguish it from another town of the same name on the Tigris, was anciently a considerable sea-port town: at present it is but a trifling village, situated on the Mediterranean, at the mouth of the Orontes, about 60 miles from Scanderoon. The Franks call it the port of Saint Simeon; but its Turkish name is Seluki-Jelber.

Tertafu, which was formerly called Orthofia and Antaiabus, from its being situated over against the little isle of Aradus, was once a famed sea-port, and an episcopal see; at present it is a very inconsiderable place, and inhabited only by poor fishermen. It is about nine miles to the northward of Tripoli.

Latakia, or Ladhikiya, the ancient Laodicea, was founded by Seleucus Nicanor, or the Victorious, and called by him after his sister's name. It is the most northern city of Syria, situated upon a rising ground, with a full prospect of the sea, in 35 deg. 30 min. north latitude. It is a considerable maritime town.

This city contains many antique remains, particularly several rows of columns of granite and porphyry, with part of an aqueduct, which Josephus affirms was built by king Herod. The structure is spacious, but not arched. Here is a mosque formed of a magnificent ancient triumphal arch, supported by Corinthian pillars; the architrave is embellished with a variety of warlike trophies. Many Greek and Latin inscriptions are found among the ruins, but they are in general so much decayed as to be unintelligible. To the westward of the city are the remains of a cotton, big enough to hold the largest navy in the universe. The mouth, which is about 40 feet wide, is defended by a castle; and the whole is in an amphitheatrical form: it is so choaked up at present, as to admit only a few small vessels.

The remarkable catacombs which are a little to the northward of the city, excite the attention of travellers. They contain large stone coffins, embellished with emblematic figures, shells, &c. The covers of some are supported by pillars, generally of the Corinthian, but sometimes of the Ionic order: these coffins are deposited in cells on the sides of a number of chambers hollowed deep into the rock, being each from 10 to 30 feet square. The most respected of these sepulchral chambers is that called St. Teckla, which is dedicated to that first virgin martyr: in the midst of it is a spring, to which many miraculous effects are ascribed.

The whole of the adjacent country is extremely romantic, from the intermixture of rocks, woods, sepulchres, plains, grottos, fountains, cascades, &c. A few miles from a place called the Serpent Fountain, are the spindles, or magazzels, a name which is given to several painted cylindrical buildings, that are erected over a number of sepulchres.

The ruins of the ancient city of Arka, are delightfully situated opposite the northern extremity of mount Libanus; to the eastward a romantic chain of mountains appear; a fine extensive plain, interspersed with castles, villages, ponds, rivers, &c. opens to the north, and the sea is lost to the west. The city was erected on the summit of a hill of a conical form,

which appear to have been a work of art; a fine stream waters the valley below the city; nevertheless the inhabitants were supplied with water from mount Libanus, by means of a magnificent aqueduct.

S E C T. XVI.

COELO-SYRIA.

THE principal places in this division of Syria are, Apamea, founded by Seleucus Nicanor, and so named in honour of his mother, as Antioch was after his father, Laodicea after his sister, and Seleucia from himself. It is greatly fallen from its former splendour, but still remains a considerable town, standing on a spot of ground which is almost surrounded by a lake formed by the river Orontes, about 60 miles to the southward of Aleppo; so that it hath no communication with the land but by an isthmus, or small neck. The Turks and Greeks call it Hama: it is the residence of a beglerbeg, whose government is very extensive; the adjacent territory is exceedingly rich and fertile; the city is well watered, retains many marks of its ancient magnificence, and was very early an episcopal see. It lies in 35 degrees 6 min. north latitude, and 37 deg. 18 min. east longitude. Near this city, Seleucus constantly fed 500 large elephants.

Between Antioch and Tortosa, near mount Lifa, there is a little mean village called Margar, which was antiently a considerable place, named Marathos.

Emela, Emilla, or Emila, is situated between Apamea and Laodicea, on the river Orontes. The mad emperor Heliogabalus was born there, and on that account took the whim into his head to be made one of the priests of its temple; the Turks at present call it Haman, or Aman. It is under the jurisdiction of the beglerbeg of Damascus, who governs it by means of a deputy. It still makes a considerable figure, notwithstanding what it has suffered by earthquakes, and the various changes it has undergone. It is surrounded by good stone walls, with six superb gates, and several magnificent towers at proper distances. The walls are encircled by a spacious ditch; and on an eminence there is a castle which commands and defends the town. Here are some fine churches, the greatest part of which are converted into mosques. The cathedral is a magnificent structure, supported by 34 marble columns, adorned with basso-reliefs and Greek inscriptions. The Christians are permitted to pray in it at certain times, besides which they have some churches appropriated entirely to their own use. The bazars, kans, caravaneras, &c. are in general very handsome structures; the inhabitants trade in silks, and a fine kind of needle-work of silk, gold, and silver, curiously intermingled together: the adjacent country is very rich and fertile, and the gardens in the environs exceedingly delightful, abounding in a great variety of excellent plants, and delicious fruits. In all the gardens innumerable mulberry trees are planted in regular rows, and well watered, as the demand for mulberry leaves to feed their silk worms is very great.

Aleppo, the finest and most opulent city in all Syria, lies in 36 deg. 30 min. north lat. and 37 deg. 30 min. east long. about 60 miles to the eastward of Scanderoon. It is built on eight eminences or hills, one of which in the center of the city is higher than the rest, and on its top there is a strong castle.

Aleppo, including the suburbs, is about seven miles in circumference; in extent, riches, and population, it is inferior to Constantinople and Grand Cairo, but exceeds them both in the elegance of its buildings; the surrounding wall is old and decayed, and the ditch converted into gardens.

When fortresses are suffer'd to decay,
It shows that peace and commerce bear the sway;
That merchants of stern officers are made,
And blood alone is the neglected trade.

The houses are of stone, built in a quadrangular form, consisting of a ground floor and an attic story: the roofs are flat, and either spread with plaster or paved with stone: the ceilings, pannels, doors, windows, &c.

are neatly gilded and painted, and adorned with inscriptions from the Koran, or the best Asiatic poets; so that their very embellishments are subservient to the purposes of morality, and their chambers are rendered tacit advisers to prudence and precaution. Of these inscriptions the following specimens may be entertaining to the reader.

The Mahometans are exceedingly fond of the two following passages from the Koran or Alcoran, which are therefore frequently found about their rooms written in letters of gold.

The first, which is deemed one of the best adages in the Koran is, "Forgive easily, do good to all, and dispute not with the ignorant." The other, which relates to the Almighty's stopping the deluge is, "Earth swallow down thy waters, thy drink up those thou hast poured forth. The waters were immediately gone, the commands of God were executed. The ark rested on the mountain, and these words were heard, 'Wee to the wicked.'"

An Arabian poetical paraphrase of that passage in the Koran, which relates to the angel Gabriel's conducting Mahomet to see Paradise, is greatly admired. Take an English translation of the verses.

From heaven descending thro' ethereal flame,
On earth again the mighty prophet came;
To Paradise by faithful Gabriel led,
While streams of glory hover'd round his head:
He saw, the soil like purpl'd silver bright,
The lofty mountains shone with splendid light,
The spacious walks with dazzling lustre glow'd
By diamonds gravel'd, and with brilliant strew'd;
The lesser hills like yellow amber seem,
While silver waves thro' fertile meadows stream;
The lofty concave is th' Almighty's throne,
Who makes his mercies to the righteous known:
Angels and prophets occupy the place,
And dwell in mansions of celestial grace;
Streets pav'd with gold, with lamps ethereal shine,
Rich gems adorn the palaces divine;
Fair sapphire gates which none but saints can scale,
Lead to the jasper-green-bespangl'd vale,
Where aromatic herbs that ever bloom,
Refresh the spirits, and the air perfume.
Here wine and milk in streams meand'ring glide,
So rich the waves, so delicate the tide;
There crystal springs make agate fountains gay,
Where gold and silver sportive fishes play.
Delicious fruits on every tree abound,
And load the branches till they kiss the ground;
Here craggy rocks diversify the scene,
Whole rows are fleecy, and whose feet are green:
But by these rocks no barrenness betray'd,
For there sweet honey by the bee is made;
Honey that's blest'd with captivating powers,
Drawn from celestial aromatic flows,
All is enchanting which the place contains;
For here the essence of all goodness reigns.

Such is the romantic and whimsical paradise of Mahomet, in which spiritual and sensual ideas are so blended and jumbled together, that it seems equally calculated to debauch the faint, and entice the sinner. The images, however, shew the richness of the Asiatic fancy; we therefore hope that the translation, as it is the first thing of the kind that ever appeared in our language, will not be unacceptable to the public.

We shall add the following fix inscriptions, as they are concise and significant:

"Four things should never flatter us: the familiarity
"of princes; the caresses of women; the smiles of our
"enemies; nor a warm day in winter; for none of
"these are of long duration."

"One pound of food is sufficient in one day to support
you; if you eat more, it is a load, and you must
support in your turn that."

"We are the bow, and shoot but in the dark;

"'Tis God directs the arrow to its mark."

F f

H e

"He that thinks to content his desires by the possession of what he wishes for, is like him who puts out fire with straw."

To obtain knowledge you must have

"The vigilance of a crow, the greediness of a hog.
"The carelessness of a cat, and the patience of a dog."

"I have cleaned my mirror, and fixing my eyes on it,
"I perceived for many defects in myself, that I easily forgot those of others."

But to turn to our description of Aleppo; the streets have a dull appearance on account of being shielded from the view by dead walls. If palliades were used instead of walls, it would render the streets admirably pleasant, as the court yards are all prettily paved, and have a fountain in the center environed with a little verdure.

The best houses have usually on the ground floor a hall covered with a dome, with a fountain in the middle to cool it. Among the numerous mosques of this city, some are very magnificent and agreeable. There is a fountain of ablution, and sometimes a little garden in the area of each. In every garden you are sure to find cypresses. The kans are spacious and elegant, but the shops are small; the buyer stands always without, none being admitted within a shop but the master and his clerk. They usually shut them about an hour and halt after sun-set. There is a great singularity to be observed in the houses of Aleppo; the doors are strongly cased with iron, but the locks are only slightly made of wood.

The streets, though narrow, are extremely clean, and always well paved: all offensive manufactures and disagreeable trades are confined to the suburbs; in which, among others, there is a glass manufactory.

Every house has a well, but the waters being brackish are not used in dressing provisions or to drink; the water for these purposes being brought from some fine springs by means of an aqueduct, and properly distributed by communicating pipes.

The house fuel is wood and charcoal, but the bagnios are heated with dung, the parings of fruit, &c. the gathering of which gives employment to many poor people.

Aleppo is situated in a vast plain; the environs of the city is stony and uneven; but at a few miles distant the circumjacent country is level and fertile; nevertheless, the whole has the name of the desert. The western part of the city is washed by a stream called Coic, which, with the wells in the city, and the water brought by the aqueduct, is all the water that is to be found for the space of 30 miles round. The neighbouring villages having no water but rain water, which they save in large cisterns.

The air is so pure and free from damps that the inhabitants sleep on the house-tops without the least inconvenience. The only winter is from December 12, to January 20; but even then the sun has great power in the middle of the day. The snow never lays more than a day upon the ground, and the ice is seldom or ever strong enough to bear the weight of a man. From May to the middle of December the air is excessive hot; but the most malignant heat continues only about five days, during which the inhabitants keep within doors as much as possible, and defend themselves from the pernicious winds by shutting close their windows and doors. The harvest commences in the beginning of May, and usually lasts about twenty days; the horses are fed with barley, as oats do not grow nearer than Antioch. Near the city, but more particularly in the neighbouring country, from Shogre to Letachia are a great number of tobacco plantations, a considerable trade being carried on in that article with Egypt. The adjacent country yields a few olives, red and white grapes, and several kinds of fruit, which are but indifferent; at some distance from the city a species of fuller's earth is found, which is an excellent substitute for soap. Black cattle are scarce, the larger sort are kept for labour, the smaller have short horns, and the buffaloes are valued on account of their milk: it is to be observed that the Turks and Jews seldom or ever eat beef, their favourite food being mut-

ton, of which they have plenty at Aleppo. There are two sorts of sheep, the one much like the English sheep, and the other of the species with large tails, which they drag after them on fleeces, as already mentioned. The goats have long ears, and give excellent milk, which is sold about the streets from April to September.

The butter and cheese is made either from the milk of cows, buffaloes, sheep or goats. The people are very fond of leban or coagulated milk. Here are plenty of hares and antelopes; the latter are of two sorts, viz. The antelope of the mountain, and the antelope of the plain. The former is the most beautiful, the back and neck being of a dark brown; the latter, though its colour is brighter, is neither so swift nor so well made. Tame rabbits are kept in the city, and some few wild stags are found in the country, as well as porcupines: the Franks of the Romish persuasion often eat land turtles and frogs. The camels of this country are good and serviceable, but the horses are very indifferent; hyenas are found among the rocks, they seldom attack the human race, but commit great ravages among the flocks, and even plunder the sepulchres. In the city of Aleppo are a vast number of dogs; and the environs are infested with wolves; serpents are innumerable, particularly a white snake, which is found in houses, but whose bite is not venomous. The scorpions and scorpion often sting the natives, but a few hours pain is the only consequence. Besides the above, here are locusts, lizards, bees, silk-worms, all kinds of fowls, &c.

Hawking and hunting are favourite amusements; the sportsmen have a very beautiful species of the greyhound; shooting is exercised only for a subsistence.

Aleppo, by computation, is inhabited by 200,000 Turks, 30,000 Christians, and 5000 Jews. The Christians are Greeks, Armenians, Syrians and Maronites. They have each a church in the suburb Judida, where they all reside; the common language is vulgar Arabic: the better sort of Turks speak the Turkish; the Jews, Hebrew; the Armenians their native tongue, and some of the Syrians understand the Syriac; but the Greeks know little or nothing of either the ancient or modern Greek language.

In general, the people are well made, of a middle stature, inclining to lean, but inactive and languid: the citizens are usually fair, but the peasants, who are exposed to the sun, swarthy; both have black hair and black eyes: they are tolerably handsome when young, but seem to appear old by thirty. The females marry about the age of fourteen. It is very singular that the men gird themselves very tight about the waist in order to make themselves look slender, and the women do all they can to render themselves plump, as they deem a slender waist a great deformity.

The people in general are polite, but guilty of dissimulation, and affectedly grave. They often quarrel, but never fight: the coffee-houses are frequented only by the vulgar. The amusements within doors are chess, back-gammon, drafts, and the game of the ring, which only consists of guessing under what coffee cup the ring is put; the winner blacks the face of the loser, and puts a fool's cap on his head. Though Christians are fond of playing for money, the Turks only play for amusement, or sometimes for a feast to entertain their friends. Dancing is despised, and only practised by buffoons, who, as well as wrestlers, are attendants at all entertainments.

The common bread is made of wheat badly fermented and badly baked. People of fashion have, however, a better sort. Besides these, they have biscuits and rusks strewed with fennel flower.

Those who pay visits are entertained with a pipe of tobacco, wet sweetmeats and coffee, without sugar or milk. When particular respect is intended, sherbet and a sprinkling of rose-water are added. But as soon as the host begins to wish his visitor gone, the wood of aloes is produced, which implies, that the visit has been sufficiently long. Men and women here smoke to excess. The tube of the pipe is made of the wood of the rose-tree, but the bowl is of clay. Opium is in little esteem at Aleppo, and those who take it to excess are looked upon as debauchees. Here are no coaches, the better sort

sort of people ride on horseback, with a number of servants on foot parading before them. Women of rank are carried in litters, and the lower class in covered cradles or mules.

They go to bed early, and sleep in the principal part of their cloaths. Their bed consists of a mattress, and over it a sheet, in summer; and a carpet, with a sheet sewed to it in winter. The men are either lulled to rest by music, smoke themselves to sleep, or are talked to sleep by their women, who are taught to tell innumerable stories for that purpose. The people in general are grossly ignorant, few even of the better sort can read. The clergy are not only divines, but lawyers and physicians. They have many colleges, but little or nothing is taught in them. The government permits not the practice of anatomy: their physicians and surgeons therefore can know but little of the structure of the human body.

The old men colour their beards black to conceal their age, and the old women dye their hair red with Henna to render it graceful. They likewise dye their hands and feet with the forms of roses and other flowers, which to a European appears very disagreeable. The women in the villages, and all the Chinganas and Arabs, wear gold or silver rings through their right nostrils. The Turks breakfast on honey, Leban cheese, fried eggs, &c. They dine about eleven o'clock. They use a table here, which is round as well as the dishes; both are made either of copper tinned, or silver. The table is placed upon a stool about fourteen inches high, beneath which a piece of red cloth is spread to prevent the divan from being spoiled. There is no table-cloth, but their knees are covered with long silk napkins. The dishes are placed in the middle of the table, being brought in one by one, and changed as soon as every one has tasted a little. The Leban in bafons; bread, fallads, pickles, spoons, &c. are disposed in order round the edges. The spoons are made of wood, horn, tortoise-shell, &c. They use neither knives nor forks. The first dish is broth, and the last pilaw. The intermediate dishes are mutton roasted and stewed with herbs, and cut to pieces; stewed pigeons, fowls, &c. stuffed with rice and spices; but the most favourite dish is a whole lamb stuffed with rice, almonds, raisins, pistachios, &c. They have likewise a desert of sweet starch, and a thin syrup with it, with currants, raisins, dried apricots, slices of pears, pistachios, apples, &c. swimming in it, of which each eats a spoonful, and then the repast is concluded.

They drink water at meals, and coffee after dinner; sup about five in the winter, and six in the summer. The licentious drink wine and spirits publicly, but the hypocritical part of the people in private; and when they once begin, they generally drink to excess.

They have a few black slaves in Aleppo, which are brought from Ethiopia by the way of Cairo, but the slaves in general are white, being Georgians. Criminals are here hanged, impaled, or beheaded, at the option of the judge; but janissaries are strangled by a cord twisted twice round the neck, and drawn tight with a piece of stick.

The Christians of Aleppo eat much in the same manner as the Turks, only the latter use oil, and the former butter.

There is but little difference in the customs and ceremonies of the Greek, Syrian, Armenian, and Maronite Christians. A Maronite nuptial ceremony is thus conducted: The bridegroom's relations are invited to the house of the bride to an entertainment: after supper they return to the bridegroom's house, who hitherto has not appeared; for he is obliged to hide himself, and not to be found without a pretended search. At length he is brought out in his worst cloaths, but soon after the bridemen conduct him to a chamber, which contains the wedding garments, where he is left to dress himself.

About midnight the company, preceded by a band of music, and each carrying a lighted candle, go to the bride's house and demand her. Admittance is refused. A mock fight ensues. The bride is taken prisoner, and being closely veiled, is conducted to the bridegroom's house. The night is spent in feasting and mirth, but the bride must not speak the whole time. The bishop or priest comes the next morning to perform the ceremony,

in which he puts crowns on the heads, and joins the hands of the bride and bridegroom, who each have a ring to put on the finger. A few ridiculous, uninteresting and riotous ceremonies ensue, and the bridegroom is not left to himself till twelve o'clock at night, when he is permitted to retire to the bride.

All the bride's female acquaintance send flowers to her as presents for some days after her marriage, but she is not allowed to speak for the space of a month, even to her husband.

The Franks here are principally French and English. The English have a consul, chaplain, chancellor, and chiau. The French have their consul, drugmen, and other officers, and are more numerous than the English. No Dutchman resides here except the consul. A few Venetian merchants and Italian Jews are, however, settled in the place. The plague is the most dreaded thing at Aleppo; it begins to rage in June, and decreases in July; and usually visits the inhabitants every ten years, when it commits vast devastations. To avoid the infection, the following circumstances are to be observed. Never go abroad fasting; drink plentifully of acids, live regularly, but not abstemiously; avoid excess and passion; breathe through a handkerchief or sponge wetted with vinegar, or an infusion of rue; swallow not the spittle; wash your mouth, face, and hands, often with vinegar; air your cloaths well, change them often, and smock them with sulphur.

S E C T XVII.

Phœnicia, or Phenice.

THIS division of Syria, taken in its largest extent, is bounded by the Mediterranean on the west; by Cœlo-Syria and Batanea on the east; by Palestine on the south; and Syria-Propria on the north.

In ancient times this country made a very considerable figure in history, on account of the ingenuity of its inhabitants, its manufactures, commerce, colonies, &c. To the Phœnicians are attributed the invention of letters, the art of navigation, glass-making, &c.

This country is a narrow strip of land running along the sea coast from north to south; anciently it was divided into Syro-Phœnicia and Maritime-Phœnicia, and contained many fine cities and sea-ports. In the sacred writings it is distinguished by the name of Canaan. The principal places are,

Tripoli, or Tripoli of Syria, so called to distinguish it from other places of the same name: it stands in the Levant Sea, in 34 deg. 30 min. north lat. and 36 deg. 15 min. east long. at the foot of mount Libanus. It had its name from forming three cities, each a stade's distance from the other; one of which belonged to the Aradians, another to the Sidonians, and a third to the Tyrians. All, however, are at present united, and it is still a flourishing city, being divided into what is called Upper and Lower Town. It is extensive, strong, populous, and opulent, adorned with fine gardens and orchards, plantations of mulberry trees, &c. The walls are strong, and fortified with seven towers. The castle is the residence of the pasha, and garrisoned by two hundred janissaries. It is a strong fortress, situated on an eminence, and well stored with cannon. On account of its importance it is deemed the metropolis of Phœnicia. The city is commodious, and watered by a little river. The harbour is very open, but it is rather defended by two small islands at about two leagues from it. There are six square towers or castles along the shore, well fortified with artillery. The town contains 8000 houses, and 60,000 inhabitants, who consist of Turks, Jews, or Christians. The river hath a good stone bridge over it, and turns several mills. The gardens have all cascades or fountains, and even the chambers have water conveyed to them. In the gardens the people spend most of their summer, being lulled in their silk-worm manufactory. The air is clear and healthy, the country rich and fertile, and the town plentifully supplied with all kinds of provisions. Here is a large handsome mosque, which was once a Christian church. The Jesuits have a handsome college, and the Christians in general some monasteries and chapels.

Botrys,

Botrys, or Botrus, was once a considerable place, but is now a poor village of fishermen, standing on the coast to the south of Tripoli, and called by the Turks Patron, or Elpatron.

Byblus, or Byblos, formerly a fine city, but now a mean village, denominated Gebail, is situated on the coast about 20 miles south of Tripoli. The river Adonis descending from mount Libanus runs through the town. This river is subject to swell to an immoderate degree by the melting of snow, or falling of rains, and at certain times the waters appear bloody, which the superstitious inhabitants used to impute to the death of Adonis, who is thus alluded to in Scripture, under the name of Tammuz, or Thammuz, Ezekiel viii. 14. "Then he brought me to the door of the gate of the Lord's house, which was toward the north, and behold there sat women weeping for Tammuz."

Milton, in his *Paradise Lost*, mentions the circumstance thus:

" — Thammuz came next behind,
" Whole annual wound in Lebanon allur'd;
" The Syrian damsels to lament his fate,
" In amorous ditties all the summer's day,
" While smooth Adonis from his native rock
" Ran purple to the sea, suppos'd with blood
" Of Thammuz yearly wounded. The love tale
" Infected Sion's daughters with like heat,
" Whole wanton passions in the sacred porch
" Ezekiel saw, when by the vision led,
" His eye survey'd the dark idolatries
" Of alienated Judah."

The natural cause of this pretended bloodiness, is only a kind of minium or red earth, which is brought away by the waters when they swell to an unusual height, and give the river a crimson tinge.

The poetical fable of Adonis is, that having neglected the good advice given him by Venus, relative to hunting, he was devoured by a wild boar, and afterwards transformed by that goddess into the flower called *anemone*. The story is thus told by Ovid:

" The trembling boy by flight his safety sought,
" And now recall'd the loss by Venus taught;
" But now too late to fly the boar he strove,
" Who in the grain his tusks impetuous drove.
" On the discoloured grass Adonis lay,
" The monster trampling o'er his beauteous prey;
" Fair Cytherea, Cyprus scarce in view,
" Heard from afar his groans, and own'd them true,
" And turn'd her snowy swans and backward flew.
" But as she saw him grasp his last breath,
" And quivering agonizing pangs of death,
" Down with swift flight she plung'd, nor rage forbore
" At once her garments, and her hair she tore;
" Nor shall they yet, she cried, the whole devour,
" With uncontroll'd, inexorable power.
" For thee, lost youth, my tears and restless pain,
" Shall in immortal monuments remain.
" With solemn pomp in annual rites return'd,
" Be thou forever, my Adonis, mourn'd.
" Then on the blood-sweet nectar she bestows,
" The scented blood in little bubbles rose;
" Little as rainy drops, which fluttering fly,
" Borne by the winds along a low'ring sky.
" Short time enur'd till where the blood was shed,
" A flower began to rear its purple head;
" Such as on Fumie apples is reveal'd,
" Or in the silvery rind but half conceal'd;
" Still here the fate of lovely forms we see,
" So sudden fades the sweetest bloom.
" The feeble stems to stormy blasts a prey,
" Their sickly beauties droop and pine away;
" The winds forbid the flowers to flourish long,
" Which owe to winds their names in Grecian song."

In this town there is a deputy governor, subordinate to the beylerbeg of Syria, and a small garrison; there is, however, but little trade, the harbour being almost choked up.

Berytus was once a flourishing city, but is now upon the decline; the streets are narrow, dirty, and dark. It is, however, a trading place, and a stage for the caravans that go to Grand Cairo. It is situated on the sea coast, in a country that is fertile and delightful, about forty miles from Tripoli. About the town some stately ruins are visible, particularly of the palace and gardens of Taccardine, the fourth emir or prince of the old Drufians; and of an old amphitheatre, supposed to have been built by Agrippa. The trade consists of fine tapestry, camblets, silks, cinnamon, nutmegs, ginger, cassia, pepper, rhubarb, cochineal, &c. Along the coast mulberry and other trees, gourds, colocynth, &c. abound.

Sarepta, Serphant, or Serphanda, a city anciently celebrated for the abode which the prophet Elias made in it with a poor widow, is at present but an indifferent village, about a mile from the sea, and situated on a hill.

Sidon, or Sayd, as the Turks call it, a city celebrated both in sacred and profane history, more particularly for its extensive trade, is now a small town, and contains about six thousand inhabitants. Here are many mosques, two kans, a public bagnio, and a fine square building, called the cotton market. The exports consist of Turkey leather, pistachios, fenna, buffaloes, skins, cotton, blue furs, rice, soap from Egypt, affies, oil, raisins, &c. There are the ruins of a fine port on the north side of the town. The city is governed by a bassia, and an aga, who has under his command about 300 soldiers, quartered in the castle and the town. The harbour is large, but not safe, on which account the ships ride at anchor about a mile from the town under a ridge of rocks. The gardens in the suburbs contain oves of mulberry, olive, tamarind, fycamore, and other trees. The French consul resides in a very pleasant house near the aforementioned rocks where the ships lie at anchor. The city, it is said, had its name from the eldest son of Canaan.

Tyre, Tyrus, or Sor, as it was anciently called, was situated upon a rock, which its name implies. It was usually named the Daughter of Sidon, being about two hundred furlongs distant from that city. Tyre had two havens, one towards Sidon, and the other towards Egypt, and was divided into three cities, viz. Pala-Tyre, that is, Tyre on the Continent, or Old Tyre; Tyre on the island; and Tyre on the Peninsula. The houses of the city were very lofty, which was owing to the scarcity of ground. The buildings in general were magnificent, particularly the superb temple erected by its king Hiram, and dedicated to Jupiter, Hercules, and Astarte; the walls of which were 150 feet high, proportionally broad, firmly built of huge blocks of stone, and cemented together with a strong white mortar.

This powerful city, once the capital of Phœnicia, the emporium of commerce, and mistress of the sea, equally famed for its trade, beauty, and opulence, and for many ages deemed impregnable, both from its almost inaccessible situation, and the strength of its fortifications made by art, is now a mere desert, and cannot boast of one house left entire. Its present inhabitants are only a few poor wretches who dwell in caverns, and subsist by fishing: such is the completion of Ezekiel's prophecies concerning it, of which we shall transcribe the words: "Thus saith the LORD GOD, behold I am against thee, O Tyre, and will cause many nations to come up against thee, as the sea causeth his waves to come up, and they shall destroy the walls of Tyrus and break down her towers; I will also scrape her dirt from her, and make her like the top of a rock; it shall be a place for the spreading of nets in the midst of the sea; for I have spoken it, saith the Lord, and it shall become a spoil to the nations." Ezek. chap. xxvi. 3, 4, and 5. It is uncertain what kings reigned before Abidol or Abecmal, who was contemporary with an enemy to king David. His son Hiram, who succeeded him, 1012 years before Christ, seems, however, to have been of a different disposition, for he not only maintained a strict friendship and alliance with David, but sent presents of cedar and skillful workmen to the royal palace; and on his demise transmitted to his son Solomon, by embassy, letters of condolence, which, with the answers, were extant in the time of Josephus, as that admirable Jewish writer

writer informs us. Hiram likewise not only furnished workmen, and the principal materials for building the Temple of Solomon, but advanced 120 talents of gold to forward that great work. Tyre was besieged 13 years together by Nebuchadnezzar, who at length subdued it 572 years before Christ, when he put all the inhabitants he could find to the sword, and destroyed the ancient Tyre. But many of the people had, in time, prudently retired with the chief of their effects, to an island at some distance from the shore, where they built New Tyre, or Tyre on the Island. This city, however, at length submitted to Nebuchadnezzar, who appointed Baal subordinate king thereof, under his own supreme authority. In the reign of Azelmic, and 232 years before Christ, Tyre was besieged by Alexander the Great, and taken by storm, after holding out seven months. He put to death the greatest part of the inhabitants either during the capture, or afterwards in cold blood: such are the horrors of insatiate war!

- "The wand'ring babes from mothers breasts are rent,
- "And suffer ills they neither fear'd nor meant;
- "No silver reverence guards the flowing age;
- "Nor rule nor method tie the boundless rage;
- "Nothing but fire and slaughter meet the eyes,
- "Nothing th' ear but groans and dismal cries.

COWLEY.

Alexander, hero-like, or (for we beg pardon for prostituting the epithet) bravo-like, after destroying the place, and murdering the inhabitants, was very sorry for his rashness: and, like other worthies of the same precipitate disposition, who become wise too late, determined to repair one evil by committing another; in consequence of which resolution, he seized most of the artificers in the neighbouring countries, and having compelled them to rebuild the city, he obliged them to reside in it, lest he should have a great city without any inhabitants. Such are the humanity and wisdom of many of the great heroes of antiquity, who fought for fighting sake; did injuries instead of redressing them, and quarrelled with every body to avoid being idle. Mr. Pope very justly observes,

- "Heroes are much the same, it is agreed
- "From Macedonia's madman to the Swede;
- "The whole strange purpose of their lives, to find
- "Or make, an enemy of all mankind;
- "Not one looks backward, onward still he goes,
- "Yet never sees an inch beyond his nose."

Having thus rebuilt and re-peopled this ancient city, he thought proper to stile himself the Founder of Tyre, in order we suppose to prevent the people from recollecting that he had been the destroyer of Tyre. The city in time recovered its beauty and opulence, became confederate with the Romans, and was invested with the privileges of a Roman city on account of its great fidelity. In the primitive times of christianity, it was made the Metropolis for the province of Phœnicia. In 636 it was conquered by the Saracens, but in 1124 recovered by the Christians. In 1280 it was finally subdued by the Turks, in whose hands it has continued ever since. Those infidels took it soon after the reduction of Acre or Acra, where they committed such unheard-of cruelties, that the Tyrians, terrified with the report thereof, betook themselves to their ships at midnight, and abandoned the city to their fury. They entered it the next day, and reduced it to the deplorable situation of which the dismal ruins are still a monument. We must not omit to observe that the Tyrians were particularly celebrated for dying purple, viz. a dog's lips being finely tinged by eating of the fish called conchidia. This fish is a buccinum, a name given by the ancients to all fishes whose shell bears any resemblance to a hunting horn; and it appears from Pliny that the famed Tyrian purple was obtained from it. This dye was so much valued in the time of the Roman emperors, on account of its being the imperial colour, that one pound of it

cost a thousand Roman Denarii, or above thirty pounds sterling.

Acra, or as the Franks call it, Acre or Acra, was antiently called Ace or Accho, then Ptolemais, and afterwards St. John D'Acre, while it was in the possession of the knights of St. John of Jerusalem. It is about 28 miles from Tyre, in 32 deg. 55 min. north lat. and 35 deg. 47 min. east long. and on the Levant sea; it is very inconsiderable to what it was. Acre was a long time a subject of contention between the Infidels and Christians, during the crusades or holy wars. In the year 1191, Richard the first, king of England, conquered it, and gave it to the before-mentioned knights, who held it 100 years with great bravery. The Turks, however, invested it with an army of 150,000 men, and took it May 19, 1291. Many of the inhabitants had previously retired to the island of Cyprus; those who remained behind were massacred by the infidels, who razed the fortifications, destroyed its noble edifices, and reduced it to the most deplorable state. The following singular circumstance is recorded on this occasion; a noble lady abbess, fearing that herself and her nuns might suffer violation from the brutality of the conquerors, proposed to her flock to cut and mangle their faces, that by the destruction of their beauty they might preserve their purity. To this she not only excited them by words but by her own example, which they immediately imitated. The Turks finding them such spectacles of horror, instead of the beauties they expected, cruelly put them to the sword: thus fell these heroic ladies by the means they laudably used to preserve their chastities. It is proper to observe, that when the Danes invaded England, the abbess of Coldingham acted in the same manner; we may therefore judge from the similarity of the expedient, that the lady of Acre copied the example of the English lady:

- "So dear to heav'n is faintly chastity,
- "That when a soul is found sincerely so,
- "A thousand livery'd angels lacquer her;
- "Driving far off each sign of sin and guilt,
- "And in clear dream, and solemn vision,
- "Tell her of things that no gro's car can hear;
- "Till oft converse with heavenly visitants,
- "Begin to cast and tear on the outward shape
- "The unpolluted temple of the mind,
- "And turn it by degrees to the soul's essence,
- "Till all be made immortal."

MILTON.

It was in this city that Edward I. then prince of Wales, received a wound with a poisoned arrow; but such was the conjugal fidelity of his princefs, that she sucked the poison from the wound, and by that means he was cured: such is the force of real love.

- "There is in love a power,
- "There is a soft divinity that draws transport
- "Even from distress, that gives the heart
- "A certain pang, excelling far the joys
- "Of gross, unfeeling life."

MALLETT.

The city has an excellent situation with respect both to sea and land, yet has never been able to recover its pristine splendor. It has two walls well fortified by towers and bulwarks, which are much decayed: among the magnificent ruins, with the walls, are the remains of the cathedral dedicated to St. Andrew, near the sea side, the church of St. John the titular Saint of the city, the convent of the knights hospitallers, the palace of the grand master of the order, and the remains of a large church belonging to the nunnery. Thevenot asserts, that when he saw the place, the remains of 30 churches were still visible.

Pancas or Casarea Philippi, a celebrated place antiently, but now nothing more than a poor village, at the foot of mount Panis, is situated near the source of the Jordan.

Damascus, a city much famed in ancient history, originally for the residence of the first Syrian kings, and

G g

after-

afterwards for being a regal fest of the Caliphs of the Saracens, is situated in 33 deg. 37 min. north lat. and 37 deg. 4 min. east long. With respect to its antiquity it is the most venerable in the whole universe; it is generally agreed to have been built by Uz son of Abraham, and grandson of Shem, the son of Noah, and was the birth-place of Eliezar the steward of Abraham. [1 Kings xi. 24.] It was possessed by the Mamelukes till 1506, when the Turks conquered it, and have kept it ever since; it is washed by the river Barady, formerly called the Chrysothoas, or Golden River; the form is an oblong square, about two miles in length; at a distance it appears like a city in a wood, from the great number of towers, domes, minarets, &c. interspersed with gardens and orchards. The water of the river is conveyed not only to all parts of the city, but into the neighbouring plain. The mosques, bagnios, bazars, khans, &c. are magnificent, but the private houses are low and mean, being erected either with sun-burnt bricks or mud; yet, though the houses are despicable, they are in general accommodated with stately apartments, square court yards, marble fountains and marble portals; one coffee-house in the town will contain 500 people; it is divided into two parts, the one for summer, the other for winter. In a large field called the Meidan, near the city, is an hospital for pilgrims and strangers of all religions, who are maintained at the Grand Signior's expence. The grand mosque is a magnificent edifice, and was formerly a Christian church, built by the emperor Heraclius in honour of Zachariah, the father of John the Baptist; but at present it is death for any one to enter it but a Mussulman. About the middle of the city there is a castle of an oval form, with strong walls 14 inches thick, flanked with square towers, mounted with cannon, and well furnished with arms, water, &c. Fifteen thousand janissaries garrison it, viz. 5000 to guard the city, 5000 to attend the sultan when he goes to Bagdad, and 5000 to escort the Mecca caravan. There is a large bake-house where biscuits are made for the pilgrims that are going to Mecca, as the Grand Signior allows them 200 camels load of biscuit, and the same quantity of water. The manufactures of Damascus are scymetars, knives, sword blades, bridle bits, and many other iron and steel wares, in which about 20,000 of the inhabitants are employed. Caravans bring hither the merchandizes of Turkey, Arabia, and India; and caravans are continually going to and returning from Bagdad, Aleppo, Mecca, &c. The city hath eight gates and strong walls. The principal streets both in city and suburbs are arched to keep off the sun and rain. The neighbouring territory is pleasant and fertile; the grapes are remarkably fine, some of the bunches weighing from 30 to 40 pounds; and the sheep, which are exceedingly large and their meat delicious eating, have tails that weigh in general 60 pounds. Near the city alabaster is found in great quantities, and a red earth efficacious as a remedy against the bite of venomous creatures. The corn is not here thrashed as in most other countries, but the straw is cut off with iron pincers, fastened to wooden rollers, drawn over the corn by a horse. Here the Jews have some handsome synagogues, and Christians of all denomination have their churches of worship according to their own communion. This city, by the Turks, is at present called Scan or Schan. The emperor Julian formerly styled it the city of Jupiter, the Eye of the East, and the Seat of Magnificence. Mahomet beholding it from a neighbouring mountain, was so delighted with the appearance of the city and its environs, that he refused to enter, or even approach any nearer to it, saying, "I am sure there is but one paradise designed for man, and I will not enjoy mine in this world." The following singular circumstances are by many authors said to have happened during the siege of this city by the Arabians, A. D. 634. One night some of the centinels, who were upon duty, heard the neighing of a horse, which was coming out of one of the city gates; they kept silent till it approached, when they took the rider prisoner. Immediately after there came out of the same gate another person on horseback, who called

the man that was taken prisoner by his name. The Saracens commanded him to answer them, and to submit, when the captive cried aloud in Greek "the bird is taken." The person to whom these words were spoken, comprehending their meaning, galloped back again to the city, though the Saracens knew not what the prisoner had said, as none of them happened to understand the Greek language; yet they were sensible that by his means they had left a prisoner: they therefore carried him before Khaled their general, who demanded what he was: "I am, replied he, a nobleman, and have married a lady who is dearer to me than life; but, when I sent for her home, her parents made a slighting answer, and said they had other business to mind. Having found an opportunity to get to the speech of her, we agreed to leave the city in the evening, and for that purpose to give a considerable sum of money to the person who should be on guard that night: I leaving the city first was surprised by that man, and to prevent my beloved wife from falling into his hands, I cried, The bird is taken. The dear creature understanding my meaning, returned with her two servants into the city, and who can blame me for showing such tenderness?" Said the general, "Then what think you of the Mahometan religion? embrace it, and your wife shall be restored to you when we take the city; refuse, and you are a dead man."

The poor wretch being terrified, renounced the Christian faith in these words, "I testify that there is but one God; he has no partner, and Mahomet is his prophet:" then devoting himself to the Infidels, he distinguished himself in fighting against the Christians. Damascus being taken, Jonas, for that was his name, ran in search of his beloved, and was informed that she had immured herself in a nunnery, thinking that she should never see him any more. He flew to the convent, discovered himself to the lady, and at the same time informed her of his having changed his religion. This information induced her to treat him with the utmost contempt, and to conclude, that as he had renounced the Christian religion, it was her duty to renounce him. Agreeable to this resolution, she left the city with the Christians, who were permitted to depart. Jonas, in the utmost distraction applied to the general, and entreated him to detain her by force, but Khaled replied, "that he could not do any such thing; but as the Christians had voluntarily surrendered, he should suffer them to depart according to the articles of capitulation."

Soon after, however, the Saracen chief repenting that he had favoured them with such mild terms, and suffered them to carry away so much wealth, determined to pursue and plunder them. Jonas strongly urged the infidel to execute his resolution speedily, and offered to be his guide. They therefore left the city, at the head of 4000 horse, being all disguised like Christian Arabs; they soon came up with the Christians, a sharp contest ensued, but the Saracens proved victorious. During the engagement, Jonas got among the women in search of his wife. Rapih Ebn Omeirah, passing that way, saw him scuffling with his lady, whom he had thrown upon the ground with some violence; and Rapih himself leaped upon the daughter of the emperor Heraclius, and the beautiful widow of Thomas, a Christian chief who had been killed in the engagement. Having secured his captives, he returned to the place where he had left Jonas, when he found him bathed in tears and his wife weltering in her blood. Enquiring the occasion, Jonas wrung his hands, and cried, "Alas! I am the most miserable creature existing. I came to this woman, whom I prized above all things, and would fain have persuaded her to return with me; she was, however, deaf to my entreaties, because I had changed my religion, and vowed she would retire to a cloister to end her days. Not being able to persuade by tender entreaties, I determined to employ force, and therefore threw her down and took her prisoner; when she suddenly drew out a knife, stabbed herself in the breast, fell down at my feet, and instantly expired." Rapih could not refrain from tears at this mournful relation; at length he said to comfort him,

him; "Heaven did not intend that you should live with her, and has therefore provided better for you." "What do you mean?" said Jonas, "I'll shew you, replied Raphi, a lady that I have taken of admirable beauty, and in the richest attire; I'll make you a present of her to compensate your loss."

Jonas being brought to the princess conversed with her in Greek, and received her as a present from Raphi.

After the carnage had ceased, the general, hearing that the emperor's daughter was taken, demanded her of Jonas, who freely resigned her, and received a present which Khaled thought proper to make; Jonas continued ever after afflicted with the deepest melancholy, a just punishment for his apostasy, for which he was finally rewarded at the battle of Yermuk, being shot through the breast.

The above story furnished the ingenious John Hughes Esq. with the plot of his excellent tragedy, called the Siege of Damascus. He has disguised the names of some of the principal characters agreeable to that licence, which is allowed to poets, and likewise in some measure deviated from the story. We shall conclude this digression, which we flatter ourselves will not be deemed uninteresting, with the following reflections upon death, made by Jonas, (or Phocas, as he is called in the play) when Khaled threatens to take away his life:

"What art thou, O thou great mysterious Terror?
"The way to thee we know; diseases, famine,
"Sword, fire, and all thy ever-open gates,
"That day and night stand ready to receive us;
"But what's beyond them? who will draw that veil?
"Yet Death's not there! No, 'tis a point of time,
"The verge 'twixt mortal and immortal being;
"It macks our thought; on this side all is life,
"And when we've reach'd it, in that very instant
"Tis past the thinking of. O if it be
"The pang, the throes, the agonizing struggle
"When soul and body part, sure I have felt it,
"And there's no more to fear."

Balbec, was called by the Greeks Heliopolis, or the City of the Sun. Its venerable ruins evince that it was once one of the most magnificent cities in the universe; at present it is not above a mile and a half in circumference, and the poor inhabitants live in mean houses, no ways answerable to the grand ideas which the surrounding ruins give us of the dwellings of their ancestors.

The honourable Van Egmont says, "Balbec, now called Baalbec, is probably the ancient Heliopolis, or City of the Sun; and its new name seems to correspond with the ancient Baal in the Phœnician language, signifying an idol, particularly that of the sun. And what seems to confirm me in my opinion that Balbec is the ancient Heliopolis, or City of the Sun, was a medal of Philippus Cæsar, which I found here. He is on one side represented as a youth without beard or crown; and on the reverse are two eagles with the ends of their beaks joined, and between them these two words, COL. HELL. whence it is plain that this city was at that time a Roman colony." It is situated in one of the most delightful plains in the world, at the foot of mount Antilibanus towards the westward: it is about 30 miles north of Damascus, and the same east from the sea coast, in 33 deg. north lat. and 37 deg. 30 min. east long. This place was by the Arabians called the Wonder of Syria; and the magnificent ruins are certainly the admiration of all travellers who behold them. A superb palace, a noble temple, and some other ruins, stand at the south-west of the town; and having been patched and pieced in later times, are converted into a castræ, as it is called. In approaching these venerable edifices, a rotunda or round pile attracts the view, encircled with pillars of the Corinthian order, which support a cornice that runs all round the structure. The whole, though greatly decayed, exhibit marks of astonishing elegance and grandeur, being built of marble, circular without, and octangular within. The Greeks, by whom it hath been converted into a church, have

taken infinite pains to spoil its beauty, by daubing it with plaster. There is a superb lofty building contiguous to the rotunda, which leads to a noble arched portico of 150 paces in length, that conducts you to a temple of astonishing magnificence, which to a miracle hath withstood the injuries of time. It is an oblong square of 192 feet in length on the outside, and 120 within. The breadth on the outside is 96 feet, and within 60. The whole is surrounded by a noble portico, supported by pillars of the Corinthian order, each of which consists only of three flones, though the height is 54 feet, and the diameter six feet three inches; they are nine feet distant from each other, and from the wall of the temple: their number on each side of the temple is 14, and at each end eight; the architrave and cornice are exquisitely carved and embellished: round the temple, between the wall and pillars, is an arcade of large flones hollowed out archwise, in the centre of each of which is a god, goddess, or hero, executed with such animation as is scarce conceivable. Round the foot of the temple wall is a double border of marble, whose lower parts are filled with basso relievo miniatures expressive of heathen ceremonials and mysteries. The entrance to the temple is the most august imaginable, the ascent being by 30 steps, bounded by a wall on each side that leads to a pedestal, on which a statue formerly stood. The front is composed of eight Corinthian pillars, fluted like those that go round the temple, and a nobly proportioned triangular pediment; in the midst of these pillars, at six feet distance, are four others, resembling the former, and two more with three faces each: all these form a portico 60 feet broad and 24 deep before the door of the temple. Under the vault of the portico the entrance of the temple appears through these pillars in admirable proportion. The portal is square, and of marble, 40 feet high and 28 wide, the aperture being about 20; from this portal the bottom of the lintel is seen, embellished by a piece of sculpture not to be paralleled in the universe; it represents a prodigious large eagle in basso relievo; his wings are expanded, and he carries a caduceus in his pounces; on either side a Cupid appears holding the one end of a ribbon by a ribbon, as the eagle himself holds the other in his beak, in a manner imitatively fine. The temple is divided into three isles or aisles, two narrow on the sides, and one broad in the middle, by three rows of fluted Corinthian pillars of near four feet in diameter and about 36 feet in height, including the pedestal: the pillars are 12 in number, six of a side, at 18 feet distance from each other, and 12 from the walls. The walls themselves are decorated by two rows of pilasters, one above the other, and between each two of the lowermost is a niche 15 feet high; the bottoms of the niches are upon a level with the bases of the pillars, and the wall to that height is wrought in the proportion of a Corinthian pedestal: the niches themselves are Corinthian, and executed with inimitable delicacy. Over the round niches are a row of square ones between the pilasters of the upper order: the ornaments are marble, and the pediment triangular. At the west end of the middle isle, you ascend to a choir by 13 steps: the choir is distinguished from the rest of the fabric by two large square columns adorned with pilasters, which form a superb entrance. The profusion of admirable sculpture here is astonishing; but the architecture is the same as in the body of the temple, except that the niches stand upon the pavement, and the pillars are without pedestals. The principal deity formerly worshipped here stood in a vast niche at the bottom of the choir. The choir is open towards the middle. The whole pile stands upon vaults of such excellent architecture, and so bold in their construction, that it is imagined they were designed for something more than merely to support the superincumbent building. This temple anciently was accompanied by some other magnificent buildings, as is evident from four ascents to it, one upon each angle, with marble steps long enough for ten people to go up a-breast.

The palace, which is in what the Turks call the Castle, must have been one of the most superb structures that imagination can conceive, but it is much more decayed than the temple. It ought to be observed, that

that the old wall which encloses both these structures is composed of such prodigious blocks of stone as almost transcends belief; three in particular that lie close to each other in a line extend 183 feet, one being 63 feet in length, and the other two 60 feet each. A dark arched vault, containing many busts, leads to an hexagonal building which forms a spacious theatre; the end opens to a terrace which is ascended by marble steps; you then enter a square court surrounded by magnificent buildings: on each hand are double rows of pillars, which form galleries of 66 fathoms in length and eight in breadth. The bottom of this court is occupied by a building amazingly sumptuous, which appears to have been the body of the palace; the columns are as large as those of the Hippodrome at Constantinople, nine of them are standing, and a good piece of the entablature. But it is surprising that each of these large columns is made of one entire block only. All the buildings in this castle front the east, and the Corinthian order prevails throughout the whole: there is no place where such precious remains of architecture and sculpture are to be found, as the fine taste of Greece, and the magnificence of Rome seem to be blended; the ornaments are at once innumerable and exquisite. Beneath the whole are vaults, in which vast flights of marble stairs, of 200 steps in a flight, are frequently found. The turn and elevation of these vaults are bold and surprising; they contain many noble halls and superb apartments, admirably decorated. Some of these vaults are dark, others receive light from large windows which stand on the level of the ground above: but the most singular circumstance is, that all these astonishing edifices are built with such enormous stones, as those before-mentioned, without any visible signs of mortar, or any kind of cement whatever. The present city is surrounded with a wall of square stones, and some towers in good condition; the gardens in the environs are pleasant, fruitful, and well watered. Many houses which contain various apartments, are cut out of the solid rocks. It is inhabited by about 30 or 40 Christian families, a few Jews, and near 800 Turks.

S E C T. XVIII.

Palestine, Judæa, the Land of Canaan, or the Holy Land.

THE third grand division of Syria, taken in its largest sense, is the ancient kingdom of Judæa, or Judæa, or Palestine; the former of these names it received from Judah, whose tribe was the most considerable of the twelve, and the latter from the Palestinians, or Philistines, as they are termed in scripture, who possessed the greatest part of it; it had likewise a variety of other names, such as the Land of Canaan, the Land of Israel, the Land of God, the Land of the Hebrews, &c. but the most pre-eminent appellation by which it hath ever been distinguished is, the *Holy Land*.

The name of Canaan it received from the descendants of Canaan the son of Cham, or Ham, who, being expelled by the Israelites, it was thence called the Land of Israel. Both Jews and Christians call it the Holy Land, for these distinct reasons: the former give it that epithet, because it was solely appropriated to the service of God under their immediate dispensation; and the latter so call it, because Christ was born here, and it became the scene of all that was wrought or suffered for the SALVATION of MANKIND. It was figuratively called the Land of Promise, as having been promised by God himself to the chosen people of Israel, and the land flowing with milk and honey, from its wonderful fertility. Under the general name of Canaan, Judæa, or Palestine, some include the whole of the land possessed by the twelve tribes, though it peculiarly belongs to no more than the country west of the river Jordan, which Moses himself particularly points out, Deut. ii. 29, in this expression, "Until I shall pass over Jordan into the land which the Lord our God giveth us." Judæa, in the general extent of it, must therefore be divided into Lesser and Greater: the Greater Judæa extended from the Mediterranean to the Euphrates. This division was never peaceably possessed by the Jews, though they in some measure

subverted most of the Syrian powers. The Lesser was confined to the land possessed by nations particularly marked out for expulsion and extermination. This is evident from the commands of God himself; for when the armies of the Israelites marched against any of the cities in the former, they were ordered to make offers of peace; but in the latter no conditions were to be proposed, but the inhabitants totally destroyed and rooted out.

The exact extent of Canaan seems to have been accurately pointed out by Moses in Gen. x. 18, 19, in these words, "The border of the Canaanites was from Sidon, as thou comest to Gerar unto Gaza, as thou goest unto Sodom and Gomorrah, and Admah and Zeboim, even unto Lashah." The four angles wherein the four borders of the land met, are plainly described, as the following diagram will evince:

Palestine, or Judæa, is situated between 31 deg. 30 min. and 32 deg. 20 min. north lat. and from 34 deg. 50 min. to 37 deg. 15 min. east long. being bounded by the Mediterranean sea on the west, Syria and Phoenicia on the north, Arabia Deserta on the east, and Arabia Petraea on the south. It is therefore near 200 miles in length, and about 80 in breadth towards the middle, but increases or diminishes 12 or 15 miles in other places; the longest day is about 14 hours 15 minutes.

The air of Judæa is the most salubrious and pleasant imaginable; neither heat nor cold are felt in the extreme, but an agreeable serenity diffuses itself throughout the year, which puts the stranger in mind of the golden age:

"The flowers unfown in fields and meadows reign'd,
And western winds immortal spring maintain'd."

Though the climate of this country is at present the most admirable in the universe, we have no doubt but in the early ages of the world, when the pastoral life was the most honourable, and agriculture the most respected employ, it even exceeded its present excellency, by means of the general cultivation of the country. Of the richness and fertility of its soil we have the most authentic testimonies; in particular that it abounded in corn, wine, oil, honey, pomegranates, dates, figs, citrons, oranges, apples of paradise, sugar-canes, cotton, hemp, flax, cedars, cypresses, and a great variety of other stately, fragrant, and fruitful trees, balm of Gilead, and other precious drugs, &c. cattle, fowls, fish, game, and other delicacies, as well as necessaries of life. Indeed, whoever considers the very small extent of Judæa, will be sensible that nothing but such astonishing fertility could enable it to maintain such a number of inhabitants as resided in it in the time of King David, since they amounted to 6,000,000. The produce of the land not only subsisted this prodigious multitude, but there was a sufficient superfluity to send to Tyre and other places for exportation. Yet the soil was only cultivated six years in seven, as the septennial year was always a time of rest from the affairs of agriculture. It is to be observed, that the whole of the country was cultivated, and that woods, parks, waste grounds, &c. were unknown. It is now unhappily inhabited by some

A few
considerab
account of
ticularly n
them: of

of the most indolent people existing; yet Dr. Shaw informs us, that with a little cultivation it would yield as much as it did in the days of king David and king Solomon.

The principal mountain of Palestine is the famous chain that goes under the name of Libanus and Anti-libanus, and divides Syria from Palestine: the whole is about 100 leagues in compass, and consists of four ridges one above another, two of which are fertile, and two barren, viz. the lower is rich in grain and fruit; the next rocky and barren; the third abounds in gardens and orchards, though higher than the preceding; and the summit is sterile and uninhabitable, by reason of the excessive coldness on its airy brow: the Maronites inhabit its lower regions, and Arabs all the other parts except the top. In this mountain several considerable, or rather celebrated rivers have their source, viz. Jordan, Rocham, Nahur-Rossian, Naha-Codicha, and Aboutai, the first only of which runs through Palestine. Of these mountains the western part alone is properly called Libanus, the eastern being named Anti-libanus, and the intervening part Cerco-Syria. The whole chain, however, always was, and is still looked upon as a retreat for robbers.

Mount Hermon, like Libanus, is very high, and capped with snow the greater part of the year.

Mount Tabor, anciently called Mons Alabyrius, and Ilabyrium, from a city of that name which stood upon it, is admirable with respect to its constant verdure, beauty, fertility, and regularity, as well as for its situation, which is in the middle of a large plain, at a distance from any other hill: a winding ascent of about two miles leads up to it, and the plain, on its top, is half a mile in length, and a quarter of a mile in breadth. This mountain was the scene of our Saviour's transfiguration, and consequently is held in great veneration, and has been much resorted to by Christians of all ages.

Mount Carmel, situated on the sea shore, is the most remarkable head-land on that coast. The prophet Elijah is supposed to have resided here in a cave, which is still shewn, previous to his being taken up to heaven. The cave is 18 feet in length, and 11 in breadth.

Mount Olivet, or the Mountain of Olives, is only about a mile from Jerusalem, being separated therefrom by the brook Kidron, and the valley of Jehoshaphat. It is of a considerable height, and from its summit there is a fine prospect of Jerusalem. It runs in a ridge, and has three or four heads higher than the rest; from one of the principal Christ ascended into heaven, and the impression of a foot in a hard rock, shewn there at this day, is said to have been made by him.

Mount Calvary, or Golgotha, was the place where our Saviour was crucified. It is a rocky hill on the west side of Jerusalem, and was anciently used as a general charnel-house to that city, from whence it derived its name of Golgotha, that Hebrew word signifying the place or repository of a skull, of which Calvary is the Latin translation. This mountain, according to the authority of the ancient fathers, is the same on which Abraham went to offer up his son Isaac. It was formerly the place where criminals were executed, but, since the crucifixion of Christ, it hath been so revered and resorted to by Christians of all denominations, that it hath, if we may be allowed the expression, drawn the city round about it, for it now stands in the midst of Jerusalem. Constantine the Great inclosed it within the new walls, and even left out some part of Mount Sion, that none of Calvary should be excluded.

Mount Moriah is the eminence on which the temple of Solomon was built.

Mount Githon stands about a quarter of a mile from Jerusalem, and on it the pool is still to be seen from whence Hezekiah brought water by an aqueduct into the city.

A few other mountains are found in Palestine less considerable than the former, yet worth mentioning, on account of many singular circumstances which are particularly noticed in the Holy Scriptures concerning them: of these, we shall begin first with Mount Ebal,

or Hebal, and Mount Gerizim. These mountains are both remarkable on account of the following particulars: Moses had enjoined, that when the children of Israel had passed over Jordan, they should set upon Mount Ebal great stones, and, having covered them with plaster, should write the law upon them; vide Deut. xxvii. 2, 3, 4; and they were to build an altar there unto the Lord their God, and to offer burnt-offerings, and peace-offerings; and to celebrate a feast unto the Lord; vide ver. 5, 6, 7, of the same chapter: and they were to divide the people, and to place six of the tribes of the people on Mount Gerizim, opposite to Mount Ebal, and six on Mount Ebal; and then the Levites were to read, with a loud voice, the curses set down by Moses for the transgressors of the law, unto each of which the people were to answer, Amen. [See the succeeding verses of the same chapter.] Joshua afterwards performed the whole of the above injunction.

Mount Engadi is near the lake of Sodom: Mount Amalek and Gahash, in the tribe of Ephraim: Piggah and Nebo, on the other side Jordan, whence Moses was permitted to view the Land of Promise: the Mountains of Gilboa, famed for the defeat of Saul and Jonathan, and the chain of hills called the Mountains of Gilead, extend from north to south beyond Jordan, and are celebrated for their excellent resin or balsam.

The principal inland seas, or rather lakes, are, the Dead Sea, or Lake of Sodom; the Sea of Galilee, or Lake of Tiberias; and the Samachonite Sea, Sea of Jezar, or Lake of Samachon.

The Dead Sea, Lake of Sodom, Asphaltite Lake, or Salt Sea, hath had many reports concerning it, that have been found by the most judicious travellers, and repeated experiments, to be erroneous; particularly that nothing would sink in it; that it cast such a stench and smoke, that the very birds died in attempting to fly over it; that there grew apples about it fair without, but all acrid and bitterness within; and that the ruins of the fine cities that were destroyed by fire from heaven, were still to be seen under the water in clear weather; that a smoke constantly ascended from it, &c. All these absurd notions have been refuted from scripture itself by Reland, in his *Palestine Illustrata*. This lake is called Asphaltite, from the quantity of bitumen in and about it. Formerly it was imagined that great quantities of this combustible were thrown up by this sea; that, however, is not the case, for it is the mountains on both sides that produce it. It resembles pitch, and is only to be distinguished from it by the sulphureousness of its taste and smell. For the bitumen itself some have mistaken a black pebble found on the shores of the lake, which being held in the flame of a candle, presently takes fire, and burns with a most intolerable stench. Besides the above quality, these pebbles have this singular property, that by burning, their weight only, and not their bulk, is diminished. It is termed the Dead Sea, because it is supposed that no living creature can exist in it, on account of the excessive saltiness of its waters: Maundrell, however, insists that it contains fish, and likewise gives testimony against another received opinion, that is, if any birds attempted to fly over it, they were sure to drop down dead in it; but he declares that he saw many fly over it. Why it was called the Salt Sea is obvious, and it is imagined that no collection of waters in the universe have to great a degree of saltiness. The great physician Galen observes, that the exceeding saltiness of the water is tinged with an unpleasant bitterness; and that, with respect to specific gravity, it as much exceeds other sea waters, as they do river waters. It is about 24 leagues in length, and between six and seven in breadth. It is bounded on the east and west by exceeding high mountains; on the north by the plains of Jericho; but to the south the view is entirely open beyond the reach of the eye. The waters are clear, limpid, and transparent.

The Sea of Galilee, or Lake of Tiberias, is much smaller than that of Sodom, but abounds in fish, and is highly commended for the excellency of its waters. It was on this sea that St. Peter, Andrew, John and James, followed their employ as fishermen: the river Jordan passes through it.

The lake of Samachon is an hundred furlongs north of that of Tiberias, near the source of the river Jordan; it is between seven and eight miles in length, but not above half a mile broad where widest.

There are two other small lakes in Judea named Phiala and Jazar, but they are too inconsiderable to merit any description.

Jordan is the most considerable, or indeed the only river in this country. It takes its source at the lake of Phiala, enters the Samachonite lake, whence proceeding it divides the sea of Galilee, and at length discharges itself into the Dead Sea: after rising at Phiala, it runs under ground for the space of 15 miles, then appearing again at Panoum, it passes the before mentioned Samachonite lake, flows for 15 miles more, enters the sea of Tiberias, and having past it, streams through a desert till it disengages itself into the Asphaltite lake. Contrary to the general nature of rivers it is fullest in summer time: its banks are so covered with tall reeds, willows, tamarisks, &c. that they harbour innumerable lions and other wild beasts. Its stream is so rapid and strong that a man cannot stem it in swimming. The breadth where it is widest does not exceed 60 feet; the waters are salubrious and incorruptible, but turbid or muddy, the natural consequence of its rapidity.

The other rivers, or rather rivulets, are Arnon-Jabok, Cherith, Sorc, Kishon, Boior, Belus, Nahar-al-farat, and Jezreel.

The principal vallies and plains mentioned in scripture, and by profane writers are,

Berakhap, or the valley of Blessing, on the west side of the lake of Sodom; the vale of Siddim, which contains the Asphaltite lake; the valley of Shaveh or Royal Vale, the valley of Salt, the valley of Jezreel, the vale of Mambie, the vale of Rephaim, the valley of Jehoshaphat, the valley of the children of Hinnoom, the vale of Zeboim, the vale of Achor near Jericho, the vale of Bochim, and the valley of Elah, where David slew the giant Goliath:

Where it was provid' that he hath greatest might,
Whose heart is godly, and whose cause is right:
Thus weakness may superior strength disgrace,
And the most swift, if impious, lose the race;
Giants in fin, shall like Goliath fall,
And Davids, arm'd by Providence, prevail.

Among the plains are those called the Great Plain, through which the river Jordan flows, the plain or valley of Jezreel, the plains of Sharon and Sephelah, and the plain of Jericho.

The whole country at present is a perfect wilderness, through the want of cultivation: anciently, when in its most flourishing state, it was said to contain some deserts or wildernesses; but this is to be understood of such tracts as produced no corn, wine, oil, &c. but were set apart for feeding cattle, flocks of sheep, goats, &c. There was not a sterile spot throughout the whole country, the people therefore had no conception of barrenness. Happy land! where rich pastures and beautiful meadows were termed deserts, through the absence of real barrenness; where the peoples ideas of fertility were confined only to spots productive of a profusion of luxuries.

Many natural curiosities are found in this country, particularly stones which exactly resemble citrons, melons, olives, peaches, bunches of grapes, and even many kind of fish; they are found principally about mount Carmel: those that resemble olives are the Lapidis Judaici, which hath always been deemed an excellent remedy for the stone and gravel. Near Bethlehem are found little stones which greatly resemble peas, they are therefore called the Virgin Mary's Peas; and another stone of a chalky nature, goes under the appellation of her milk; a stone of the slate kind, which is found not only here but in Phœnicia and Syria, exhibits in every flake the representation of a great variety of fishes. We may include among the natural curiosities many hot and mineral waters. Near the Dead Sea are a number of hillocks resembling places where there have been lime kilns, and abundance of saline effluences.

A thorny bush grows in the plains of Jericho, which bears a fruit that has some similitude to an unripe walnut; from this fruit the Arabs extract an excellent oil, which is a sovereign remedy for bruises, when internally applied, and for wounds when used externally. Its reputation is so great that it is preferred even to the balm of Gilead.

Two more natural curiosities abound in this plain of Jericho, viz. the wood-olive, the outward coat of which is green like the common olive, but being taken off, a nut of a woody substance appears; it is of about the thickness of an almond shell, and ribbed longwise. Also the caroub or locust tree that bears a fruit like a bean, in which are some small seeds; the shell when dried is eaten, and has a very agreeable taste. St. John sojourned here, whence it is called St. John's delarts; and these are thought to be the locusts on which he fed, and not the animal of that name as many have supposed.

Judea was peopled by the descendants of Amor Cham, who came hither with his eleven sons after the confusion of tongues at Babel, five of whom settled in Syria and Phœnicia, viz. Heth, Jebus, Emor, Girsahii and Heve, who were the founders of so many nations, and these were afterwards encreased by the descendants of Abraham; that patriarch having been called out of Mesopotamia to sojourn here.

We shall now particularize the districts allotted to the several tribes, beginning with the two tribes and a half who settled beyond Jordan, and then proceeding to the opposite side, take in the other nine tribes and a half as they lie from north to south.

The lot of Ruben extended along the banks of the river Jordan from the north-east coast of the Dead Sea, and was bounded on the east by the country of the Moabites and Ammonites, on the south by the river Arnon, which separated it from the country inhabited by the Midianites, and on the north by a small river, which parted it from the lot of Gad: it formerly contained many good cities, of which there are no particular ancient descriptions known, nor any traces of the towns themselves at present remaining.

The lot of Gad had half the tribe of Manasseh on the north, Ruben on the south, the Ammonites on the east, and Jordan on the west; though naturally a country of infinite richness and fertility, it at present appears like a wilderness; neither any modern built towns appear in this tract, nor the remains of the ancient.

The lot of half the tribe of Manasseh had Gad to the south, mount Lebanon to the north, Jordan and the Samachonite lake to the west, and the hills of Bashan and Hermon on the east. This district, with respect to cultivation or cities, is in the same predicament as the two former.

The lot of the tribe of Asher, on this side Jordan, was bounded on the north by Phœnicia, on the south by Zabulon, on the east by Naphtali, and on the west by the Mediterranean: of all the cities and towns belonging to the descendants of Asher, none are now remaining except Acre, which we have already described, Saphat, a town near Acre, was destroyed in the year 1759, by an earthquake, which did a great deal of damage all over Syria, but more particularly about Damascus.

The tribe of Naphtali extended along the western banks of the Jordan, from Lebanon to the sea of Galilee. No vestiges of any of the ancient cities are now in being, and the very few villages are so poor and inconsiderable that travellers scarce mention them. We shall nevertheless notice some particulars relative to two of its ancient cities, viz. Capernaum and Dan, though they no longer exist.

Capernaum, doctor Wells takes notice, is not mentioned in the Old Testament; it was therefore most probably one of the towns built by the Jews after their return from the Babylonish captivity, on the sea coast, that is on the coast of the sea of Galilee, in the borders of Zabulon and Naphtalim, and consequently towards the upper part of that coast: it took its name from an adjoining spring, famed for the excellency of its chrysaline waters. place of his residence, in preference to Nazareth, where the stubbornness and incredulity of the people had obstructed the propagation of his doctrines. It was more particularly the place of his abode during the last three years of his life; and where he wrought a great number of miracles. Christ, however, informed the inhabitants, that though their city was then *exalted unto heaven*, it should shortly be *brought to hell*, that is, to the most deplorable situation; see Matthew xii. 23. which prediction was verified in the Jewish wars, when it was totally destroyed; so that there is not at present the least trace of it left, unless six poor fishermen's cottages may be so termed.

Dan, this city was built by the Danites, who being too straitened in their own tribe, and seeking for a new habitation, those of Zerah and Eshbaal armed 600 men, who seized the rich town of Laish, destroyed its inhabitants, burnt the city, then rebuilt it, and called it Dan, after the name of their progenitor. It was probably the same as Laish, mentioned Genesis x. 19, as one on the borders of the land of Canaan: it was situated at the head of Jordan, and after having received its new name, was deemed the northern boundary of the land of Egypt, as Beerseba was the southern. Hence the proverbial scripture expression, from Dan to Beerseba. It was here that Rehoboam placed one of his golden calves. Dan was given by Augustus to Herod the Great, who bequeathed it to his younger son Philip, (together with the Tetrarchy of Eturia and Trachonites) who made it his capital, and called it Ciesarea Philippi.

The tribe of Zebulun had the Mediterranean on the west, the sea of Galilee on the east, Ilfahar, from which it was parted by the brook Kithon, on the south, and Naphtali and Ather on the north. The principal town of this district is Nazareth, where our Saviour was brought up; it is now a very inconsiderable village, though once a fine city, situated in a kind of concave valley, on the top of a hill. A convent is here built over the place of the annunciation: the monks shew a house, which they insist was the house of Joseph, in which Christ resided near 30 years.

Bethsaida is frequently mentioned in the New Testament; Saint John, chapter i. 44. expressly tells us, that Saint Peter, Andrew, and Philip were of this city; the name in Hebrew implies a fishing place. It is not mentioned in the Old Testament, nor is that indeed astonishing, since it was but a trifling village, as Josephus informs us, till Philip the Tetrarch rendered it a magnificent, rich, and populous city; at present it only consists of five or six poor cottages.

Joppa, or Jafia, as it is at present called, is situated on the Mediterranean coast: it was anciently the principal sea-port town to Jerusalem and all Judea, and the place where the cedars of Lebanon, brought in floats from Tyre for building the temple, were landed. It was pleasantly seated on a rock in a beautiful plain, and situated in 30 deg. 20 min. north lat. and 35 deg. 3 min. east long. Jonas here embarked for Ninevah; and from the history of his miraculous voyage, the story of Andromeda was fabricated by the heathen poets; for their sea-monster was no other than the Leviathan of the sacred writings, and the whale of the moderns.

—“Huge Leviathan unwieldy moves,
“And thro’ the waves a living island roves;
“In dreadful pastime terribly he sports,
“And the vast ocean scarce his weight supports.
“Where’er he turns, the hoary deeps divide;
“He breaths a tempest, and he spouts a tide.

BROOME.

We cannot help adding the sublime description given by Job of this tremendous creature, which the antients so terribly dreaded, and which the moderns have found the means not only to subdue, but to render subservient to many domestic uses.

“His bulk is charg’d with such a furious soul,
“That clouds of smoke from his spread nostrils roll,
“As from a furnace, and when rous’d his ire,
“Fate issues from his jaws in streams of fire.

“The rage of tempest, and the roar of seas,
“This great superior of the ocean pleases:
“Strength on his ample shoulders sits in state,
“His well join’d limbs are dreadfully complete;
“His flakes of solid flesh are slow to part,
“As steel his nerves, as adamant his heart:
“Large is his front, and when his burnish’d eyes
“Lift their broad lids, the morning seems to rise.
“His pastimes like a cauldron, boil the flood,
“And blacken ocean with the rising mud;
“The billows feel him as he works his way,
“His hoary footsteps shine along the sea.”

Dr. YOUNG’S Job.

It was in Joppa that Saint Peter raised Dorcas to life, and received the messengers of Cornelius. Though it was anciently a very magnificent town, and a great commercial mart, yet the harbour was never commodious, on account of several rocks, which render the passage into it dangerous. It lay for many ages in ruins, but of late hath been much improved, though it still falls beneath its original splendor. The lower ground towards the sea is covered with good houses, chiefly of stone. The principal commodities are Ramah, and Jerusalem soap; rice, and other articles are brought from Egypt, and exported from hence to various places, which yields the balsa of Gaza a considerable annual income. The inhabitants are supplied with water from an excellent spring on the west side of the town. The Christians as yet have no church, except one almost in ruins and uncovered; but they have several handsome houses appropriated to their use, and for the entertainment of pilgrims.

Cana of Galilee, so called to distinguish it from a town of the same name, which lay near Sidon, is not far from Nazareth. Here Christ performed his first miracle, by changing the water into wine at the marriage feast. The mention of the above brings to our mind the following circumstance: A young gentleman of great genius, who was placed in a certain seminary of learning for education, a few years since having the Miracle of Cana given him as a theme, neglected to prepare it for the inspection of the master, till within a few minutes of the time when it was proper to produce it; fearful of being punished for his remissness, he sat down and compressed the whole in the following admirable line:

“The modest water saw the Lord and blush’d.”

The master was so charmed with the energy of this sentence, that he easily pardoned the young pupil for not rendering his theme more prolix.

Cana was the native or at least dwelling place of the Apostle Nathaniel, or Bartholomew; for he is expressly styled Nathaniel of Cana in Galilee, vide John xxi. 2.

The lot of the tribe of Ilfahar was bounded on the north by Zebulun, on the south by the other half of Manasseh, on the east by Jordan, and on the west by the Mediterranean. It contained the mounts Carmel and Gilboa, the valley of Jezreel, and plain of Galilee, now called Saba: though its fertility is astonishing, it contains only a few miserable inhabitants, who reside in scattered huts, and has scarce any remaining traces of the cities, towns, or villages, which it might formerly contain; but as some of the places in their ancient state were extremely remarkable, we shall mention them on account of some curious circumstances with which they were connected.

Shunem, or Shunen, was a city, according to Joshua, xix. situated on the borders of the tribe of Ilfahar. In the 1 Samuel, chapter xxviii. 4. it mentions that the Philistines pitched here, as the Israelites did in Gilboa. This city was likewise famous, as the place of residence of the hospitable Shunamite, who was so kind to the prophet Elisha. Her benevolence, and its happy consequence, furnished Mr. Stephen Duck with the idea and subject matter of his celebrated poem called, *The Shunamite*, which not only occasioned his advancement from the plough to the pulpit, but procured him the royal favour, and patronage of queen Caroline. Accept of the following sketch of that pleasing performance, which the author hath put into the mouth of the Shunamite herself, who thus addresses the people:

“My

" My lord and I, to whom all bounteous heav'n
 " His blessings with no sparing hand had given,
 " Like faithful stewards of our wealthy store,
 " Still lodg'd the stranger, and reliev'd the poor :
 " And as ELISHA by divine command,
 " Came preaching virtue to a sinful land,
 " He often deign'd to lodge within our gate,
 " And oft receiv'd an hospitable treat :
 " A decent chamber for him we prepar'd ;
 " And he, the gen'rous labor to reward,
 " Honors in court or camp to us propos'd ;
 " Which I refus'd, and thus my mind disclos'd :
 " Heav'n's king has plac'd us in a fertile land,
 " Where he show's down his gifts with copious hand ;
 " Already we enjoy a fluent store,
 " Why should we be solicitous for more ?
 " All blessings but a child hath heav'n supply'd,
 " And only that th' Almighty has deny'd.
 " Which when the holy precient fage had heard,
 " He said—
 " —Hail, gen'rous soul ! thy pious cares
 " Are not forgot, nor fruitless are thy prayers ;
 " Propitious heav'n, thy virtuous deeds to crown,
 " Shall make thy barren womb conceive a son.
 " So spake the Seer ; and to compleat my joy,
 " As he had spok'd, I bore the promis'd boy.
 " But pleasures are imperfect here below,
 " Our sweetest joys are mix'd with bitter woe.
 " Ere twice four years were measur'd by my son,
 " So soon, alas ! the greatest blessing's gone.
 " The glowing roic was quickly seen to fade,
 " At once his beauty, and his life decay'd :
 " The beauteous child by death still vanquish'd lay,
 " Still death insulted o'er the beauteous prey ;
 " Till to the house the sacred Seer was come,
 " And with supernal pow'r approach'd the room.
 " By the dead child, awhile he pensive stood,
 " Then from the chamber put the mourning crowd :
 " That done, to God he made his ardent pray'r,
 " And breath'd upon the child with vital air,
 " And now the soul resumes her pristine seat,
 " And now the heart again begins to beat ;
 " Life's purple current o'er the body spreads,
 " While death, repuls'd, ingloriously recedes."

Endor, mentioned in 1 Samuel, xxviii. as a place of residence of a witch, or woman who had a familiar spirit, to whom Saul applied to raise the spirit of Samuel, was situated on the west of the river Jordan. Both Saint Jerom and Eusebius inform us, that in their days there was a considerable town of that name at about four miles to the southward of mount Tabor. The circumstance of Samuel's appearance to Saul, was certainly supernatural, and permitted by God for the wisest purposes ; and upon a most singular occasion. Nevertheless we should be cautious of straining so remarkable a text, to favour the superstitious notion of the power of witches, wizards, &c. and of the frequent appearance of apparitions upon the most trivial occasions. A learned divine, on occasion of repealing the act of parliament relative to witches, witchcraft, &c. in the year 1736, preached a sermon on the text in 1 Samuel, xxviii. 6, 7. in which he very humanely and justly observes, that the vulgar notions concerning witchcraft, and the affair of the witch of Endor, essentially differ ; and continues thus, " A magician in its best sense is a wife man, or wife woman ; and this is also the proper meaning of witch, and wizard, or rather wifard, that is, wit-ch and wi-fard, in our own language, being both derived from the old verb to wit or wif, that is, to know or understand ; and do therefore imply no more than a knowing or understanding person ; consequently witchcraft is the hidden art or mysterious practice of such a person ; and these words, I believe, were never used in a bad signification, till they were appropriated to such persons as pretended to know more than they really did, and by that means imposed upon the ignorance and weakness of others for the sake of gain ; this men did by various arts, which were therefore called magical, that is, crafty, subtil, mysterious contrivances, in order to amaze the people, and to make them believe strange things of them,

as if they could work wonders, and predict strange things : sometimes by the stars, and then they were called astrologers ; sometimes by consulting the entrails of sanctified beasts, and the flying or feeding of birds, and then they were called augurs or soothsayers ; sometimes by charms, that is by verses, spells, or love potions, and then they were called enchanters ; sometimes by throwing of dice, drawing lots, or sleight of hand tricks, and then they were called forcerers ; and sometimes by pretending to raise the dead, and to converse with them, and then they were called necromancers ; but magician was a common name to all these ; and so seem the scripture witch or wizard to have been, which are of the same import : but witchcraft now is seldom or never ascribed to wife or knowing people ; but to poor despicable ignorant creatures, who have neither sense enough to defend themselves, nor cunning to impose on others. It is not so much as pretended that they foretel any thing, or ever make themselves famous, or grow rich and great by the art of magic ; it is a mere relic of popery sunk deep into the minds of the ignorant and credulous, from which they are not yet purged. In that religion they have peculiar officers called exorcists, to cast out the devil, not only for the spiritual good of the possessed, but for their own temporal advantage ; and therefore it is no wonder if (in those days) they filled the world with spirits, and for that made them as familiar as they could do. It is no wonder if they made them as a witch, nor age nor wrinkles, nor yet a revengeful eye or malicious tongue ; but it is craft and cunning and imposture, let on foot to make a profit of, and practised to the detriment of truth and religion."

Indeed, so far back as the reign of queen Elizabeth, the frauds and impostures of pretended fortune-tellers and diviners were so well known, that an act of parliament was passed concerning them, which contained the following words, " Further it is enacted, that if any person by witchcraft or divination pretends to discover any hidden treasures of gold or silver, to tell where things lost or stolen may be found, to excite any unlawful affection, or to prejudice any body in person or goods, he shall suffer a year's imprisonment, and stand once a quarter in the pillory for the first offence, and for the second forfeit all his goods and chattels, and suffer imprisonment during life." Vide 5 Q. Eliz. c. 16.

A polite modern writer hath observed, that it is remarkable how much the belief of apparitions has less ground within the last fifty years ; which he very justly ascribes to the general encrease of knowledge, and consequent decay of superstition. " A belief of this kind," says he, " might spread in the days of popish infatuation ; a belief as much supported by ignorance, as the ghosts themselves were indebted to night." One of the principal arguments that hath been urged in favour of visionary appearances, is " that if there had been no real, there could have been no counterfeit shilling." But this the same author observes is a piece of sophistry ; for the simile of the true shilling must allude to the living person, and the counterfeit resemblance to the posthumous figure of him that either strikes our senses or our imagination.

There is another cause, which in our opinion, hath kept up the infatuation, since the time of the reformation. As our thoughts upon the subject are novel, they may be agreeable ; and as they are founded upon experience, we hope they are just ; we mean the number of apparitions and phantoms raised by dramatic writers ; for the principal ideas of the vulgar, relative to ghosts and apparitions, are drawn from what they have seen or heard in the play-house ; and the brilliant effusions of a poet's fancy have often worked upon a weak mind so far as to make it imagine an ideal subject a real object. We have no doubt but the following lines have raised innumerable visionary fears :

" Be thou a spirit of health, or goblin damn'd ?
 " Bring with thee airs from heaven or blasts from hell ?
 " Be thy intents wicked or charitable ?
 " Thou comest in such a questionable shape,
 " That I will speak to thee. Oh ! answer me ;
 " Let me not burst in ignorance, but tell

"Why thy canoniz'd bones, heart's dith,
 "Have burst their cearments? Why the sepulchre,
 "Wherein we saw thee quietly interr'd,
 "Has op'd its ponderous and marble jaws,
 "To give thee up again? What may this mean,
 "That thou, dear corse, again in complete steel,
 "Revisit'st thus the glimpses of the moon,
 "Making night hideous, and us fools of nature
 "So horribly to shake our disposition
 "With thoughts beyond the reaches of our souls?"

SHAKESPEARE'S Hamlet.

The following lines no doubt have supplied the timorous with many tremendous ideas:

"—— A spirit's force is wonderful,
 "At whose approach, when starting from his dungeon,
 "The earth will shake, and the old ocean groan;
 "Rocks are remov'd, and trees are conjur'd down,
 "And walls of brass and gates of adamant,
 "Are passable as air, and fleet like winds."

LEE'S Oedipus.

The poets have, however, made ample amends for what they may have contributed towards the continuance of a belief of the frequent appearance of apparitions, by the ridicule they have so pointedly and justly thrown upon astrologers and fortune-tellers: Sir Samuel Garth, in describing one of these pests of society, says,

"An inner room receives the num'rous shoals,
 "Of such as pay to be reputed fools;
 "The sage in velvet chair here lolls at ease,
 "To promise future health for present fees;
 "Then as from Tripod Iulem flames reveals,
 "And what the stars know nothing of foretels."

But perhaps the most pointed and humorous picture of these impostors is painted by the ingenious author of Hudibras in the following lines:

"They'll search a planet's house to know,
 "Who broke and robb'd a house below;
 "Examine Venus and the moon
 "Who stole a thimble, who a spoon;
 "And tho' they nothing will confess,
 "Yet by their very looks can guess,
 "And tell what guilty aspect bodes,
 "Who stole, and who receiv'd the goods;
 "They feel the pulses of the stars,
 "To find out agues, coughs, catarrhs;
 "What gains or loses, hangs, or faves,
 "What makes men great, what fools, what knaves;
 "But not what wife, for but of thole,
 "The stars they say cannot dispose."

Again of one in particular:

"He with the moon was more familiar
 "Than e'er was almanack well-willer:
 "Her secrets underflood to clear,
 "That some believ'd he had been there;
 "He made an instrument to know
 "If the moon shone at full or no."

The other half tribe of Manassah had Issachar on the north, Ephraim on the south, the Mediterranean on the west, and the Jordan on the east. It was a beautiful country, finely diversified with mountains, valleys, lawns, springs, &c. The most considerable place was Bethsan or Bethshan, situated on the west of Jordan and the south coast of the sea of Galilee: it was considerable in the time of St. Jerom and Eusebius; the Jews called it Bethsan, and the Greeks, Sythopolis, as it is likewise named in the scriptures; the Turks, however, call it Elbvan.

Another remarkable place is Salem, or Solyma, as Josephus calls it, and which is likewise called so by Mr. Pope, who, in his invocation at the beginning of that beautiful poem, the Messiah, says,

"Ye nymphs of Solyma begin the song,
 "To heavenly themes sublimer strains belong."

No traces at present are left of any of the other towns, and nothing worth relating is recorded of their ancient situation.

The lot of the tribe of Ephraim, afterwards known by the name of Samaria, had the Jordan on the east, the Mediterranean on the west, the tribe of Benjamin on the south, and the half tribe of Manassah on the north; it was here that the rupture between the kingdoms of Israel and Judah originated: the principal places were,

Sichem or Sechem, since Neapolis, once considerable, being a city of refuge, and after the destruction of Samaria, the capital of the revolted kingdom; on the place where it stood there is at present a town known by the name of Naplosa or Naplouse, between the mounts Ebal and Gerizim. It is the seat of a Turkish sangiac, and capital of a territory consisting of 100 villages. Mr. Maundrell informs us it is in a poor condition, compared with what its ancient ruins shew it to have been, consisting of only two streets lying parallel under Gerizim, but well built and full of people.

Arimathea, or Ramah in Hebrew, which signifies a high place, was the place of the prophet Samuel's nativity.

Samaria, anciently Someron, from the mountains on which it was built, but now Sebaste, was the capital of the revolted kingdom, and raised by its monarchs to great splendor; it was destroyed by the Assyrians, but Herod rebuilt it, and embellished it with many magnificent edifices, of which there are still some remains, particularly a large square piazza encompassed with marble pillars, some standing, others lying; the fragments of some strong walls, and the church built by the empress Helena over the place where John the Baptist was beheaded, or as some say, buried. The remains of this church are divided into two parts, one of which belongs to the Christians and one to the Turks; the latter division is paved with marble, and has a chapel under ground, to which there are 23 steps to descend; there are three tombs in it, where it is affirmed the Baptist, Elitha and Obadiah are buried. The Turks likewise say, that it was in this chapel Saint John was imprisoned and beheaded; for a trifle of money they let Christians down to see the tombs, or rather to peep at them through some openings in the wall. Not far from these ruins Jacob's Well is shewn, where Christ held the conference with the Samaritan woman; it is covered by a stone vault, and those who are desirous of seeing it are obliged to be let down through a narrow hole, when they may discover the mouth of it: it is hewn out of the solid rock, is three yards in diameter, and 35 in depth, five of which are filled with water.

Shiloh, or Sio, was celebrated for the tabernacle in which the ark was kept, till just before the death of Eli, vide 1 Sam. iv. 3. &c. at present there is nothing remaining of it.

Judea, properly so called, contained the tribes of Benjamin, Judah, Dan, and Simeon, and lay to the southward of the whole country.

The lot of the tribe of Benjamin had Samaria on the north, Jordan on the east, and Dan on the west: the principal places are,

The justly-famed city of Jerusalem, the capital of Judea, the regal seat of the Jewish monarchs, and the center of the Jewish religion. In its most flourishing state, this city was divided into four distinct parts, each being inclosed by its own walls, viz. 1. The old city of Jebus, which stood on Mount Zion, or Sion, where the prophets dwelt, and where king David built a superb palace, which became the residence both of himself and his successors; on which account it was called the CITY OF DAVID. 2. The Lower City, or the Daughter of Zion, so called on account of its having been built subsequent to the other. In this division stood the two magnificent palaces which Solomon built for himself and his queen; the fine palace of the Maccabean princes; the noble amphitheatre erected by Herod, which was said to be capable of containing 80,000 spectators: the citadel built by Antiochus, which was destroyed by Simon the Maccabee; and the second citadel called Antonia, which was erected by Herod.

Herod upon a craggy rock. 3. The New City, principally inhabited by merchants, artificers, mechanics, &c. and 4. Mount Moriah, on which the temple of Solomon was built, of which an ample description is given in the 6th and 7th chapters of the first book of Kings.

Jerusalem is at present about three miles in circumference, and lies in 31 deg. 50 min. north lat. and 36 deg. east long. being situated on a rocky mountain. Dr. Shaw says, "The hills which stand about Jerusalem make it appear to be situated, as it were, in an amphitheatre, whose arena inclineth to the eastward. We have no where, as I know of, any distinct view of it: that from the Mount of Olives, which is the least, and perhaps the farthest, is notwithstanding at so small a distance, that when our Saviour was there, he might be said, almost in a literal sense, "to have wept over it." There are very few remains of the city, either as it was in our Saviour's time, or as it was afterwards rebuilt by Hadrian, scarce one stone being left upon another; even the very situation is altered; for Mount Zion, the most eminent part of the Old Jerusalem, is now excluded, and its ditches filled up; whilst the places adjoining to Mount Calvary, where Christ is said to have suffered without the gate, are now almost in the center of the city." With respect to its present state, the Turks call it Cudfenbaric: it is thinly inhabited; the walls are weak, and without battions; the ditch inconsiderable; the gates are six in number, viz. Damascus, St. Stephen's, Herod's, Sterquilina, Bethlehem, and Mount Zion gate; beside the Golden Gate, which is shut up, on account of a prophecy which the Turks have among them, that by that gate the Christians are to take Jerusalem. The streets are narrow, and the houses mean. Pilgrims and travellers, who flock from all parts either through devotion or out of curiosity, are the principal support of the city. A Turkish basha resides here, to keep good order, collect the Grand Seignior's revenues, and protect the pilgrims from the insults of the Arabs.

No European Christian is permitted to enter the city till the requisite duties are discharged; nor can a stranger safely stay here, without being upon good terms with the Latin fathers.

The pilgrims principal object is the church of the Holy Sepulchre, situated upon Mount Calvary. It is 100 paces in length, and 60 in breadth: the workmen were obliged to reduce the hill to a plain area, in order to lay the foundation; but great precaution was used not to alter any part of it, where our Saviour's Passion was concerned. The scene of the Crucifixion is left entire, being about 12 yards square, and stands at this day 60 much higher than the floor of the church, that it is ascended to by 21 steps. The Holy Sepulchre, which was originally a cave hewn out in the bottom of the rock, may be now compared to a grotto standing above ground, and having the rock cut away, and levelled all round. The walls of the church of the Holy Sepulchre are of stone, and the roof of cedar; the east end incloses Mount Calvary, and the west the Holy Sepulchre; the former is covered with a superb cupola, supported by 16 large columns, and open at top. Over the altar there is another fine dome; the nave constitutes the choir, and the aisle of the church contain the most remarkable places where the circumstances of our Saviour's Passion were transacted, together with the tombs of Godfrey and Baldwin, the two first Christian kings of Jerusalem. In the church of the Crucifixion, the hole is shewn in which it is said the cross was fixed. The altar has three crosses richly adorned on it, particularly with four lamps of immense value, which are kept constantly burning. The cloister round the sepulchre is divided into sundry chapels. The Latins, who take care of the church, have apartments on the north west side, but they are never suffered to go out, the Turks keeping the keys, and furnishing them with provisions through a wicket. Some grand ceremonies are performed at Easter, representing Christ's passion, crucifixion, death, and resurrection, of which take the following authentic account:

At dusk the pilgrims and monks meet in the chapel of the apparition; the lights are extinguished, and a sermon preached by one of the Latin priests; then each

being furnished with a lighted taper, all walk in procession round the church. They stop first at the Pillar of Flagellation, where a hymn is sung, and a sermon preached: thence they proceed to the Chapel of the Prison, to hear another hymn and another sermon: at the chapel of the Division of the Garment, to which they go next, a hymn is sung, but no sermon preached. They then proceed to the Chapel of Derision, the altar of which is supported by two pillars, and underneath is a piece of greyish marble, on which they say the soldiers placed Christ, when they crowned him with thorns, and mocked him, saying, "Hail, king of the Jews!" Here a sermon is preached, and a fourth hymn is sung. They next enter another chapel, parted from the former only by a curtain, and advancing to the east end, come to the very spot on which our Redeemer was crucified. This chapel is covered all over with Mosaic work; and in the middle of the pavement, are some marble stones of several colours, designed to shew the very place where our Lord's blood fell, when his hands and feet were pierced: it is adorned with 13 lamps, and a candlestick with 12 branches. An hymn is here sung, and a sermon preached on some text relative to the passion: then two friars, who personate Joseph of Arimathea and Nicodemus, come with great solemnity to the cross, and take down the image that resembles Christ, which they put in a winding sheet, carry it to the stone of unction, and sing an hymn over it: a sermon is then preached in Arabic, and thus the ceremonials conclude.

On Mount Moriah, in the fourth part of the city, stands the edifice called Solomon's Temple, which is situated upon the same spot as the ancient temple; but it is uncertain by whom it was erected. The middle part, where the Jewish Sanctum Sanctorum was supposed to have stood, is converted into a Turkish mosque.

It is to be observed, that the Turkish sangac who governs this city, resides in the very house where Pontius Pilate is supposed to have formerly lived. The principal part of the churches have been converted into mosques. The priests and other Christians are kept miserably poor by the tyranny of the government, and have scarce any subsistence but what they procure by accommodating strangers with food and lodging, and selling them relics. In the neighbourhood of Jerusalem, the most remarkable antiquities are,

The pools of Bethesda and Gihon; the former is 120 paces long, 40 broad, and eight deep: it is at present dry, and the arches dammed up; but Gihon, which is about a quarter of a mile from Bethlehem gate, is a magnificent relic, 106 paces long, 60 broad, lined with a wall and plaister, and still well stored with water.

The tomb of the Virgin Mary, in the valley of Jehoshaphat, has a descent to it by a flight of 47 magnificent steps. On the right hand is the sepulchre of St. Anne, the mother of the Blessed Virgin; and on the left hand is that of Joseph her husband; the whole is cut into the solid rock.

Abraham's pillar or place, which it is said was erected by that prince, in order to perpetuate his memory, as he had no male issue, resembles a sepulchre, though it is not known that he was buried there. There is a great heap of stones about it, which are always increasing; for all Jews and Turks, who pass by it, make a point of throwing a stone each upon the heap, as a token of abhorrence to Abraham for his unnatural rebellion against his father. The structure itself is 20 cubits square, and 60 high, adorned below with four columns of the Ionic order. From the height of 20 to 40 cubits it grows less, and is plain, a small fillet at the upper end excepted: from thence to the top it is circular, and runs up spirally to a point, the whole being cut out of a solid rock: there is a room within considerably higher than the level of the ground without, on the sides of which are niches, probably to receive coffins.

To the eastward of the above is the tomb of Zechariah, the son of Barachiah, whom the Jews slew between the temple and the altar, as it is commonly supposed. It is cut out of the rock, 18 feet high, as many square, and adorned with Ionic columns on each side,

cut out of the same rock, and supporting a cornice: the whole ends in a pointed top like a diamond.

The royal sepulchres without the walls of Jerusalem are some of the most elaborate, curious, and magnificent antique remains that imagination can conceive. By whom they were built is uncertain, but they consist of a great number of apartments, most of which are spacious, all cut out of the marble rock.

Near Jerusalem is a spot of ground, of 30 yards long, and 50 broad, which is now the burial place of the Armenians. It was formerly the aceldama, field of blood, or potter's field, purchased with the price of Judas's treason, as a place of interment for strangers. It is walled round, to prevent the Turks from abusing the bones of the Christians; but one half of it is occupied by a charnel house.

At Bethany, which stood in the road between Jerusalem and Jericho, the remains of an old castle are shewn, which it is affirmed belonged formerly to Lazarus: there is a descent of 25 steps to the room where he was laid, and the tomb out of which he was raised.

Jericho is reduced from a magnificent city to a little mean village, without any vestiges of its former splendor, except some grand arches of an old conduit. It is about 23 miles from Jerusalem, and was remarkable for being the first city invaded by the Israelites after their passage over Jordan, when it was taken by the singular fall of its walls.

The lot of the tribe of Judah was bounded on the south by the mountains of Edom; on the north by Benjamin; on the east by the Dead Sea; and on the west by the Mediterranean. This was the most fertile, populous, and largest of all the 12 lots, but at present there are no remains of any places which it might formerly contain, except

Bethlehem, the place of JESUS CHRIST's nativity; and therefore the most worthy to be held in esteem by all mankind, for the blessings brought by the Redeemer, agreeable to the prophecy of Isaiah; which prophecy is thus paraphrased by Mr. Pope:

"Wrapt into future times, the bard begun;
"A virgin shall conceive, a virgin bear a son.
"From Jesse's root behold a branch arise,
"Whose sacred flower with fragrance fills the skies:
"Th' ethereal spirit o'er the leaves shall move,
"And on its top defend the mystic dove.
"Ye Heavens from high the dewy nectar pour,
"And in soft silence shed the kindly show'r;
"The sick and weak the healing plant shall aid,
"From storms a shelter, and from heat a shade:
"Truth o'er the world her olive branch extend,
"And white-robb'd innocence from heav'n descend.
"Swift fly the years, and rise the expected morn;
"O spring to light! auspicious babe be born.
"Hark, a glad voice the lonely desert cheers;
"Prepare the way, a God, a God appears!
"A G. D.—a God the vocal hills reply;
"The rocks proclaim th' approaching deity:
"Lo! earth receives him from the bending skies;
"Sink down ye mountains, and ye valleys rise:
"With heads reclin'd, ye cedars, homage pay;
"Be smooth ye rocks, ye rapid floods give way:
"The Saviour comes, by ancient bards foretold;
"Hear him ye deaf, and all ye blind behold.
"He from thick films shall purge the visual ray,
"And on the sightless eye-balls pour the day;
"Tis he th' obstructed paths of sound shall clear,
"And bid new music charm the unfolding ear.
"The dumb shall sing, the lame his crutch forego,
"And leap exulting, like the bounding roe:
"No sigh, no murmur the sad world shall hear,
"From ev'ry eye, he wipes off ev'ry tear.
"In adamant chains shall death be bound,
"And hell's grim tyrant feel th' eternal wound.

This city is distant between six and seven miles from Jerusalem, to the south west in the way to Hebron: it lies in north lat. 31 deg. 35 min. and in 65 deg. 50 min. long. Anciently it was called the City of David, having been the birth-place of the royal psalmist. It was

otherwise called Ephrath or Ephratah: see Genesis xxxv. 19. It was originally built by the Jebusites, and both Jerom and Eusebius assure us, that the monument of Jesse, the father of David, was here shewn in their time. Bethlehem is seated on a pleasant hill, in a fine fertile plain, and enjoys a most excellent air. It contains a convent of the Latins, another of the Greeks, and another of the Armenians, and is annually resorted to by a great number of pilgrims and travellers. All the convents have doors which open into the chapel of the holy manger: for the place where the blessed redeemer was born, and the manger in which he was laid, are shewn to this day. The manger is adorned with three pillars, one in the middle, and the others at the ends; in the angle, a step lower, are two other small pillars of an equal bigness, between which there is a marble manger big enough to hold a new born infant; and opposite to it is a stone, whereon the Blessed Virgin sat when the wife men came to adore the heavenly infant: the whole is become entirely black through time. At the distance of about 40 yards from one of the convents, there is a grot hollowed in a chalky rock, where tradition says the Blessed Virgin hid herself and her divine babe from the malice of Herod, some time previous to her departure into Egypt: eastward, at the distance of about half a mile, the pilgrims are shewn the field where the shepherds were watching their flocks when they received the glad tidings of the birth of a blessed Redeemer. The magnificent church built over the grot where the divine infant was born, is one of the most superb in the east, being divided into five isles, formed by four rows of elegant marble pillars, to the amount of 40 in number, that is, ten in a row; besides these, 10 more support the whole choir, which is inclosed by a wall; the pavement is beautiful, and the cedar roof proportionably high. The noble portico by which you enter the church, is supported by 16 handsome marble pillars; the choir, which is covered by a noble cupola, terminates in a semicircle that contains the altar: not far from which are two marble stair-cases, consisting of 13 steps each; by one of these the pilgrims descend to the chapel of the nativity, where there is an altar under a concave with a representation of the nativity, the whole being illuminated by lamps continually kept burning. This magnificent edifice was built by the pious empress Helena, in commemoration of the birth of Christ. At a small distance to the southward of Bethlehem, the famous fountains, pools, and gardens of Solomon are shewn. The pools are three in number, lying in a row, and so disposed, that the waters of the uppermost fall into the second, and those of the second into the third. They are of a quadrangular figure, equal in breadth, but differing in length; the breadth of each being 450 feet, but the length of the first is 800 feet, of the second 1000 feet, and of the third 1100 feet: they are very deep, and lined with a plastered wall. Close to the pools is a pleasant castle of a modern structure; and at about the distance of 700 feet is a fountain, from which they receive their waters. On the westward of the city the wall of David is shewn, for the waters of which that monarch so passionately longed, according to the inspired writer, 2 Samuel, chapter xxiii. 14, &c. "And David was then in the hold, and the garrison of the Philistines was then in Bethchem; and David longed, and said, O that one would give me drink of the water of the well of Bethlehem, which is by the gate. And three mighty men broke through the host of the Philistines, and drew water out of the well of Bethlehem, that was by the gate." About two furlongs from this well, are the remains of an old aqueduct, which anciently conveyed the waters of Solomon's pools to Jerusalem. Besides the above-mentioned chapels in Bethlehem, are the chapel of Saint Joseph, the husband of the holy virgin, the chapel of the innocents, those of Saint Jerom, Saint Paula, and Eustochium. It is proper here to observe that Saint Jerom was a learned and celebrated writer in the fourth century; that Paula, and Eustochium her daughter, were two Roman ladies, instructed by Saint Jerom in learning and piety. This celebrated city is, however, at present reduced to a mean village, thinly inhabited by very poor people.

Hebron,

Hebron, the ancient seat of David before he took Jerusalem, hath long since been ruined; near it stands the village called Elkahil, on a pleasant hill that overlooks a most delicious valley. Ruinous as its present condition is, it still contains a handsome church, built by the empress Helena over the sepulchral cave, where Abraham and Sarah, Isaac, Jacob and Leah lie buried. The Turks have since turned the church into a mosque; but Turks, Christians, and Jews, all regard it with equal veneration. This town is the capital of a district, consisting of about 24 little villages, which the Turks call the Territory of the Friends of God.

Bethoor, or Bethora, formerly a very strong fortress, is supposed to have stood upon a craggy hill, 20 miles to the southward of Jerusalem, where there is now a village named Saint Philip; from a tradition that it was at a fountain near this place where Saint Philip baptized the Eunuch of Queen Candace.

Engaddi, a village on the top of a rock near the Dead Sea, about four miles east of Tekoa, is famed for the great quantity of palms, and other odoriferous trees, which grow on the mountains above it. Among the caverns of these mountains, two are very remarkable, the one for being the retreat of Lot and his daughters after the conflagration of Sodom; and the other for being the cavern in which David so generously spared the life of Saul, contenting himself with only cutting off the skirt of his garment.

The lot of Dan was bounded on the south by Simeon, on the north by Ephraim, on the east by Judah and Benjamin, and on the west by the Philistines country and the Mediterranean; the length being 40 miles from north to south, and the greatest breadth not exceeding 25 miles. It abounded in all the necessities and luxuries of life; and from hence the spies brought such noble specimens of its admirable fertility to the Israelitish camp.

The tribe of Simeon, which was bounded by Dan on the north, by the river Tabor on the south, by Judah on the east, and a neck of land towards the Mediterranean on the west, lay in the most southern corner of Judea. This part was not so fertile as the rest of the land of Canaan, nor were the towns either many or considerable, none deserving any mention, even in ancient times, except Anthedon and Rhinocolura, which are now poor ruined towns standing on the sea coast, and BeerSheba, of which, in Gen. xxi. we learn that Abraham having entered into a solemn league of friendship with Abimelech, king of the Philistines, to secure his property in a well against the outrage of the Philistines, who had taken seven wells from him before, presented the king with seven young sheep, and entreated him to accept of them as a token that he had dug such a well, and should thenceforth be permitted peaceably to enjoy it; upon which occasion the place was called BeerSheba, or the Well of the Oath, because of the covenant made relative thereto. Hence the city which was erected near it, in process of time, obtained the name of BeerSheba.

A small part of the present Palestine, situated on the coast of the Mediterranean, and extending from the seaport of Jamnia to the mouth of the river Bezor, was long subject to the five lords of the Philistines; the principal places were,

Afcalon, which is dwindled into a very trifling village, stands on the sea coast, and was the native place of Herod the Great, who was thence called Afcalonites. It was an episcopal see from the earliest ages of christianity; and during the holy wars had many stately edifices remaining, which have since been all ruined by the Turks and Saracens.

Gaza stands between two and three miles from the Mediterranean sea, and lies in 31 deg. 22 min. north lat. and 33 deg. east lon. It retains many monuments of its pristine grandeur, and on all sides some noble remains of antiquity are to be seen, viz. several rows of stately marble columns with all their ornaments entire, magnificent sepulchres, monuments, &c. Among these is one in particular surrounded by a high wall, which belongs to a Turkish family. Near the city stands a round castle, flanked with four square towers,

defended by two strong iron gates and other works, opposite to which is the fraglia, where the beila's wives and attendants are kept; and a little above are the remnants of an old Roman castle, the materials of which are so firm that the hammer can make no impression on them. The Greeks and Armenians have each a church here; and near to that of the latter, the spot is shown where the temple stood which Samson pulled down over his head, and destroyed at once his self and a great number of Philistines. The castle is the residence of a fargiac, who is supposed to have near 300 small villages or hamlets within his jurisdiction. At a little distance from the town, quite up to Egypt, the country is inhabited by a race of wild Arabs, who are continually roving about, not being subject to any regular government.

Massina, or New Gaza, was the ancient sea-port to the former, or Old Gaza, and on that account only was of note; it stood about 10 miles from Afcalon, near the mouth of the river Bezor; about it are still some antique remains, but whether they belong to New or Old Gaza is uncertain.

About three miles south from Gaza, and two miles from the sea, stands a town named Larissa; it is at present a poor mean place, defended by an old castle, and a garrison of 200 men; but was formerly celebrated as the burial-place of Pompey the Great, who was killed in its neighbourhood.

At a little distance from the above stands Raphia, which is now so inconsiderable as scarce to deserve mentioning; it was, however, a place of some account in the time of the Maccabees.

Gath was anciently the principal of the five capital cities of the Philistines, being the regal seat; but it dwindled away so early, that no vestiges of it are now remaining, and it is even uncertain where it exactly stood. It was famed as the residence of the remnant of the giant race, and was the place of Goliath's nativity.

Eckron, or Ecron, was the northernmost of all the five cities which gave name to the five lordships of the Philistines; it was once a place of great wealth and power, and frequently mentioned in the sacred writings, but it is dwindled to nothing, and not noticed by any profane authors.

Afhdod, or Azotus, which was situated about 12 miles to the north of Afcalon, bore an extraordinary fame among the ancients. The situation was inland, and the circumjacent country exceedingly fertile and pleasant. It was formed for the temple of Dagon, where was the grandest and most favoured god the Philistines had. To him they attributed the invention of agriculture. Our immortal Milton thus describes this pretended deity:

“Next came one
“Who mourn'd in earnest, when the captive ark
“Maim'd his brute image, head and hands kept off
“In his own temple, on the grunfel edge,
“Where he fell flat, and sham'd his worshippers;
“Dagon his name; sea-monster, upward man
“And downward fish, yet had his temple high
“Rear'd in Azotus.”

Though some controvert this opinion, and insist that the idol Dagon was represented exactly like a man, and not like a monster. This city, in the times of primitive christianity, was an episcopal see, and was even a fair village in the time of St. Jerome, but at present no traces of it are left.

Thus have we minutely described the HOLY LAND, and amply dwelt upon many curious and interesting particulars; but we would earnestly recommend to our readers to compare our geographical account of the various parts of Syria, with the passages in which they are mentioned in the sacred writings, when we have no doubt but they will receive infinite satisfaction from the comparison.

“Charm us, ye sacred leaves, with nobler themes,
“With op'ning heav'ns, and angels rob'd in flames;”

Ye

"Ye restless passions, while we read, be aw'd;
 "Hail, ye mysterious oracles of God!
 "Here we behold how infant time began,
 "How the dust mov'd, and quicken'd into man;
 "Here, thro' the flow'ry walks of Eden rove,
 "Court the soft breeze, or range the spicy grove;
 "There tread on hallow'd ground, where angels trod,
 "And rev'rend patriarchs talk'd as friends with God;
 "Or hear the voice to slumbering prophets giv'n,
 "Or gaze on visions from the throne of heav'n."

BROOME.

It would in this place be unpardonable to omit giving the principal traits in the life of our Lord and Saviour JESUS CHRIST: a concise history of the Blessed Redeemer shall therefore be the subject of the ensuing section.

S E C T. XIX.

The Life of our Blessed Lord and Saviour JESUS CHRIST.

THE Temple of Janus* was shut; the sceptre had departed from Judah†; and the prophecy of Daniel was accomplished‡; when God, out of his compassion towards mankind, sent his son into the world, to take off that guilt of sin which defiled our nature; and the great work of our salvation was thus accomplished.

In the time of Herod, God sent the angel Gabriel to a holy virgin, named Mary, who was espoused to Joseph at Nazareth, a city at Galilee, to inform her how highly favoured she was of God. The consummation of marriage between Joseph and Mary had not taken place, as was the custom not only among the Jews, but with many nations of the east; the parties being often contracted in their infancy, but not permitted to cohabit together, till after they had been several years betrothed. Mary, however, conceived by means of the Holy Spirit, and God sent an angel to Joseph, to convince him of the chastity of his spouse, and the divinity of her son.

During her pregnancy, she travelled to Bethlehem with her husband Joseph, in order to be taxed, agreeable to a decree issued by Augustus Cæsar for a general capitation tax. The city was so crowded, that not being able to find any room in an inn, they were under the necessity of retiring to a stable, where the Holy Virgin humbly bowed her knees, and brought her first-born into the world at the expiration of nine months. The conception being without sin, the production was without pain, and notice was given to the world of the nativity of a REDEEMER, by an angel and a star. The angel appeared to the Jewish shepherds, and the star was seen by the Magi, or wise men of the east. At the expiration of eight days, the blessed infant was circumcised; and thus, by a few drops, gave earnest of the abundance of blood which he was to shed for the purification of mankind.

In due season the Holy Virgin presented the Divine Infant in the temple, and redeemed him, according to the written law, with five shekels, and a pair of turtle doves; for Christ did not come into the world to overturn, but to fulfil the law. At this critical instant,

* Janus, the first king of Italy, was deified at his death, and depicted with two faces: the temple dedicated to him at Rome was always kept shut in the time of peace, and open in the time of war. It was therefore natural that the Saviour of Mankind, who brought eternal peace and salvation into the world, should be born in a time of general tranquillity.

† Jacob, on his death-bed, thus prophesied, Gen. xlix. 10. "The sceptre shall not depart from Judah, nor a law-giver from between his feet, until Shiloh come; and unto him shall the gathering of the people be." This prophecy was accomplished in the most literal manner; for about the very time in which Christ was born, the Romans deprived the Jews of all regal authority, and appointed magistrates of their own to administer justice throughout all Syria. Thus did the sceptre depart from Judah, nor were the Jewish law-givers suffered to retain any authority. The latter part of the prophecy was equally accomplished; for although there are many flourishing nations of Christians, the Jews are no longer a people.

Simeon and Anna, two pious persons, entered the temple, being stimulated by a divine impulse, when they joined with great fervency in praising God for having sent a Redeemer into the world. Simeon, in particular, begged to die, in the words of the celebrated canticle used in the liturgy of the church, and taken from Luke ii. 29, "Lord, now lettest thou thy servant depart in peace, according to thy word; for mine eyes have seen thy salvation."

Herod being informed of the birth of the child, tried, by many artifices, to get him into his power; but Joseph, being informed of his bloody intention, had the precaution to withdraw privately into Egypt with his wife, and the holy infant, where they remained twelve years.

On their return, Jesus, though so young, disputed with the most learned doctors in the temple, and soon after departed for Jordan, where he was baptized by John; when the heavens immediately opened, the Holy Ghost descended upon him in the form of a dove, and a voice was heard to pronounce these words, "This is my beloved son, in whom I am well pleased."

Jesus then remained in the wilderness 40 days, and 40 nights, without breaking his fast; at the expiration of which, the devil tempted him to eat bread of his own providing; but Jesus answered, "Man liveth not by bread alone, but by every word that proceeds from the mouth of God." The tempter then required a demonstration of his being God, by persuading him to throw himself from the battlements of the temple. Failing likewise in this attempt, he took him to the top of a high mountain, shewed him the glories of the world, and offered them to him, if he would fall down and worship him. This excited the indignation of Jesus so much, that he ordered him to depart.

Soon after he wrought his first miracle at Cana in Galilee; he then cleansed the temple of merchants, money-changers, &c. foretold his own resurrection, and convinced Nicodemus, a doctor of law, of his divine mission.

He then traversed Judea with his disciples, baptized great numbers, and repaired towards Galilee, where John was in confinement for having, in one of his sermons, reprehended Herod for his incestuous marriage with his brother's wife. By the way he conversed with the Good Samaritan, and restored the dead child of a nobleman to life.

He now travelled throughout Galilee, healing all manner of diseases, restoring the blind and lame to their sight and limbs, cleansing lepers, and doing all manner of benevolent actions. Near the lake Genazereth, being pressed by the crowd of people, he entered into Simon's ship, where he preached, and commanded the miraculous draught of fishes.

At the pool of Bethesda, he, on a Sabbath, cured a poor paralytic man, who had been lame 38 years, bidding him, "Take up his bed and walk." The Jews exclaimed against the breach of the Sabbath, but our Saviour soon convinced them, that a work of necessity ought to supersede a ritual command.

Jesus soon after returned to Galilee, and cured a man whose right hand was shrunk up, and withered. He now selected his twelve apostles, to whom, and a great

‡ The prophet Daniel says, chap. ix. 24. "Seventy weeks are determined upon thy people." Verse 25. "From the going forth of the commandment to restore and to build Jerusalem unto the Messiah the prince, shall be seven weeks; and threescore and two weeks, the streets shall be built again, and the wall even in troublous times." Ver. 26. "And after threescore and two weeks shall Messiah be cut off, but not for himself; and the people of the prince that shall come, shall destroy the city, and the sanctuary, and the end thereof shall be with a flood." The seventy weeks of Daniel contain the space of time between the second year of Darius Nothus, king of Persia, and the destruction of Jerusalem by Vespasian, about 42 years after the death of Christ.

The whole number of years are 490, as will appear by dividing that number by seven, which will give seventy, the number of weeks mentioned in the prophecy; for in this, as well as all other scripture prophecies, a day signifies a year, and a week seven years.

K k

multitude

multitude of people, he preached that admirable discourse called the *Sermon upon the Mount*, which comprises all the great principles of the Christian religion. On the descent from the mountain he healed a leper, and in returning to Capernaum, cured a favourite servant of a Roman centurion. At the gate of Nain, he brought to life a widow's son, as the people were carrying him to be buried; then dined with Simon the Pharisee, and consoled the penitent prostitute. In various parts of Galilee he continued comforting the afflicted, healing the diseased, and instructing the ignorant by the most expressive parables, 'till he crossed the sea of Galilee, when a terrible storm arising while he was asleep in the ship, his disciples awaked him, when he rebuked the waves, and restored the sea to a perfect calm; landing at Trachonitis, he met two demoniacs, from whom he cast out the devils that possessed them, who entered into a herd of swine, and occasioned those animals to precipitate themselves into the sea.

He soon after performed two remarkable miracles; the first was feeding the multitude in the desert with five barley loaves, and two fishes; and the second was walking on the surface of the water, with Peter, to the ship in which were his other disciples.

After performing many other miracles, and explaining his mission more fully to his disciples, Jesus at length, at the time of the Passover, eat the Paschal Lamb with his disciples, washed their feet, and informed them, that one of them should betray him. Judas soon after left them, though it was night; and then Jesus preached his farewell sermon to his remaining disciples, in which he recommended social love and unanimity, and foretold that Peter should deny him. A multitude of armed men then surrounded him, and Judas killed him, in order to distinguish, and thereby betray him. In the scuffle, Peter cut off the ear of Malchus, the servant to the high priest; for which Jesus reproved him, and immediately healed the ear of Malchus by touching it.

When Jesus was led away, all his disciples fled, except Peter, who followed at a distance, and John having recovered his spirits, returned into the high priest's hall, where Jesus was brought before Annas, who, though prince of the sanhedrim, refused to judge him, but sent him bound to Caiaphas; thither Peter came, and was challenged three times by the servants to be a Galilean, and of the family of Jesus, which he three times denied, and forswore: 'till Jesus looking back, reminded him of his prediction; then the cock crew, and Peter, being sensible of his crime, went out, and wept bitterly.

In the morning the council was to assemble, and while Jesus was in custody, the Jews mocked him, covered his face, and having smote him, called upon him to tell who it was. The elders likewise did their endeavours to suborn false witnesses against him, but were not so successful as they expected in their infernal machinations.

The principal articles of accusation which their whole malice could invent, was only that he had said he would destroy the temple, and in three days build it up again. To this Jesus making no reply, Caiaphas assured him by the living God to say whether he was Christ the Son of God or no. To which he answered in the affirmative. Then Caiaphas accused him of blasphemy, and he was instantly condemned to death by Pontius Pilate the Roman governor, who, though conscious of his innocence, weakly yielded to the solicitations of the Jews, and delivered him up to the soldiers to be crucified; who first cruelly beat him, and spit in his face.

Jesus hearing the final sentence, brought in the silver which they had given him as a reward for his treachery, and throwing it among them, said, "I have betrayed the innocent blood." With the money they bought a field called the Potter's Field, to bury strangers; and Judas went out and hanged himself. It is likewise to be observed, that Pontius Pilate was soon after deposed by Vitellius the proconsul of Syria, on account of his great cruelties and extortions. He was afterwards banished to Vincennes, in Gaul, where he put a period to his miserable existence with his own hands.

Jesus, being arrayed in a kingly robe, with a reed in his hand for a sceptre, and a crown of thorns upon his head, was led to Golgotha, in Mount Calvary, and there crucified, with this inscription upon his head, **JESUS OF NAZARETH KING OF THE JEWS.**

* * * *Those who wish to see a more ample account of the Life of our Blessed Lord and Saviour Jesus Christ, may be fully justified by perusing the Rev. Dr. FLEETWOOD'S LIFE OF CHRIST, consisting of 25 Sixpenny numbers, each of which is adorned with a beautiful copper-plate, expressive of the most distinguished and striking Subjects.*

SECT. XX.

A compendious History of the Turks.

THE Turks, who were no more than Scythian shepherds, that used to ramble from one country to another with their flocks and herds, but resided chiefly north of the Palus-Mæotis and the Euxine seas, in the eight century travelled southward, and settled in Georgia, between the Euxine and the Caspian seas, where they continued about 200 years.

About the year of Christ 1000, they removed farther southward into Armenia, the name of which they changed for that of Taurcomania. They soon after subdued Bagdat, ravaged Persia, and made themselves masters of the northern provinces of Arabia; they were at this time all Pagans, but their leader Tangrospire thought proper to turn Mahometan through political motives, well knowing that a sovereign of a different religious persuasion is never agreeable to the generality of the people. The Turks then proceeded to invade the territories of the Grecian emperor in Asia Minor, where they conquered several cities, as the Saracens had done in Syria, Palestine, and Egypt.

The Christians being greatly oppressed, the emperor of Constantinople, who was then at the head of the Asiatic Christians, implored the assistance of the different sovereigns of Europe, in order to oppose both Turks and Saracens.

The pope interested himself in the affair, and the clergy in general did their endeavours to excite an emulation, by which the Holy Land might be rescued from the hands of the infidels.

All Europe took the alarm, and in the year of Christ 1096, the first crusade commenced, when an astonishing multitude, to the number of near 800,000, engaged in the enterprise, and proceeded towards Palestine; but, as they had not considered the length of the journey, nor how they were to subsist till they arrived in the enemies country, above half of them perished by the way, some being taken off by sickness, others by famine, and others by the sword, even in Christian countries through which they marched; for as they observed but little order, and committed many depredations, the natives were frequently obliged to stand upon the defensive, and repel force by force.

Many of those who arrived at Constantinople were cut to pieces on their landing; but these were indeed but a confused multitude without discipline or subordination to their leaders: the more regular troops followed, and proceeded with greater caution under the conduct of Godfrey of Boulogne, and other commanders celebrated for their military exploits; these arrived at Constantinople in tolerable order, but their numbers greatly surprised the Grecian emperor, who began to be more afraid of them than he had before been of the Infidels; and instead of joining his armies to them as he had previously promised, contrived by every sinister means to detain them. He durst not deny the shipping which he had promised to transport the troops, lest he should feel the resentment of the commanders, who had great reason to be displeased at his treacherous conduct.

On mustering the troops it appeared that the Christians had 100,000 horse, and near twice that number of foot. This vast army began its operations by besieging Nice in Bithynia, to relieve which, sultan Soliman marched, but was totally defeated, when the place surrendered, and was put into the Grecian emperor's hands, as had been previously agreed.

The Christians then proceeded towards Antioch, when

when sultan Soliman, at the head of 200,000 men, gave them battle, but was totally defeated. Antioch was soon after taken, but the Christian leaders did not think proper to put it into the hands of the emperor of Constantinople, as his perfidy had repeatedly disgusted them. They then marched to Jerusalem, which they invested with only 50,000 men, their numbers being so far reduced; and the garrison at the same time was more numerous than the besiegers. The arrival of a fleet of English, Norman, Fleming, and Genoese ships, however, gave new spirit to their operations, by bringing them a fresh supply of men. The outward wall was soon carried by storm, and the city itself was soon after taken sword in hand, when Godfrey of Boulogne was crowned king of Jerusalem. This sovereign soon subdued Ptolemais, Césarea, Antipatris, Aikalon, &c. but he died within a year after his coronation, and Baldwin of Brugenis succeeded him, A. D. 1100. In his reign the Christians took the city of Tyre, and obtained three victories over the Infidels; he then laid siege to the city of Damascus, but proved unsuccessful in his attempt; after reigning 30 years, he died, and was succeeded by Fulk, earl of Anjou, in the year 1131. In this reign the Christians began to quarrel among themselves; but Fulk, being killed by a fall from his horse, his eldest son was elected king in the year 1142, under the title of Baldwin the Second, but being then only 13 years of age, his mother was joined with him in the administration of public affairs.

The Christians, who had been in possession of the Holy Land and countries adjacent more than 40 years, had established four distinct kingdoms, viz.

1. The kingdom of Edessa, which comprehended the countries on the banks of the Euphrates. 2. The kingdom of Tripoli, which was near the sea-coast. 3. The kingdom of Antioch; and 4. The kingdom of Jerusalem.

Sanguin, sultan of Aleppo, and afterwards Noradin his son, took advantage of the continual discords among the Christians, and retook many of the conquered places, which occasioned the Christians again to call in the assistance of the European sovereigns. Upon which invitation, Conrad, emperor of Germany, at the head of 100,000 men, undertook the expedition; but the Grecian emperor, proving as great an enemy to him as the Infidels, he lost the greatest part of his army, and returned home greatly disappointed.

Saladin, sultan of Damascus, had great success against the Christians; and, in 1187, took Jerusalem; this engaged Frederic, emperor of Germany, in another crusade; but the Imperial forces, who were for some time successful, at length were visited by the plague, which destroyed the army. Richard the first of England, and Philip Augustus of France, were then stimulated by the pope to carry their arms into Palestine, which they did in 1190; but the two kings disagreeing, this, like the preceding enterprises, likewise failed.

In the year 1200, Constantinople was taken by the Latins, and Baldwin, earl of Flanders, being elected emperor thereof, soon after laid siege to Adrianople; but the Greeks inviting the Tartars to their assistance, the Christian army was defeated, and Baldwin himself taken prisoner. They cut off the hands and feet of the unhappy monarch, and left him to perish miserably in the field, where he died three days after, in the 33d year of his age, and 1st of his reign.

Henry, the brother of Baldwin, being then elected emperor of Constantinople, by the assistance of the king of Thessaly, drove the Tartars out of Thrace, and recovered all the places they had taken.

The sultan of Egypt was now the most formidable Mahometan power; therefore the Christians determined to invade Egypt, which they did under the conduct of Lewis, king of France, commonly called St. Lewis, who departed from Europe with a fleet of 1800 sail, containing an army of 60,000 men, including about 13,000 knights, English, French and Cypriots. The army landed near Damietta, which they entered without opposition, the Infidels having previously abandoned it. Lewis left his queen at Damietta with a considerable garrison, and began his march towards grand Cairo, at the head of 20,000 horse and 40,000 foot; but they

were so harassed by the Infidels, that they were above three months in advancing 40 miles. At length the Mahometans taking an advantage of the van of the Christian army's being separated from the main body, attacked the crusaders with great fury, totally defeated them, took the king of France prisoner, and all the troops who were not slain in the engagement. It was at first debated by the Mahometans, whether they should not cut the throats of all their prisoners; but avarice getting the better of revenge, they determined to spare them, in order to exact a large ransom for the recovery of their liberty. They therefore agreed to enfranchise the king of France, and the rest of the prisoners, upon the delivering up Damietta, and paying such an immense sum of money as almost drained France of its treasures.

About this time an army of Tartars, under the conduct of Haalon, came down like a torrent from the northward, and took Bagdad, Aleppo, Damascus, and Iconium. The sultan of Egypt at the same time invaded and took the principal places in Syria. This success of the Infidels occasioned another crusade to be undertaken in the year 1271, by prince Edward, afterwards Edward the first, king of England; he took Nazareth, and defeated the Turks in several engagements; but not being properly supported by other Christian princes, he returned to England, after having been a year and a half in Palestine; whereupon Elphis, sultan of Egypt, invaded Syria, took Tripoli, Tyre, Sidon, Berethus, and all the towns possessed by the Christians, except Ptolemais. A truce was however agreed upon for five years; but being broken by the Christians, the sultan of Egypt laid siege to Ptolemais, but dying before the place, his son Araphus took it by storm, and gave the plunder to his soldiers; after which the Christians were entirely expelled from Palestine, 102 years subsequent to the taking of Jerusalem.

But Cassanes the Tartar, who was sovereign of Persia, revenged the quarrel of the Christians, by falling upon the sultan of Egypt, defeating his armies, recovering most of the places in Syria and Palestine, which he had taken, and rebuilding the city of Jerusalem, which he did at the instigation of his queen, who was an Armenian Christian; he likewise offered to join the Christian princes and re-establish them in the Holy Land, but the principal sovereigns in Europe were unhappily engaged in war among themselves, and could not therefore spare any forces to send to Palestine; upon which, Cassanes retired into Persia, and the sultan of Egypt recovered all he had lost.

Upon the death of Aladin, the last prince of the Selzucian family, the Turkish lords divided the country among themselves, the principal of whom was Ottoman or Othman, the son of Erthogul.

The Christians of Bithynia, when the Turks were drove out of Persia by the Tartars, permitted their flocks and herds to graze upon their mountains; but the Turks, after having been here for some time, began to claim the place as a matter of right, and to dispute the possession of it with the Christian natives, which naturally led the latter to complain to the governors of the neighbouring Grecian castles, that those whom they had succoured, through compassion, wanted new to be their masters. The Grecian governors therefore assembled a body of forces in order to compel the Turks to acknowledge the sovereignty of the Grecian emperor, or to relinquish the place; but Ottoman, putting himself at the head of a body of troops, defeated the Christians, and took Cara Chisar, a fortress situated on the frontiers of Bithynia and Phrygia. He afterwards plundered all Bithynia, which so greatly alarmed the Christians, that they prevailed upon the governor of Belezugar to invite Ottoman to the solemnization of a wedding at his castle, that they might have an opportunity of taking him off. Ottoman, being apprized of the design, contrived to introduce a party of soldiers in disguise, who killed the governor and all his guests, and took possession of the castle. He then made himself master of many other places in Phrygia, and even laid siege to the city of Nice. The emperor of Constantinople sent an army to relieve the places, but it was defeated by Ottoman, who from this time, viz.

A. D.

A. D. 1306, took upon himself the title and state of sultan, and made Neapolis the seat of his government. The Christians invaded the territories of this new sovereign, but were defeated.

Ottoman, now growing old, constituted his son Orchanes generalissimo, who subdued all the remaining places in Bithynia and Phrygia, and succeeded his father, who died A. D. 1328, as sultan, or king.

Orchanes, having taken Abydos, at the entrance of the Hellespont, on the Asian shore, from thence transported his army into Europe, and took Gallipoli in 1338, which was the first town the Turks ever possessed in Europe.

At the death of Orchanes, which happened in 1359, his son Amurath succeeded him, who in the beginning of his reign was disturbed by a confederacy between the lesser Mahometan princes in Asia and the Christians; but suppressing these, he transported his army into Europe, where he took many places from the Grecian emperor, particularly Adrianople, which he subdued in 1362, and made the capital of all his Asiatic and European dominions. About this time the body of janissaries was established, for every fifth captive above 15 years of age, was by Amurath's order retained in his service and educated in the seraglio, when at a proper season those of the largest stature were to be selected for the sultan's guard.

Amurath returned into Asia to suppress an insurrection, when the Servians, Bulgarians, and Illyrians invaded his European dominions, but the emperor of Constantinople not joining them at this critical juncture, Amurath at the head of 200,000 men crossed the Bosphorus, and totally defeated them. Amurath, however, survived this victory but a short time; for a Christian soldier pretending to beg his life of him, took an opportunity of stabbing him with a dagger which he had concealed under his cloaths, of which wound the sultan immediately died, in the year 1373.

Amurath was succeeded by his son Bajazet, who, to have no rivals, began his reign by the murder of his brother. He then invaded Serbia, and laid siege to Crotava, which surrendered on condition that the garrison should have leave to march unmolested away, and join the Christian army. They were however no sooner out of the town, than Bajazet ordered a detachment of his troops to put them all to the sword, which bloody injunction was immediately executed.

The ensuing year the Turkish generals plundered the countries north of the Danube, while Bajazet himself, passing the Hellespont, took the city of Philadelphia in Syria; conquered Caramania, Ionia, and the coast of Natolia. The compliances which the Grecian emperor had shewn the Turks was not of any service to him; for Bajazet, unmindful of his obligations to that monarch, laid siege to Constantinople, which was so well defended, that he blockaded it for eight successive years, till Sigismund, king of Hungary, assisted by the French, compelled him to raise the siege; but Bajazet soon after defeated the Christian army, and took such a multitude of prisoners, that every Turkish soldier had a slave to his share: after this victory Bajazet again laid siege to Constantinople, but was obliged a second time to raise the siege on account of the approach of a vast army under the command of Tamerlane, commonly called the Great, who had been invited to march against Bajazet, not only by the emperor of Constantinople and other Christian princes, but by the Mahometans themselves, who were greatly oppressed by that tyrant.

Tamerlane marched first to Scythia, which he invested, and summoned to surrender; but the Turks trusting to the numerous garrison, and the strength of the place, treated the message with contempt. Tamerlane therefore began the siege, and having made a considerable breach by undermining the wall, he carried the place by storm.

Bajazet hearing of Tamerlane's success, marched at the head of an army consisting of 1,000,000 of soldiers, when a bloody battle was fought in the plains of Stella, in which the Turks were totally defeated, and Bajazet himself was taken prisoner.

Tamerlane at first treated his royal captive with great

humanity, but being provoked by his insolence, he confined him in an iron cage, and carried him with him wherever he went; the haughty Turk, not being able to endure this ignominious kind of punishment, dashed his brains out against the bars of his moveable prison.

Tamerlane soon after subdued the greatest part of Lesser Asia, took the city of Persia in Bithynia, conquered Syria, subjugated Egypt, and returning back to his own country, died A. D. 1404.

Bajazet's five sons then disputed for the sovereignty of the Ottoman empire for ten years; Solyman the eldest reigned for a short time, but at length Mahomet the youngest, proving successful, was unanimously acknowledged sole sovereign of the Turkish dominions: having rendered Walachia and Transylvania tributary to him, he died in the year 1422, and was succeeded by his son Amurath, commonly called Amurath the Second. This prince, after suppressing several domestic insurrections, subdued great part of Greece, recovered Serbia and Caramania, and then invaded Hungary with an army of 80,000 men; but was repulsed by the prince of Transylvania, who being joined by the king of Poland, passed the Danube, drove the Turks out of Serbia, and advanced to mount Hemus; the passes of the mountains were, however, so well guarded, that the Christians, not being able to penetrate into Romania, were obliged to retreat; the Turks pursued them, and coming up with their rear, a general battle ensued, when the Christians obtained a complete victory. It was during this engagement that the celebrated Scanderbeg, who commanded a body of Turkish troops, deserted to the Christian army. This prince was the son of John Castriot, prince of Epirus, whose territories Amurath invaded, and compelled him to deliver up his four sons as hostages for his fidelity: Amurath then ordered all the young princes to be circumcised and instructed in the Mahometan superstition; and, on the death of their father, seized the country of Epirus as his own, after putting to death the three elder princes. He however intended to have a great regard for the younger, on whom he conferred the title of Scanderbeg, which signifies Lord Alexander, *Scander* implying in the Turkish language Alexander, and *beg* being the titular appellation for lord. The Turk's pretended kindness could not however efface from the young prince's bosom the sense of the wrongs he and his family had sustained from the infidel: he was a Christian in his heart, and long meditated to escape from the Mahometan. The above mentioned battle presented him with an opportunity, when he not only enticed 3000 soldiers, who were natives of his own country Epirus, to desert with him, but brought off the Ottoman secretary of war. He afterwards proceeded towards Croia, the capital of Epirus, and compelled the secretary to write an order to the name of the basha his master to the governor, commanding him to deliver up that city to the care of Scanderbeg: the governor not suspecting but what the order really came from the basha, and was written with the concurrence of Amurath, delivered up the place without hesitation. Scanderbeg, being joined by the inhabitants, immediately put all the Turks in the place, who refused to turn Christians, to the sword; and having assembled an army of 12,000 men, he marched to Petrella, which surrendered upon the first summons; and Stellusa followed the example, which success gave him encouragement to invade Macedonia, and lay it under vast contributions, raising by this means a sufficient sum of money in the enemy's country to pay and even augment his army.

Amurath, being alarmed at the proceedings of Scanderbeg, sent Ali basha, at the head of 40,000 men, to prevent his excursions, but Scanderbeg had the good fortune to defeat him. The Turkish emperor, dreading the consequence of these successes, patched up a peace with the Hungarians, that he might have an opportunity of bending his whole force against Scanderbeg. The Hungarians soon became sensible of the error they had committed, in making a peace with the Turks at the time the prince of Epirus was so successful, and consequently enabled to make a powerful diversion in their favour; these sentiments were followed by a breach

of the treaty : they were, however, totally routed at the battle of Varna, and their king, Uladislau, was slain in the field.

Amurath now determined that his forces should plunder Epirus; but three armies, which he sent for that purpose, were severally defeated by the fortunate Scanderbeg; and it is remarkable, that in all their engagements Scanderbeg's forces never amounted to above a third part of the number of the Turks.

Distracted at length with his continual losses, dis-appointments, and defeats by an handful of men, Amurath in a rage raised an army of 140,000 men, at the head of which he himself marched, and laid siege to the capital city of Croia, which was defended by a strong garrison and a brave governor, on whom Scanderbeg could depend, while that prince commanded a flying army in the mountains, which continually harassed the Turkish forces. Amurath assaulted the city many times with great fury, but not being able to carry it, he died before its walls, in the thirtieth year of his reign, and in the year of our Lord 1450, and was succeeded by his eldest son Mahomet, surnamed

Mahomet the second. This prince, immediately upon the death of his father, raised the siege, and returned to Adrianople.

Mahomet began his reign by murdering his brothers, and then proceeded to besiege Constantinople, which he took on May the 20th, 1453. The last Grecian emperor, Constantine Paleologus, was killed in the assault, and all his relations, with the principal citizens, afterwards put to death in cold blood by Mahomet. The plunder of this wealthy city was given to the troops; the seat of government was transferred from Adrianople to Constantinople; and having thus added the Grecian empire to his own, he first assumed the title of Emperor, which the succeeding sovereigns of the Turks have ever since retained.

Irene, a beautiful Grecian virgin, was taken among other captives in Constantinople, with whom Mahomet became so enamoured, that he neglected all public affairs for the enjoyment of her society in private. This remissness, with respect to the business of the state, occasioned a dangerous mutiny among the Janissaries; but Mahomet's temper was so fierce and savage, that none durst mention to him the situation of his affairs. It may perhaps surprize many that such a soul was capable of a tender impression; but

- " Love various minds does variously inspire;
- " He stirs in gentle natures gentle fire,
- " Like that of incense on the altar fire;
- " But raging dames tempestuous souls invade;
- " A fire which ev'ry windy passion blows,
- " With pride it mounts, and with revenge it glows."

At length one of his bassas ventured to acquaint him with his danger; Mahomet severely reprimanded him for his insolence, as he termed it; but being sensible of the reasonableness of his advice, he told him, " That his subjects should find that he could rule his passions as well as he could rule kingdoms." He then gave orders that the principal officers of the army, and all the great officers of state should attend him the ensuing day in the divan.

At the time appointed, every one attended with wondering expectation. The emperor appeared, and with him the beautiful Irene, dressed with the most costly care in all the extravagance of Asiatic elegance:

- " Fancy not fairer paints thro' heav'n-born maids,
- " Daughters of Paradise, for ever young,
- " For ever blooming; who, on beds of flowers,
- " By streams of living waters, fast repose,
- " To crown th' immortal bliss of happy souls
- " With raptures unconnect'd."

Mallet.

The emperor then ordered the lovely Greek to stand upon a raised floor, and sternly demanded of all present, if they thought he was blameable for devoting himself to so charming an object. They unanimously agreed that it was impossible for any man to resist so much

beauty. " Then, said he, you shall find that I am more than man." So saying, he instantly seized the fair Irene by her beautiful locks of hair, and struck off her head with his scymetar, to the great astonishment of all present. Some have greatly commended, and others have severely blamed Mahomet on account of this singular transaction. Among the former, a noble satirist of Charles the second's time applauds him exceedingly, and recommends his conduct in the following lines, addressed to that licentious monarch:

- " Go read what Mahomet did; that was a thing
- " Did well become the grandeur of a king;
- " Who, all transported with his mistress' charms,
- " And never pleas'd but in her lovely arms;
- " Yet, when his Janissaries wish'd her dead,
- " With his own hand cut off Irene's head."

Whether Mahomet was fated by the long uninterrupted possession of Irene's charms, or was really that patriotically heroic monarch he wished to be thought, is immaterial; but it is our opinion, that he might either have parted from the lady, or evinced his regard for his subjects without proceeding to such a barbarous extremity. His ferocious conduct plainly proved that all his passions were of the brutal kind; his love being founded on sensuality, and his pretended sentiments of honour on a savage parade of dignity.

Being entirely roused from his lethargy by his late danger, he deprived some of the princes of the Morea of their territories, subdued Servia, and laid siege to Belgrade, but was defeated by Hunnades, the brave prince of Transilvania, who unhappily died the same year. Mahomet then attacked the Mahomedan princes on the south coast of the Euxine sea, particularly the prince of Sinope, whose capital he besieged by sea and land; which being surrendered to him, he invested Trebizonde, took it, and put an end to that little empire.

Mahomet then extended his conquests in Europe, and subjugated Walachia. His prodigious success obtained him the name of Great; nevertheless, he was a most abandoned cruel wretch, and guilty of almost every crime which could debase human nature. He died A. D. 1481, in the thirty-third year of his reign.

Bajazet II. his eldest son, succeeded him; but spent so much time in a pilgrimage to Mecca, that he was near being supplanted by his brother Zemes. This so much injured him, that he had his brother murdered, and rewarded the assassin with the post of prime minister, though he was only a barber. He took several towns from the Venetians; but was continually alarmed with domestic plots against his life, which at length succeeded; for he was assassinated by the Janissaries, and his son Selim made emperor.

Selim began his reign by murdering his father, his brothers, and all their children: he then subdued the Mamelukes, and put an end to their empire in Egypt, which from that time became a Turkish province. Selim died, A. D. 1510, in the fifty-fourth year of his age, and tenth of his reign, as he was preparing to invade the Christian princes.

Solyman the Second, or Solyman the Magnificent, succeeded his father Selim, and immediately after his accession, laid siege to Belgrade, which he took on the 20th of August, 1521. He invaded the island of Rhodes the year ensuing, the capital of which submitted to his arms on Christmas day, 1522. Solyman then invaded Hungary, defeated the Hungarians, and took the cities of Buda, Pest, and Segedin. In 1529 he penetrated into Austria, and laid siege to Vienna, but it was so well defended, that he was obliged to raise the siege, and retire: he, however, returned again into Austria with an army of 500,000 men, but the emperor, and other Christian princes, being well prepared to receive him, he again retreated to Constantinople.

The celebrated Genoese admiral, Andrew Doria, joining the fleets of several Christian powers, particularly that of the Spaniards, invaded the Morea. Solyman, in return, ordered his fleet, under the command of his admiral Barbarossa, to plunder the coasts of Italy

and Sicily; these orders being obeyed, the Turkish admiral flood over for the African coast, where he depoted the deys of Algiers and Tunis, and had those kingdoms confined to him by Solymán.

In the mean time Solymán, with a large army, invaded Persia, but met with very little success in this expedition. He then sent a fleet to the Red Sea, to attack the Portuguese settlements in the East Indies; but his design likewise proved abortive.

The French, who were contending with the emperor of Germany for the Milanese, now made an alliance with the Turks, whose fleets again plundered the Italian and Sicilian coasts, and the Ottoman armies met likewise with great success in Hungary and Italy.

In 1548 Solymán again invaded Persia, but the Persians destroyed the country before him as he advanced, by which means most of his army perished, and he was obliged again to retreat; but, to make him some amends, he, in 1551, took the strong city of Temeiswær in Hungary, and the territories belonging to it.

Solymán, who was now advanced in years, was so absurdly fond of his concubine Roxalana, that he put his eldest son Mustapha to death to oblige her, and even consented to marry her, though no Turkish sovereign, since the time of Bajazet, had ever been married, as it was contrary to the policy of the Turkish government.

Bajazet, the youngest son, soon after underwent the same fate as his brother Mustapha, for being concerned in a plot against the government. The Turks now made a fruitless attack upon the island of Malta, but still continued successful in Hungary; when death put an end to Solymán's progress, A.D. 1566, and took him off by means of a bloody flux in the 77th year of his age, and 47th of his reign.

Selimus, or Selim the Second, the only surviving son of Solymán, succeeded him, whose first expedition was to invade the island of Cyprus. He laid siege to Nicosia, which he took by storm, A.D. 1570; and the ensuing year he invaded Famagusta, which capitulated upon honourable terms; but the garrison were no sooner marched, than a great number of the inhabitants were massacred, and the brave governor Bragadino was flayed alive. The bafsa Mustapha here found an immense treasure, which he put on board three ships, together with many lovely captives, among whom was a young lady of exquisite beauty, who, dreading the thoughts of being sacrificed to the embraces of a Turk, set fire to the powder, which blew up the ship in which she was, and the two others that were near it, together with herself, all the Christian captives, and the Turkish sailors. In the mean time the Turkish admiral proceeded to make descents on many of the Venetian islands, as Epirus, Dalmatia, &c. from whence he carried many thousands of the inhabitants into captivity. It is affirmed, that the town of Cuzula was forsaken on the approach of the Turkish fleet, by the governor and all the men; but that the women taking up arms, defended the place till a storm arose, and obliged the Turks to retire to their galleys, in order to preserve them. If this recent circumstance is fact, why should the moderns discredit the existence of the ancient warlike race of Amazons?

- "So march'd the Thracian Amazons of old,
- "When Thermodon with bloody billows roll'd;
- "Such troops as there in shining arms were seen,
- "When Theseus met in fight their maiden queen;
- "Such to the bold Penthesilea led
- "From the fierce virgin when the Grecians fled;
- "With such return'd triumphant from the war,
- "Her maids with cries attend the lofty car;
- "They clasp with manly force their moony shields,
- "While female shouts rebound the Phrygian fields."

Courage certainly is of no sex, but a faculty of the soul; and however custom may deprecate, or discourage it in females, it is naturally belong to human nature in general. If men possess a more determined courage in perils which they foresee, women are allowed to be blessed with a superior presence of mind in sudden dangers; and, perhaps, the latter is one of the most distinguishing characteristics of real courage.

- "All desperate hazards courage do create,
- "As those play frankly who have least estate;
- "Presence of mind, and courage in distress,
- "Are more than armies to procure success."

DRYDEN.

Perhaps the subordination to which women have been reduced by the policy of most nations, may in some measure have repressed that ardent spirit for which the female soul seems to have been peculiarly formed by nature; for the very idea of slavery renders the soul timid,

- "True courage, but from opposition grows;
- "And what are fifty, what a thousand slaves,
- "Match'd to the finew of a single arm
- "That strikes for Liberty!"

BROOKE.

In the year 1571, the Turks fitted out the largest fleet that ever they sent to sea, which was engaged, at the entrance of the gulph of Lepanto, by the united Christian fleet, commanded by Don John, brother to the king of Spain, in conjunction with the Venetian admiral. The fight was obstinate and bloody, and lasted five hours, when the Ottoman fleet was totally defeated, the Turkish admiral, with 15,000 of his men, were killed, and 160 gallees taken, or sunk: the Christians, on their parts, lost about 6000 men, among whom were many brave and distinguished officers.

After this defeat, Selim equipped another fleet, and took Tunis, on the Barbary coast, from the Spaniards, which was the last considerable action of his life, for he died Dec. 9, 1574, in the 52d year of his age, and ninth of his reign, and was succeeded by his eldest son.

Amurath the Third, who like his predecessors, began his reign by the murder of his five brothers; and, to prove himself a true Turk, and not inferior in cruelty to any of his ancestors, he had them executed in his presence. That nothing might be wanting to complete the spectacle, he obliged his late father's favourite sultana to be present, who was so affected at the massacre of the young princes, that she stabbed herself to the heart, and expired in the presence of the young tyrant.

- "Foul deeds will rise,
- "Though all the earth o'erwhelm them to men's eyes;
- "And murder, tho' it have no tongue, will speak
- "With most miraculous organ."

Amurath attempted to reduce the Persians, but lost three fine armies in the attempt. These disappointments so chagrined him, that in 1589 he assembled an army of 180,000 men, and gave the command of it to the Grand Vizir. In this expedition, the Turks lost 80,000 by the sword and famine, for the Persians always waste the country when they are invaded, which renders a Persian war much more disagreeable to the Turks than any other. In 1592, as the sultan found that his troops carried on this war with great reluctance, he withdrew the army from Persia, in order to employ it in Hungary. Nothing, however, decisive was done, and Amurath died, Jan. 18, 1595, in the 33d year of his age, and 20th of his reign.

Mahomet the Third, the son of the above sultan, began his reign, according to the Ottoman custom, by putting his brothers to death, who were no less than twenty in number: this, however, did not satisfy him, for he ordered ten of his father's concubines, whom he imagined to be pregnant, to be thrown into the sea. As soon as he was seated upon the throne, finding that his general Ferrat Bassa had been unsuccessful in Hungary, he ordered him to retire. The Christians, however, still proving victorious, Mahomet assembled an army of 200,000 men, put himself at their head, took the city of Agria, where he practised unheard-of cruelties, and afterwards defeated the Christian army, by which means he recovered Moldavia and Wallachia. Being obliged to march back into his own country, to quell some domestic tumults, the Christians seized the opportunity, and recovered many of the places they had lost.

lost; while, on the other side, the Persians retook Tauris. Mahomet's cruelties had rendered him so obnoxious to the people, that a conspiracy was formed to depose him, and place his eldest son upon the throne. Being apprized of the affair, he had his son strangled, and put to death all the conspirators who were so unfortunate as to fall into his power; but now, being every where unsuccessful, and many of the insurgents continuing in arms, he began to think that the wrath of God pursued him for his manifold crimes. To avert, therefore, the vengeance of heaven, he ordered prayers to be put up for him throughout his dominions, and sent two mollahs, or priests, barefoot on a pilgrimage to Mecca. He, however, died in 1604, with all the horrors of a guilty conscience upon him.

"Conscience, what art thou? thou tremendous pow'r,
"Who dost inhabit us without our leave,
"And art within ourselves another self,
"A master self, that loves to domineer,
"And treat the monarch frankly as the slave:
"How dost thou light a torch to distant deeds,
"Make the past, present, and the future frown;
"How, ever and anon, awake the soul,
"As with a peal of thunder, to strange horrors!"

Dr. YOUNG.

Mahomet, at the time of his death, had reigned nine years, and was in the 45th year of his age. He was succeeded by his son

Achmet, in whose reign the Turks gained some advantages over the Christians, being joined by the Protestants of Austria, Hungary, and Transylvania, who were so cruelly persecuted by the Roman Catholics, that they were obliged even to seek succour from Infidels.

Achmet's principal fault, understanding that the emperor had taken one of his sister's slaves to his bed, was so inflamed with jealousy, that he caused her to be strangled. This Achmet repented, by stabbing her, and trampling upon her body. At length he departed this life on the 15th of November, 1617, in the 31st year of his age, and 13th of his reign, and was succeeded by his brother Muffapha.

The accession of Muffapha was extremely singular: the brothers of the sultana had usually been put to death by the reigning sovereign, through the absurd idea of rendering himself secure; but Achmet, being only 13 years of age when he began his reign, was advised to spare his brother Muffapha, till he saw whether he should have any children of his own, as no other prince of the Ottoman family was then living.—Thus Muffapha was secured by the policy of the state, till Achmet had children, when it was debated in council whether he should not be put to death, and the execution was agreed upon accordingly; but Muffapha was again providentially saved, for Achmet dreaming that he saw his brother executed, was so terrified at the visionary spectacle of horror, that he would never suffer the sentence to be put in execution. Muffapha, however, reigned but five months; for the ballas finding him totally unqualified to govern, they again confined him to the seraglio, and advanced his nephew Osman to the throne.

Soon after the commencement of his reign, Osman marched to the frontiers of Poland; but the janissaries refusing to march any farther, he was obliged to patch up a dishonourable peace with the Poles: this so enraged him, that he determined totally to abolish the body of janissaries; which those regular braves understanding, they murdered him in 1622, and restored his uncle Muffapha to the throne: but he being no better qualified to govern than before, was a second time deposed, and Amurath, Osman's younger brother, advanced to the imperial dignity.

The reign of this prince, Amurath the Fourth, which commenced in 1623, was not only filled with insurrections and mutinies, but the Persians ravaged the Turkish frontiers, and took Bagdad, which the Ottoman forces besieged three years, without being able to recover. This emperor was a cruel tyrant, but he was certainly impartial in his brutality, equally oppressing

and murdering Christians and Turks. A dramatic writer very justly observes, that the most savage animal in the whole creation, is a human creature without feeling.

A dreadful fire happened at Constantinople during this reign, which consumed upwards of 20,000 houses. Amurath, however, determined on a Persian war; but, being in great want of money, he encouraged a number of informers to accuse the richest people he could get intelligence of with being guilty of various crimes. This gave him a pretence to put them to death, and seize their effects. By these infernal means he was enabled to raise an army of 300,000 men, when, marching to the frontiers of Persia, he took Tauris, ordered it to be plundered by his soldiers, marched back without achieving any thing farther, and then ordered a festival of seven days to celebrate his wonderful conquests!

The cruelties of Amurath now grew dreadful to every one; the murders he committed were incredible, and the modes of execution were shocking to human nature; among the rest, his brothers Bajazet and Orchan fell victims to his ferocious disposition: indeed murder was his supreme delight, for his most favourite amusement was to fit in a pavilion, in the palace gardens, and fire upon those who passed by in boats, by which means he killed a prodigious number. Indeed, it must be admitted, that he seldom performed these frolics but when he was drunk; but the worst affair for his subjects was his seldom being sober.

In 1637, he again prepared to invade Persia, but before his departure caused another of his brothers to be strangled, who was a most accomplished and promising young prince. He then invested Bagdad, when the garrison surrendered on condition of receiving no personal injury. Amurath solemnly promised to spare their lives; but they had no sooner laid down their arms than he ordered them all to be cut to pieces, including in the bloody mandate not only men, but women and children. For this conquest he caused a festival to be proclaimed of twenty days continuance, at which he very happily drank himself into a fever, that took him off on the 8th of February 1640, in the 18th year of his reign, and only 34 of his age: well might his subjects have said,

"Our emperor is a tyrant, fear'd and hated;
"We scarce remember in his reign one day
"Pais guiltless o'er his execrable head;
"He thinks the sun is lost, that sees not blood;
"When none is shed, we count it holiday,
"We, who are lost in favour cannot call
"Our lives our own."

This tyrannical brute was succeeded by his brother Ibrahim.

Some suppose, that the reason why Ibrahim was not murdered as well as the rest of his brothers, was owing to there not being any other prince of the Ottoman line living; but others say, that he was an idiot, on which account Amurath despised him too much to think him dangerous.

Ibrahim, however, had more cunning than was supposed; for it appeared that he had acted slyly only to secure his life, and pretended to intend only to preserve himself from being murdered.

In the beginning of his reign he put an end to the ravages of the savage Cossacks, took the city of Asoph, and added the greatest part of the island of Candia to the Turkish dominions. He was, however, deposed by his mother and the janissaries in 1648, and murdered soon after; his son, (Mahomet IV.) then a child of seven years of age, being placed on the throne.

The sultana mother, the grand vizir, and the aga of the janissaries were invested with the administration, during the minority of the emperor; but, affairs turning out a little unsuccessful, the grand vizir was soon deposed, as were several others who succeeded him; for whoever is in fault, that minister is sure to bear the blame. In 1658, a formidable insurrection was with difficulty suppressed. The Turks were next visited by the plague, which usually carried off 1400 or 1500 people every day in the city of Constantinople only.

In Hungary an obstinate battle was fought between the Christians and Turks, in which the latter were totally defeated, and left 17,000 men dead on the field of battle; this occasioned a peace between the Porte and the emperor of Germany; however, to recompense the above loss, the ancient Chaldaea was subdued, and added to the Turkish empire, and the island of Candia totally conquered.

In 1672, the Turks invaded Poland, conquered many of its towns, and obliged the government to consent to pay 70,000 dollars annually; but on the failure of the stipulated payment, the war again began in the ensuing year, when the Polish general, Sobieski, had the good fortune to obtain a signal victory over the Turks. About the same time the people of Tripoli, in Barbary, killed the pasha, and threw off the Turkish yoke, by which they became independent of the Porte in every thing, a trifling tribute excepted.

In 1683, the Turks laid siege to Vienna, but were attacked in their trenches, and routed by John Sobieski, king of Poland, at the head of the Germans and Poles. The city of Buda was afterwards invested by the Imperialists, and taken, Aug. 22, 1686. King George the First, then elector of Hanover, was present at this siege; and from thence brought the two Turks, who afterwards constantly attended him when he was king of England: several other noble volunteers were present, particularly lord Cutts, who took a young Turk prisoner, to whom he gave the name of Budiana; this Mahometan afterwards turned Christian, and became an officer in the English service.

In the same year, the Venetians recovered great part of the Morea, prince Lewis, of Baden, totally defeated the Turks, and the Poles gave a great overthrow to the Tartars. These and other subsequent successes so dispirited the troops, that they demanded the grand vizir's head; this the grand seignior sent them with the heads of several other great officers, without which they did not appear disposed to be satisfied; but as all his compliance, they deposed him in the 39th year of his reign, and 53d of his age. He was not, however, murdered, but died in the seraglio five years after.

Solyman III. the brother of the last emperor, was advanced to the throne in 1687. In the beginning of this reign, the duke of Bavaria took Belgrade, prince Lewis, of Baden, obtained a victory over the Turks at Bosnia, and the Venetians extended their frontiers in Greece and Dalmatia. This run of ill luck induced the Turks to offer very advantageous terms of peace to the Christians; but the treaty was broken by the machinations of the French king, Lewis XIV. who promised to invade Germany, and divide it with the Turks; but neither the Turks nor the French were able to compass their designs, and Solyman died in the 4th year of his reign, and 54th of his age; his brother, Achmet the Second, succeeding him in 1691.

A numerous army now passed the Danube, but on the 19th of August, 1691, the Turks were defeated by prince Lewis, of Baden, when the grand vizir, and 28,000 men were slain. Achmet died in the 4th year of his reign, and 51st of his age, and was succeeded by his nephew

Multapha the Second. This prince raised an army of 120,000 men, took Lippsa, and defeated the Imperialists; his fleet was likewise successful against the Venetians; but on the other hand the Russians took Azoph from him, and opened a communication to the Black Sea.

In 1692, prince Eugene defeated the Turks at Olach, when the prime vizir, and 30,000 men, were slain. A dishonourable peace being now concluded, the sultan was deposed in 1703, and his brother Achmet advanced to the throne.

The first thing that Achmet the Third did, was to displace all the great officers of state, who had brought about the revolution in his favour, by reason, as it was said, of their assuming too much upon that account.

The king of Sweden, in 1709, after his defeat at Pultowa, took refuge in the Turkish territories, and had sufficient interest to stir up the grand seignior to

declare war against the czar of Moscow: the czar raised a large army, but not acting with prudence he was soon compelled to sign whatever conditions the grand seignior pleased to prescribe.

In 1715, the Turks subdued the Morea, on which the emperor of Germany declared war against them; and the Ottoman army in 1716, was defeated at Carlowitz, by prince Eugene. In this battle, the grand vizir, the aga of the janissaries, a great number of pashas, and 100,000 men were slain; Temeswar was taken by the Imperialists this campaign; and in 1717, prince Eugene took Belgrade, and again defeated an army of Turks, consisting of 200,000 men. A peace was, however, concluded in 1718, by the mediation of Great Britain and Holland.

In 1722, the Turks invaded Persia, and had some success till compelled to retire by the celebrated Kouli Khan: Achmet's ill success occasioned him to be deposed, and his nephew, Mahomet, was, in 1730, advanced to the throne.

Mahomet the 5th, on his accession, made peace with Persia, and entered into a war with Russia. In the year 1737, the Turks defeated the Imperialists at Crotka, and took Orlova. In 1739, they besieged Belgrade; but a treaty being entered into between the Germans, French, and Turks, it was unanimously agreed, that the Turks should have Belgrade, but the fortifications were to be demolished. The Danube and Save were to be the northern boundaries of the Turkish territories, the river Atlanta and the iron gate mountains, the eastern boundary, and the river Unna, the western limits, towards the German dominions.

The Russians, by another treaty, were obliged to demolish all their forts on the Palus-Meotis and Euxine Sea, and to destroy the fortifications of Asoph.

This monarch was of a pacific and just disposition, and on that account respected much by the Christian princes; nothing material, but what is above related, happened during his reign, and on the 13th of December, 1754, at about one o'clock, he died suddenly of a fit of the asthma, and about three the same afternoon his brother Osman was proclaimed from the minarets of the mosques. Osman the Third began his reign in a time of profound tranquillity, and nothing material occurred till his death, which happened in 1757, when he was succeeded by his brother Multapha.

Multapha the Third began his reign with every personal advantage: he was of a different disposition from any of his predecessors, being of a liberal way of thinking, a lover of learning, and the first who introduced the art of printing into the Ottoman empire. In the year 1766, a general spirit of liberty seemed to diffuse itself through many parts of the world. The Turkish empire was affected by its influence, the Georgians began to aspire at independence, and many insurrections happened in Egypt and Cyprus; which, though suppressed, evinced the spirit of the people.

In 1768, a war broke out between Russia and the Porte; a confederacy was formed against the Russians among their own subjects and dependants which was fomented and increased by the Ottomans. The confederates were, however, obliged to retreat into the Turkish territories. The Russians formed a line of troops along the frontiers of Poland, large bodies of Tartars appeared on the Russian shore, and a Turkish army was assembled between Choczup, Bender, and Ockakow.

In June 1769, the Russian admiral, Spiridoff, set sail for the Levant with a powerful squadron. Admiral Elphinstone soon followed with another considerable fleet, and arrived in the Morea in 1770. Count Orloff in a short time after joined the Russian fleet off Paros with another squadron.

An engagement soon after happened between the Turkish and Russian fleets, near Napol-di-Romain, in which the former were totally defeated, and took shelter in the harbour of the above mentioned place, whither admiral Elphinstone pursued and did them great damage.

During this time count Orloff was acting by land in the Morea, but he soon after joined the other squadrons,

squadrons, and the whole fleet, on the 7th of July, 1770, engaged that of the Turks, when the Ottomans received a total defeat. In this fight, which was very bloody and desperate, admiral Spiridoff engaged the Capitans of 100 guns, yard arm to yard arm, when the Turkish ship taking fire, the flames communicated to the Russian ship: both unhappily blew up, and the crews, a few officers and men excepted, perished, either in the explosion or the waves.

The Turks now fled, in order to secure themselves in the bay of Schisma, where a few nights after, their fleet was fired by means of three fire-ships. A person, who was upon the spot, mentioning this action, says, "A fleet consisting of 200 sail, almost in one general blaze, presented a picture of distress and horror dreadfully sublime; while the flames with the utmost rapidity were spreading destruction on all sides, and ship blowing up after ship, with every foul on board, that feared to trust the waves to swim for shore; the Russians kept pouring upon them, such showers of cannon balls, shells, and small shot, that not one of the many thousands of their weeping friends on land, who saw their distress, dared venture to their relief. Nothing now remained but united shrieks, and unavailing cries, which, joined to the martial music and the loud triumphant shouts of the victors, served to swell alternately the various notes of joy and sorrow, that composed the solemn dirge of their [the Turks] departing glory."

The loss on the part of the Russians was admiral Spiridoff's ship, and between 700 and 800 men; on the side of the Turks, besides the destruction of their whole fleet, above 9000 men perished.

The Turks in great consternation quitted Schisma, and hastening to Smyrna, murdered an incredible number of Greeks and other Christians, whom they supposed to be well affected to the Russians, sparing neither age nor sex.

The Russians, in this expedition, spread desolation through the coasts of Greece, Asia, and the Islands of the Archipelago, and greatly injured the trade of the Levant; but they acquired little benefit to themselves by their successes. This year, likewise, the Turkish army on the Danube, under the command of the grand vizir, was attacked in its trenches, at Babadagh, and totally routed.

In 1772 negotiations were set on foot in order to bring about a peace, but the plenipotentiaries not agreeing, the whole fell to the ground; nothing, however, was performed this year decisive or worth mentioning by either army.

In Egypt and Syria the people were in open rebellion; Ali Bey was, however, defeated and driven out of Egypt by Mahomet Aboudaib, when he sought refuge in Syria, and was affectionately received by his friend Cheik Daher, an Arabian prince.

On the 21st of January, 1774, the emperor, Mustafa the third, departed this life at Constantinople, in the 58th year of his age, and 17th of his reign, with the character of having been the wisest, best, most humane and disinterested monarch that ever sat upon the Ottoman throne.

Abdul-Hamet, the brother to the late emperor, succeeded him. Some commotions were made in favour of the young prince Selim, but they were easily suppressed, and the war upon the Danube was carried on with vigour, nor did the Ottoman ministry fail to encourage as much as possible the rebellion of Pugatscheff against the Russian government. The Turks were, however, defeated in various engagements; disorder, mutiny, and desertion prevailed among the troops; the grand vizir, being abandoned by the greatest part of his forces, was obliged to accede to the terms prescribed by the enemy, who had surrounded him at Schumla. These ill successes threw the whole Ottoman empire into confusion; the Porte, however, under the present complexion of affairs, thought proper to ratify the articles of peace; the principal of which were,

1. The independency of the Crimea. 2. The absolute cession to Russia of Kiburn, Kerchi, Jenichala, and all the district between the Bog, and the Dniester. 3. A free navigation in all the Turkish seas, including

the passage through the Dardanelles, with all the privileges and immunities, which are granted to the most favoured nations.

In return for which concessions, Russia was to restore all she had conquered, Afoph and Taganrok excepted.

The grand vizir died, as is supposed, of a broken heart, on his return to Constantinople; and public rejoicings were made at St. Petersburg, for the uncommon success of the Russian arms.

The rebel, Pugatscheff, was soon after defeated by the Russian army, taken prisoner and put to death.

The year 1775, proved fatal to the old and brave Cheik-Daher, his country being conquered by Mahomet Aboudaib, with an army of Egyptians; but Aboudaib dying in the midst of his successes, Cheik-Daher was in hopes to have retrieved his affairs, when a bassia arrived upon the coast of Syria with a considerable reinforcement. Cheik Daher was soon subdued, his treasures seized, and his head sent to Constantinople.

As we are not acquainted with any circumstance that deserve mention more recent than the above, we shall conclude the Turkish history with the two following useful tables:

A TABLE of the OTTOMAN KINGS and EMPERORS.

	No.	NAMES.	Began to reign.
KINGS.	1	Ottoman, or Osman	A. D. 1300
	2	Orchanes	1328
	3	Amurath	1359
	4	Bajazet	1373
	5	Solyman	1400
	6	Mahomet	1404
	7	Amurath II.	1422
EMPERORS.	8	Mahomet II.	1450
	9	Bajazet II.	1481
	10	Selimus	1512
	11	Solyman II.	1520
	12	Selimus II.	1566
	13	Amurath III.	1574
	14	Mahomet III.	1595
	15	Achmet	1604
	16	Mustapha	1617
	17	Osman, or Ottoman II.	1618
	18	Morat, or Amurath IV.	1623
	19	Ibrahim	1640
	20	Mahomet IV.	1648
	21	Solyman III.	1687
	22	Achmet II.	1691
	23	Mustapha II.	1695
	24	Achmet III.	1703
	25	Mahomet V.	1730
	26	Osman III.	1754
	27	Mustapha III.	1757
	28	Abdul-Hamet	1774

A TABLE, by which the years of the Heigera may be reduced into years of the Christian Era, answerable thereto.

33	1	627	19
66	2	660	20
99	3	693	21
132	4	726	22
165	5	759	23
198	6	792	24
231	7	825	25
264	8	858	26
297	9	891	27
330	10	924	28
363	11	957	29
396	12	990	30
429	13	1023	31
462	14	1056	32
495	15	1089	33
528	16	1122	34
561	17	1155	35
594	18	1188	36

This table, may be continued farther, adding always 33 to each number of the first column, and one to each number of the second. The use of it is thus: to the given year of the heigera, add always 621, the year of Christ answerable to the first year of the heigera, and from the sum subtract always the number that is in the table against the given year; or if that number is not in the table, look for the number that is nearest to it. For example,

Suppose you would know what year of the Christian

Æra answers to the year 858 of the heigera, add 621 to 858, thus:

858

621

1479

From the total subtract 26, which in the table stands against 858, the remainder 1453 will be the year of the Christian Æra answering to the given year of the heigera.

CHAP. X.

INDOSTAN, or INDIA PROPER.

SECT. I.

Its Situation, Extent, Divisions, Subdivisions, &c.

THE principal and richest part of India, called Indostan, is better known from the inestimable commodities, which it produces, than from any authentic histories of it, which have been transmitted to us from ancient records. European avarice hath, however, taught innumerable fordid adventurers to study its geography sword in hand; they have waded through blood to glean riches, and by that means have furnished us with modern annals which shock humanity to read. The bowels of the inhabitants have been ript open to come at the precious products of the bowels of the earth; the richness of the country has been the greatest misfortune to the natives, their gold shines, and their diamonds blaze but to invite robbers to plunder them; and while the heat of the climate, and the delicious fruits of the earth lull the effeminate people into the lethargic slumbers of luxury, they become an easy prey to those who are more fordid and bold, and have less conscience than themselves.

Well may the worldly miser pant for these regions, and say,

Wast me! O wast me! to that distant shore,
Where dwells the precious idol I adore:
Health, danger, friends, religious, moral ties,
I from the bottom of my soul despise;
And pant for nothing but the glittering prize.
Had happy clime, whose bosom gold contains,
Whose bowels glow with radiant brilliant veins;
Thy rivers wealthy as the flaming mine,
With golden sand, and diamond pebbles shine:
To grasp at treasure is alone to live:
Is there a blessing but what wealth can give?
Ten ample lack, of dear rupes I'd take,
And freely part with conscience for their sake:
What's virtue, or humanity to me,
When captivating precious stones I see?
To be a Man, and poor, will never do,
I'll Brute commence, and be a rich one too.

With equal propriety, while the avaricious feasts his mind with golden hopes, may the voluptuous covet the luxurious fertility of the country, in the elegant words of Thompson.

"Bear me, Pomona, to thy citron grove,
"To where the lemon, and the piercing lime,
"With the deep orange glowing through the green,
"Their lighter glories blend: lay me reclin'd,
"Beneath the spreading tamarind that shakes,
"Tann'd by the breeze, its fever-cooling fruit.
"Quench my hot limbs, or lead me thro' thornage,

"Embow'ring endless of the Indian fig;
"Or thrown at gayer ease, on some fair brow,
"Let me behold, by breezy murmurs cool'd,
"Broad o'er my head the verdant cedar wave,
"Or stretch'd amid these orchards of the sun:
"Give me to drain the cocoa's milky bowl,
"And from the palm to draw its freshening wine;
"More bounteous far, than all the frantic juice
"Which Bacchus pours; nor on its slender twigs,
"Low bending be the full pomegranate scorn'd,
"Nor creeping through the woods, the gelid race
"Of berries; oft in humble station dwells
"Unartful worth, above fastidious pomp;
"Witness, thou best anana, thou the pride
"Of vegetable life, beyond what'er
"The poets imag'd in the golden age:
"Quick, let me trip thee of the tufty coat,
"Spread the ambrosial stores, and feast with Jove."

Though a chain of immense mountains separates these regions from China, Tartary, and Persia; yet India on this side the Ganges was anciently subject to the Persians, and Alexander the Great pushed his conquests into India, to the extremity of those parts which had been tributary to Darius. Previous to the time of Alexander, some Grecians had traversed India in search of science; and above 2300 years since, the celebrated Pilpay there wrote his admirable fables, which have since been translated into most of the known languages in the world.

Indostan received its name from the river Indus, and is by the natives called Mogulistan, or the empire of the Great Mogul. It lies between the Indus and the Ganges, which fall into the Indian ocean at the distance of 400 leagues from each other. It is bounded by Ulbec Tartary and Tibet on the north; by Achem, Ava, and the bay of Bengal on the east; by the Indian ocean on the south, and by the same sea and Persia on the west. It is situated between 66 and 92 deg. of east long. from London, and between the 7th and 40th deg. of north lat. being 2042 miles long from north to south, and upwards of 1400 broad in the widest part from east to west.

The empire of the Mogul is divided into several provinces; though it cannot be said that he is sole and absolute master of them all, as there are some rajahs or petty sovereigns independent of him.

The north-east division of India contains the province of Bengal, as well as Jessal, Naugraut, Patna, Necbol, Gor, and Rotas. The north-west division extends to the frontiers of Persia, and contains the provinces of Soret, Jess Inere, Sinda, Tatta, Bucknor, Maltan, Hercan, and Cabul. These are all situated on the river Indus. The south-east coast, or coast of Coromandel, contains Orix, Golconda, the

east side of Bijnagar, or the Carnatic, Madura, and Tanjore, Afme, Jengapour, Cossimere, Hendowns, Lahor, Agra, Delhi, Gualcor, Narvar, Katipor, Chitor, Berar, and Candish, are situated in the center division. And the south-west coast contains Guzarat, Decan, and Bijnagar, or the Carnatic.

The tropic of Cancer runs through the centre of the empire; the southern part lies within the torrid zone; yet in the very hottest part of the year, there are generally rains which from about the end of June to November refresh the earth and cool the air; the showers then, especially in August and September, fall for several days without intermission, attended with thunder and lightning: even in the fairest weather they have lightning, though without thunder, for several weeks successively; but this lightning never does the smallest detriment; the skies at that season are clear and serene, and the earth refreshed with gentle breezes which in the mornings and evenings are extremely agreeable; the heavens have a most beautiful appearance, and vegetables spring forth with incredible forwardness. The air is perfumed with the choicest fruits, affording an wholesome and refreshing nourishment, while the trees form a shade impenetrable to the rays of the sun.

But it behoves us here to be particular with regard to what are called the monsoons or periodical winds. These winds blow six months in one direction, and six in the opposite direction; for instance, suppose they blow from the south-west from April to October, then they turn about and blow from the north-east from October to April; and at the shifting or breaking up of the monsoon, there are usually such storms of wind as will not suffer a vessel to ride with any degree of safety.

The chief rivers of this empire are the Ganges and the Indus; the former rises from different sources in Tibet, and, after several windings through Caucasus, penetrates into India, across the mountains on its frontier. This river, after having formed in its course a great number of large, fertile, and well peopled islands, discharges itself into the sea by several channels, of which only two are frequented.

The Ganges is held in the very highest esteem by the Indians, who worship it as a deity, deeming that person happy who terminates his existence upon its margin, and even soliciting that family, an individual of which hath been drowned in its stream. Towards the source of this river was once the city of Palibothra; the antiquity of which was so great, that Diodorus Siculus scruples not to say it was built by that Hercules, to whom the Greeks ascribed the most surprising actions which had been performed in the world. In the days of Pliny, the opulence of Palibothra was celebrated throughout the globe, and it was the general mart for the inhabitants of both sides the river that washed its walls.

The Ganges runs a course of about 3000 miles.

The Indus, which runs an equal course, waters the western side of India, flowing from the north-east to the south-west, and falling into the Indian ocean by three channels.

There are several other rivers, as the Attock, (the Hydaspes of the antients) the Jemmima, the Guenga, &c. which are all too insignificant to merit a particular description.

The mountains of this country divide it into two equal parts, running across from north to south, and extending as far as Cape Comorin. Many of the mountains produce diamonds, rubies, amethysts, granates, crysolites, jasper, agate, &c.

S E C T. II.

Natural History.

THE great chain of mountains mentioned above seems to be a barrier, erected by nature, to separate the seasons; for the countries that are divided by them, though under the same latitudes, have a different climate, and while it is summer on one side of these mountains, it is winter on the other; though all that is meant by winter in this country is, that time of the year when the clouds, which the sun attracts

from the sea, are violently drove by the winds against the mountains, where they break and dissolve in rain, accompanied with frequent storms: hence the torrents, which rush from the mountains, swell the rivers, and overflow the plains: hence, too, the vapours which obscure the day, and diffuse a gloom over the country.

When the fair season closes, the earth appears as one continued desert, except indeed that the trees never lose their verdure; but the rains no sooner descend, than the earth appears almost immediately covered with grass and herbs. It is a rule here, that they have the fairest weather when the sun is at the greatest distance from them, and the worst when it is vertical. The soil of this country is rendered so pliable for its various productions, by the excessive, but nourishing rains, that it needs little assistance from the hands of the husbandman. The earth

“ Its bosom does display,
“ Oppress’d with riches, and profusely gay:
“ Where Nature throws her gifts with lavish hand,
“ And crowns, with flow’ry luxury, the land:
“ Fruits, rivers, meadows, groves, and airy plains,
“ Still echoing with the lays of swartthy swains,
“ Lovely confusion make, and charm the eye
“ With beautiful irregularity.”

In the southern part of the peninsula the natives live principally upon rice; indeed, scarce any thing else is sown there. In the northern part there is excellent barley and wheat, and they have good peas and beans. Their buffaloes, cows, and goats, supply them with milk in winter, with which they make a great deal of cheese.

Though the gardens of India are extremely pleasant, they do not produce any great choice of flowers; here is, however, a variety of fruit-trees, and what flowers there are, have a most elegant mixture of colours, though few of them have any fragrance. The fruits are mangoes, guavas, pomegranates, ananas, pine-apples, cocoa-nuts, oranges, lemons, limes, plantains, tamarinds, mulberries, &c. There are, in the north part of the empire, also apples, pears, and other fruits that are produced in Europe. Both fruit and forest-trees in the south part of India are ever-greens, and some of the fruit-trees have green and ripe fruit on them at the same time. Their kitchen gardens yield water-melons, pot-herbs, potatoes, &c. They have also ginger, saffron, turmeric, sugar, cotton, indigo, opium, pepper-plant, &c. with spacious plantations of sugar-canes.

The cocoa and cotton trees are the most useful of any in India: the cocoa yields meat, drink, and oil, as well as timber for building: of the fibres of the bark they make their cordage, and with the branches they cover their houses. From the cotton-tree they have their calico, and most of their cloathing; this tree grows to a considerable height. There is also the cotton shrub, of which are made gingham, muslin, &c. The shrub and tree put forth yellow blossoms, succeeded by pods, the skin of which bursting, discovers a fine, soft, white wool. The banian is a most valuable tree, and grows to a considerable size; some of its branches shoot horizontally from the trunk, and from those branches slender twigs shoot downwards perpendicularly, and, taking root, form other bodies, which, like pillars, support the arms they sprang from; and thus one tree comes to have several bodies, covering a great space of ground, and sufficient to shelter at least twelve hundred people beneath its extensive branches. These trees are even converted by the natives into temples; their shade is the repository of their idols, and beneath the branches their enthusiasts exercise on themselves the strictest severities.

Among other fine and valuable trees here, is the indigo tree, or shrub, which is about the size of a rose-tree, but has a smooth rind. The leaves, when stripped off at the proper season, are laid together, when a vegetable dew exhales from them. They are then immersed in water, contained in vessels adapted for the purpose. After the water hath extracted the blue from the leaves, it is drained off: the sediment is then exposed in broad shallow vessels to the sun beams, through the heat of which

which the moisture evaporates, and the indigo itself remains in cakes at the bottom.

Among the animals of India, oxen are of great utility, either for draught or carriage: though not so large as ours, they make much greater speed, travelling thirty miles a day, and more. Ten thousand of these animals are sometimes seen in a caravan. By a caravan we mean a prodigious number of oxen, camels, or other beasts of burthen, loaded with merchandize. Their drivers have never any fixed habitation, but take their families with them. Each caravan has a captain, who is particularly distinguished by wearing a string of pearls round his neck, and receives singular homage from all ranks of people. The caravan drivers are divided into four classes, each class consisting of 80, 90, or 100,000 persons. These are attended by their priests, and each morning, before they set out, they pay their usual devotions to some idol. One caravan carries barley, another rice, a third pease and beans, and a fourth salt. Ten or a dozen oxen are generally employed in drawing a wagon, and two in drawing lighter carriages. When they bait, they are fed with grass, if it can be got; but there is little of this to be had in the south of India in the fair season, which is the proper time of the year for travelling, in which case they substitute fodder. The whole company sleep in tents, except those appointed as sentinels.

Camels are but seldom used here, being inferior in utility to oxen. Those they have, differ but little from the Arabian camels, which have been particularly described in Chap. VIII. Sect. IV. p. 77. of this work.

The elephant is the largest quadrupede in the universe: it is in height from 12 to 15 feet, and in breadth about seven. Its skin, except about the belly, is so tough, that a sword cannot penetrate it: it is of a darkish colour, and very much scarified: its eyes are exceeding small; its ears large; its body round and full, the back rising to an arch; and on each side of its jaws, within the mouth, are four teeth, or grinders, and two teeth project outwards: in the male they bend downwards, and are strongest; in the female they turn upwards, and are sharpest; both male and female use one which is sharp, as a defensive weapon, and the other, which is blunted, to root up trees and plants for food. The teeth of the male sometimes grow to the length of ten feet, and have been known to weigh three hundred pounds each. The teeth of the female, though less, are the most valuable ivory. They naturally shed their teeth once in ten years, and bury them carefully in the earth, to prevent their being found by man, as is generally imagined. The elephant's tongue is small, but broad; the feet are round and ample; the legs have joints which are flexible; the forehead is large, and rising; the tail resembles that of a hog; and the blood of this animal is colder than that of any other: but the organ which most peculiarly distinguishes the elephant, is its trunk. This singular member is crooked, gristly, and flexible, about seven feet in length, and more than three in circumference towards the head; but it gradually diminishes to the extremity. At the root, towards the nose, are two passages, the one into the head, the other to the mouth; through the first it breathes, and by the latter it receives its provisions, the trunk serving the purposes of a hand to feed it, and a weapon to defend it. It is so strong, that it can lift a prodigious weight, and so delicate in the sensation of feeling, that it can take the smallest piece of coin from the ground.

There cannot be a finer description of this unwieldy animal, than what we find in the sacred writings, where the elephant is termed Behemoth, which word, in Hebrew, implies "the collective strength of many beasts."

"Behold now Behemoth, which I made with thee; he eateth grass as an ox. Lo, now, his strength is in his loins, and his force is in the navel of his belly. He moveth his tail like a cedar: the finews of his bones are wrapped together: his bones are as strong pieces of brass; his bones are like bars of iron. He is the chief of the ways of God; he that made him, can make his sword to approach unto him. Surely the mountains bring him forth food, where all the beasts of the field play. He lieth under the shady trees in the covert of

the reed and fens. The shady trees cover him with their shadow. The willows of the brook compass him about. Behold, he drinketh up a river, and boasteth not; he trusteth that he can draw up Jordan in his mouth: he taketh it with his eyes; his nose pierceth through snares." Job xl. 15, &c.

The above passage is thus elegantly paraphrased by the celebrated Dr. Young:

Mild is my Behemoth, though large his frame;
Smooth is his temper, and repress'd his flame,
While unprovok'd. This native of the wood,
Lifts his broad feet, and prowls abroad for food:
Earth sinks beneath him, as he moves along,
To seek the herbs, and mingle with the throng.
See with what strength his harden'd joints are bound,
All over proof, and that against a wound
How like a mountain cedar moves his tail!
Nor can his complicated sinews fail.
Built high and wide, his solid bones surpass
The bars of steel; his ribs are ribs of brass;
His port majestic, and his armed jaw,
Give the wide forest and the mountain law.
The mountains fear him; there the beasts admire
The mighty stranger, and in dread retire:
At length his greatness, nearer they survey,
Gaze in his shadow, and his eye obey.
The fens and marshes are his cool retreat,
His noon-tide shelter from the burning heat;
Their sedge bottoms his wide couch are made,
And groves of willows give him all their shade.
His eye drinks Jordan up, when fir'd with drought,
He bursts to turn its current down his throat;
In listen'd waves it creeps along the plain;
He sinks a river, and he thirsts again.

The food of the elephant is roots, leaves, grass, shrubs, &c. but he is fond of corn when he can get it, and will drink wine to intoxication. The female goes two years with young, brings but one at a time, which continues growing till it is 30 years of age, and is exceedingly fond of her progeny; in croalling a river the dam takes up her offspring with her trunk, and carries it safely over. It is remarkable that the female is the strongest and most courageous; but the male is the largest and most graceful. The docility and sagacity of this animal are universally acknowledged; though able to encounter the most strong, it may be brought to be managed by the most weak; its sensibility is such that it expresses gratitude for those who treat it kindly, and always evinces a spirit of resentment against such as behave to it with indignity. Its eye, though small, is expressive and penetrating; it is fond of music, and exhibits tokens of the utmost satisfaction, when it hears the sound of any musical instrument; its sense of smelling is exquisite, but in the sense of feeling it is supposed to exceed all other animals.

The elephant, when tamed, may be taught many things, by which it is rendered both useful and entertaining. It travels quick with a great burden, and when trained to war, will carry upon its back a wooden tower, containing men, ammunition, and provisions. In the fortification, which it bears, a cannon is often planted, and it will stand the firing of it without the least trepidation.

Pliny, and many ancient writers, have given various instances of the uncommon sagacity of this animal, which the observations of modern travellers seem to confirm; in particular, captain Hamilton relates in his account of the East Indies, that an elephant pushed his trunk into the windows of a tailor's workshop, when one of the men ran his needle into it, which so highly affronted the animal, that he went to a neighbouring brook, and having filled his trunk with water, returned to the shop, spouted it in at the window, and washed all the tailors from off the place where they sat working. Evidently shewing, that he had sense sufficient to comprehend an indignity, and spirit enough to resent one, joining at the same time humanity with his anger, and giving his revenge a ridiculous instead of a tragical turn. To conclude, the celebrated Mr. Pope seems

per-

perfectly to acquiesce in the opinion of this animal's near approach to rationality in these lines :

"How differs instinct in the grov'ling swine,
"Compar'd half reasoning elephant with thine.

Sheep, asses, buffaloes, &c. are here in plenty. In the southern parts are sheep, which have a reddish hair instead of wool, and are much thinner and longer legged than ours; their flesh is very dry and coarse: fine Persian sheep however are brought into India, with good fleeces, and tails weighing several pounds. They have plenty of goats, and their kids are pretty good food. The hogs here, particularly the wild ones, are looked upon as the best butchers meat in the country. Antelopes, deer, and hares, are here in great numbers, and people have full liberty to hunt them whenever they please. Among their wild beasts are leopards, tigers, wolves, monkeys, &c. There is also the jackal, commonly called the lion's provider, from an opinion that it rouses the prey for that animal: the truth is, every creature in the forest is set in motion by the cries of the jackals, which run about in companies at midnight, making so dreadful an howling as to terrify other animals; when the lion, and other beasts of rapine, attending to the chase by instinct, seize those timorous animals which fly from the noise of this nightly pack, which are said to be of the size of a common fox, and to resemble that animal in the hinder parts, especially the tail, and the wolf in the fore parts, particularly the nose: its legs are shorter than the fox's, and its colour is a bright yellow; it has the ferocity of a wolf, and at the same time the familiarity of a dog: its cry is between howling and barking, and its voice doleful like that of human distress. These creatures often go together in packs of 40 or 50, or 100 or 200 together, hunting like hounds in full cry from evening till morning, and will sometimes make their appearance in towns and villages: thus united, they destroy flocks and poultry, ravage gardens, and even attack children that are unprotected. When they cannot obtain living prey, they subsist upon roots, fruits, and carrion. They will voraciously take up the dead from their silent graves, and feed on the putrid flesh; they are constant attendants upon caravans and armies, expecting that death will supply them with a feast.

The tigers here are a kind of cats of the forest; their heads resemble those of a cat, and they never pursue their prey fairly; but, on perceiving it at a distance, they lie down close in some cover till the object approaches which they intend to seize, and then jump upon it with all imaginable fury and eagerness. The tame leopard is used for hunting, and will follow its game into any water.

There are amphibious animals called alligators, particularly in the channels of the Ganges; some of these are twenty feet long, with their backs armed with impenetrable scales, and will swallow a man at a gulp; he pursues his prey as well upon land as in water; his body, however, being of so great a length, he turns with great difficulty, and a man may easily avoid him.

There are all kinds of poultry in India; but the flesh is not so good as the European. Here are great numbers of vultures, and white headed kites, which the banyans hold in high estimation, and pay them religious honours. They have no great variety of finging birds in India; but they have bats nearly as large as kites.

The happiness of living in so agreeable a part of the globe as India, would be considerably greater than it is, were it not for the swarms of troublesome insects and reptiles. The musketoes or gnats will seize upon a person, on his first landing on shore, and in a night's time swell a man's face and head so much, that his friends shall hardly know him: when an European however has been some time in the country, he does not suffer by them so much; their stings have not then an equal effect: but, however, they are at all times so troublesome, that people keep flaves on purpose to brush them off, especially in the season of sleep and retirement. Bugs are here also in swarms; but indeed these are avoided by tazing the feet of the couch on

which people repose themselves, for they cannot crawl over the tar. House scorpions are here both troublesome and dangerous; they are about as thick and as long as a man's little finger, and shaped almost like a lizard; their stings are not mortal, but cause the most excruciating pain, inasmuch that the person stung is almost deprived of his senses while the pain lasts; if the least dust be left in the corner of a room near the ceiling, these creatures will get into it, and drop upon the couches that people sleep on; they carry their stings open at the end of their tails curled upon their backs. Snakes will likewise get into rooms or warehouses, and suddenly dart at people. There are various kinds of snakes and serpents in India, and the cobra-capelle, or hooded-snake, is extremely beautiful, though his sting is as dangerous. It will spread its head as broad as one's hand, and at that time discovers a kind of human face. The jugglers and merry-andrews of the country carry several of these reptiles in baskets, and on finging to them, and playing some instrument, the snakes raise the upper parts of their bodies, and keep time with music by the motion of their heads. These reptiles are first drawn from their holes by means of a musical instrument somewhat like a flageolet; so powerfully does the music operate on them. This might appear fabulous, was it not authenticated by persons of veracity and character.

There is a little green snake, which will dart from tree to tree, where the trees stand thick; whence some people have given them the appellation of the flying serpent. The centipede is no other than what the French call cent-pied, and the English wood-louse: it is obvious that it receives its name from its great number of legs; its sting or bite is as dangerous as that of the scorpion. Frogs, toads, and rats grow here to a considerable size; the rats are at least three times as big as ours, and are very daring; they will sometimes scarcely suffer a person to pass. There is, however, one species of rats, called the musk-rat, covered by a soft white down. It is naturally very inoffensive, and obnoxious only on account of its spoiling wine and tea by its infectious breath, which it effects by running over the boxes of the first, and gnawing the corks from the bottles of the latter.

Many parts are greatly infested by swarms of ants, which are particularly destructive to cloaths, furniture, and even buildings.

As to fish, the seas abound with them: among these are dolphins, bonitos, and albacores; the former has not the faintest resemblance to the descriptions of that fish as given by our painters; it is as frait a fish as any that swims, and has a bright golden colour, appearing through the groundwork of a beautiful azure that is mixed with it; the fish, however, is no sooner out of its element than its colours begin to fade. They are commonly about a yard in length, and swim at the rate of about eight or nine miles in an hour; the flesh is white, and has a very good taste. The bonito is a firm but dry fish, and requires a good deal of sauce to make it palatable. The albacore is nearly of the same kind as the bonito, but grows to a much larger size; some weigh from 50 or 60 to 100 pounds, and are still drier eating than the bonito. These three fish pursue the flying fish, which spring out of the water on being pursued; and the large size of the side-fins of the latter have given birth to an opinion that they are assisted by them in the spring which they make out of the water: when their fins are dry, they drop into the water again, and then take another flight; and this they repeat till they entirely escape from the enemy, or are destroyed. They are about the size of a large herring, and are a good-tasted fish. There are whittings, and a fish like the bream, though much larger; there is also the bald-pate, a palatable fish, and which hath its name from its having no scales on either its head or neck. The raven-fish is so called from its mouth bearing resemblance to the bill of a bird.

Here are some sharks from 12 to 20 feet long: in calms they are generally found in the open sea, when they follow ships a great way. A single blow from the tail of a shark, would break a man's leg: when

N a drawn

drawn to the side of a ship, by means of a strong hook, a man cuts off his tail with an axe, else much damage might ensue. The shark hath a triple row of teeth as sharp as razors; but as he does not swim more than two or three miles an hour, it is not difficult to avoid him. When a bait is thrown out for him, fixed to a strong hook, two or three fish, called pilot-fish, and which are very beautiful, swim before him, and crowd about the bait; they then return to their master, as if to advise him on the expediency of taking the bait. If he comes to it, he turns on his back, takes in the bait, and the hook strikes into his jaws. The reason of his turning on his back is, that his upper jaw is so much longer than his lower one, that he cannot take in the bait without thus turning. The pilot-fish are looked upon as the nicest fish the seas produce; they rarely take a hook when in company with a shark; but when they part from him, they will sometimes bite, and be caught. These fish, which are about a foot and an half in length, are transversely streaked with blue, and a kind of yellowish brown, which hath a most beautiful appearance in the water; they, however, when taken out, lose much of their lustre.

On the coast of India are many sorts of shell-fish, particularly oysters, which are little inferior to those caught on the coasts of England.

SECT. III.

A particular account of the inhabitants, their habits, manners, customs, ceremonies, &c.

THE Indians are of a middle stature, and good features. The inhabitants of the northern part are of a deep olive colour, and those in the south black; the natives, who dwell on the mountains in the centre of the peninsula, are exceedingly black: all have black eyes, and long black hair. The women, by their symmetry, deportment, and charming features, captivate every European that beholds them.

The men wear white vests, girt with a sash; some are of silk, some of muslin, and some of cotton; the sleeves are very long; and the upper part of the garment is contrived to fit so as the wearer's shape may be seen. Under this is another somewhat shorter, and their legs are covered by their breeches; they wear slippers peaked like women's shoes, into which they put their bare feet. Their hair is tied up in a roll, over which they have a small turban.

The women have a piece of white calico tied about their waists, which reaches to their knees, and the rest is thrown across their shoulders, covering their breasts, and part of their backs. Their hair, like the men's, is tied up in a roll, and is adorned with jewels, or toys in imitation of them; they have pendants in their ears and noses, and several strings of beads round their necks; they wear bracelets on their wrists and ancles, and rings on their fingers and toes; they put their bare feet into slippers as the men do; though indeed in the southern parts some of the women wear no slippers or shoes at all.

The Moors, or Mahometans, appear in a very handsome and becoming dress; they have grand turbans of rich muslin, and their garments reach down to their feet; their dresses are embroidered in great taste, the ends being decorated with gold and silver tissue: in their dresses they stick their daggers; and they wear embroidered slippers, which they take off, and leave at the foot of a sofa when on a visit.

They are remarkably fond of smoking tobacco, and use the calash; their method of doing which has been particularly described in Chap. VII. Sect. IV. p. 63. The poor roll up a leaf of tobacco, about four or five inches long, and lighting it at one end, smoke the others, till it is about half exhausted, and then throw it away.

The inhabitants of Indostan resemble in manners the other natives of Southern Asia: they are effeminate and luxurious, and are by education taught to affect a grave deportment. This naturally initiates them early in the arts of dissimulation; so that they can carelessly those whom they hate, and even behave with the utmost affability

and kindness to such as they intend to deprive of existence by the most sanguinary means. Many of them might justly say,

"Why, I can smile, and murder while I smile,
"And cry content to that which grieves my heart;
"And wet my cheeks with artificial tears,
"And frame my face to all occasions."

From this mode of education, they seldom scold or wrangle, but often stab each other invidiously, and, without having any public quarrel, gratify a private revenge.

Their method of saluting each other is, by lifting one or both hands to the head, according to the quality of the person saluted; but they never salute with the left hand singly. When they meet, they say, "Salam Alacum; God preserve thee;" the reply is, "Alacum Salam; God also preserve thee." The salutation of a prince is bowing the body very low, putting the head to the ground, then to the breast, and afterwards raising it to the head; this is repeated thrice; and some fall on their faces before a prince. An elegant modern writer observes, "That sometimes, to shew greater awe and deference, they throw themselves into a fit of trembling, as if they were shaken by an ague; but this last piece of mummery is reserved for great occasions. In short, there is no posture too base, no language too humble, no submission or flattery too gross, to be given to those they fear."

In visits among friends, the master of the house never gets up to receive his visitor, but requests him to sit down by him on the carpet, for their floors are spread with rich carpets; betel and areka are then offered him to chew, which, as in the neighbouring countries, they have almost continually in their mouths: they fit and chew together, but talk very little; they play at cards sometimes, but never game so high as the Chinese; nor are they out of temper when they lose.

When the Indians give a public entertainment, they send for a number of dancing girls, who entertain the company with a variety of dances, and perform plays by torch-light in the open air, which they execute with great judgment. They embellish their necks with caranets, their arms with bacelets, and their ancles with small golden or silver chains: in their noses they wear jewels; and some of them form black circles round the white of the eye, which they think heightens its natural lustre.

The Mahometans ride upon elephants, horses, and in palanquins. A palanquin is a kind of couch, covered with an arched canopy, and hath cushions, quilts, and pillows; it hangs upon bamboo, and the person in it may either sit upright, or loll at his ease: the bamboo, or hollow cane, is about five or six inches diameter, and about ten feet long, which, having been bent whilst young, grows in the proper form of an arch to support the canopy. The palanquin is commonly carried by four men, two before, and two behind, by means of poles, the ends of which they place on their shoulders. Those in which the ladies ride, are covered with a silk netting of different colours, that entirely prevents their being seen by any person: this is done by order of their husbands, who are naturally very jealous.

The hackrees are in common use, and are drawn by oxen, who will go on a brisk trot like horses, having been properly trained. These hackrees are open on three sides, covered at the top, and hold two persons with pillows at their backs for the indulgence of lolling: the driver sits upon the shaft, and goads the oxen, which in general are white, with their horns painted black by way of contrast. These vehicles are used chiefly by the Gentoos, especially the banyans, and merchants of Surat.

There are also andolas and donlies, which are in the same form and make as the palanquins, though inferior.

None but the Mogul himself, the princes of the blood, and great men, ride upon elephants, which are most richly and grandly caparisoned; and here it must be observed, that the animal appears always delighted with the finery of its trappings.

The best horses used in India are brought from Persia and Arabia, and the Mahometans take great care of them.

Their houses are of two kinds, those built by the Moguls, and those by the original Indians. The houses of the Moguls are all in the Persian taste; in short they seem to imitate the Persians in every thing; like them, they are fond of having elegant gardens, with pavilions, fountains, cascades, &c.

As the Gentoo inhabitants throughout the empire are twenty or thirty to one of the others, most of the principal towns consist of the habitations of the former, which are for the most part very mean: in front of these houses are sheds on pillars, under which the natives expose their goods to sale, and entertain their friends or acquaintance: there are no windows opening to the streets; and even the palaces of their princes have no external elegance. The apartments in the houses of the wealthy are ornamented chiefly with looking-glasses, which are purchased of the Europeans, and many of their ceilings are inlaid with mother of pearl and ivory. The private rooms are always in the back part of the houses, for the better security of the women, so meanly jealous are the men.

The Moguls and chief Mahometan courtiers have their seraglios or harems well supplied with handsome women; and so jealous are they, that they confine them very close, and follow the usual Asiatic method of committing them to the guard of eunuchs: thus are frequently sacrificed numbers of young beautiful creatures to the caprice and jealousy of one man.

The Mahometans have public hammams for bathing, cupping, champing, &c. champing is chafing and rubbing the limbs of a person, and causing the joints of the wrists and fingers to crack, in order to procure a brisk circulation of the blood.

The Indians marry in their childhood; and some of the higher ranks of the Gentoos have the privilege of having several wives. The little bride and bridegroom are carried through the streets, dressed in the most elegant taste, for several successive nights, the houses being at the same time illuminated. They are preceded by their relations and friends, with music playing, and streamers flying. They all proceed to the house of the bride's father, and the little couple being seated opposite to each other, and separated by a table, they reach out and join their hands across the table, when the priest puts a sort of hood upon the head of each, and supplicating heaven to prosper them, gives them the nuptial benediction.

Wives begin to bear children at the age of about twelve, and treat their husbands with the most profound respect, affection, and tenderness. They are entirely in the power of the latter, and bring them no other dowry than their wearing apparel, and perhaps a few female slaves; they, however, enjoy much greater freedom than the wives of the Mahometans; at least those do who are married to tradesmen and mechanics. The Bramins and Banyans generally content themselves with one wife; though the other tribes of Gentoos often take more. Among some of the natives, or nobles, prevails the strange custom of one wife being subject to several husbands; the number is not so much limited by any specific law, as by a sort of tacit convention, by which it rarely exceeds half a dozen. The husbands cohabit with her alternately, according to priority of marriage; and each, on going respectfully to her, leaves his arms at the door, as a signal that none of the others must presume to enter.

An infant, at the age of about eight or ten days, receives its name from its aunt, or, in her absence, from its father or mother: in about a month afterwards it is taken to a pagoda, where a bramin crowns its head with cloves, camphire, and sandal-wood, and the child becomes a Banyan complete.

The wife who has more husbands than one, and who brings forth a child, nominates its father, who is at the expence of educating it; but from the impracticability of assigning the real heir, the estates of the husband devolve to the children of their sisters, or others near in blood.

As to the funeral rites of these people, some bury the bodies of the deceased, and others burn them on piles; the latter is the most customary. Before they burn their dead, they carry them on a bier to a small distance from the town or village where they died, dressed in their usual wearing apparel. Here a pile is erected, and the corpse placed upon it; and as soon as the bramin has done praying, one of the corners of the pile is set fire to. When the body is consumed, its relics or ashes are gathered, and thrown into the sea by the bramin; for the funeral pile is always erected near the sea or some large piece of water. Some persons, on the approach of their dissolution, request that their ashes may be put into an urn, and carried to the Ganges.

The person who sets fire to the pile is always the nearest male relation, who walks bare-headed, in a coarse tattered garment (their common mourning) round it three times before he places the fire-stick; and when the whole is in a blaze, he appears distracted with the most agonizing grief.

The distinguishing and supreme characteristic of the Indian married ladies, is fidelity to their husbands. Some of the wives of the bramins have even burnt themselves, in consequence of the death of their husbands; though perhaps it may be said that the injunction of the laws, more than sentiments of affection, occasioned such sacrifice. However, in answer to this, we shall remark, that numbers of women have burnt themselves who were under no such kind of injunction, but who were influenced merely by a point of honour, and a most sacred regard for their husbands.

The above most dreadful and pernicious sacrifice is said to have originated from the practice of burning Gentoo wives for poisoning their husbands; but this perhaps may not be the case, as the law recommends a voluntary sacrifice. The first wife (the Gentoo laws allowing bigamy) has a limited time given her to consider whether she will burn herself or not; if she declines it, the choice is given to the second; if the second declines also, the consequence is, they both lie under the imputation of being remiss in the genuine principles of honour and esteem. Some have been so bigotted as to devote themselves whole years to the lowest and most laborious employments, in order to raise a sum of money to defray the expences of a pompous burning execution of themselves; others have been more eagerly ambitious of sacrificing themselves, in proportion as scenes of this kind became less common; however, when their approaching fate appeared with all its horrors, they were seized and agitated with tremor; inasmuch that certain mixtures were given them, to stupify their senses; for it was now too late to recede; on the pile they were obliged to go; and as soon as the flames reached them, music struck up, to drown the noise of their screaming, while the spectators joined in shouts of approbation. There have been instances, however, of women who have been animated with the most extraordinary enthusiastic intrepidity. About the year 1743 the widow of the Rhaam Chund Pandit, in her 17th year, signified to the bramins her resolution of burning herself; the dreadful pain of the death she fought was delineated to her in the most expressive colours; all, however, had no effect; she even put her hand into a fire, and held it there some time. Her friends finding her so determined, consented to a funeral pile being erected; the melancholy hour approached; she took leave of her mother and three children, divested herself of her ornaments, walked three times round the pile with the Bramins, from whom she received a wick of cotton, and taking one more tender farewell of her children, &c. ascended the pile, and set fire to it.

It is necessary to observe here, that the body of the above lady's husband, Rhaam Chun Pandit, who was in the 29th year of his age when he died, was consumed on the same pile with her. When she advanced on the pile, she seated herself by him, and, after looking steadfastly at him, in a few minutes set fire to the pile; but discovering that the flames blew from her, she, with an astonishing resolution, set fire to it in a fresh place, when the whole was soon in a blaze.

Another lady, not many years since, aspired to the honour

honour of burning: she was a native of Surat, and was remarkably beautiful: she became a widow at about 19, and intrated to consign herself to the flames: the governor, however, refused to grant her permission; upon which, snatching up a handful of red-hot coals, she exclaimed, "Consider not my youth, my beauty, or my wealth! see how courageously I grasp this fire! judge then with what avidity I should embrace a funeral pile!"

In *The Sailor's Letters*, written by captain Thompson to his friends in England, there is the following account of a lady's burning herself:

"The respect the women pay to their dead husbands will stagger the belief of every unmarried lady, when told they burn themselves with the bodies; but of late years it is much abolished, and utterly forbidden within the jurisdiction of the English factory. Two days ago I was present at one of these cruel scenes, when the sweetest widow of twenty was sacrificed to the manes of an old husband. The procecion was trifling; and though all appeared in smiles, yet a solemnity reigned through the whole. In the front of this living funeral advanced her three daughters (pretty creatures of from five to nine years old) next her only son, then a band of harsh music, and lastly the widow, followed by her friends and kindred. She was dressed in her gayest apparel, and adorned with jewels, gold and silver trinkets, &c. The funeral pile consisted of aromatic woods dipped in gums; it was five feet high, and on the top was extended the dead body of her husband. As soon as she arrived, she took an affectionate leave of all her friends, and lastly her babes, who parted with smiles; but I own I thought the boy would have shaken her constancy, dwelling some time about her neck, which the priest perceiving, interrupted her; the church receiving profits from such horrid catastrophes. She then stripped herself of all her ornaments, giving something to all, and with the most unshaken courage mounted the pile; taking the head of the dead body in her lap, and a jar of oil in her hand, which, as soon as the fire was kindled, she poured over her head, and without a sigh, tear, or emotion, expired in an instant, whilst the crowd filled the air with acclamations of joy."

The institution of the above horrible sacrifice is not ascribed to Bramas, but seems rather to be the invention of some bramias who carried his jealousy beyond the grave: it is a piece of refinement dictated by a barbarous and over-strained affection, and suitable to the character of those superstitious beings who think there is a particular merit in rigid morality, or what they stile a transcendent purity of manners.

Since the Moguls, however, became masters of Indostan, these shocking spectacles have been much less frequent than formerly.

As to their food, both Mahometans and Gentoos eat rice stewed till it is quite dry; this they eat as we do bread. A favourite dish with them is what they call pilaw; it is a fowl boiled with rice, and seasoned with turmeric. Another dish is the curree, which is a sort of fricassee of animal food or vegetables; and another is the kitcharee, which is rice stewed with a sort of pulse, and is eaten commonly with pickles of different kinds. They never use any knives, forks, or spoons, but eat with their fingers only: they always wash their hands both before and after meals, and use only the right hand in eating. Water is their common liquor; they also drink the milk of the cocoa-nut. As to beer, ale, or wine, there is not a drop of either of these liquors made in India; they buy all of the Europeans. They have spirits of several sorts, which they call arrack, some of which is distilled from sugar, and some from rice; the latter is drank chiefly by the common people. These Indians are in general very sober, and some of them abstain from all animal food; the bramias in particular never eat any thing that has had animal life; currees of vegetables are their common diet, the chief ingredients of which are turmeric, spices, and the cocoa-nut pulp.

The inhabitants of Indostan are some of the most inactive and indolent people in the universe.—They often repeat an antient maxim, which is expressive of

their favourite foible, and may be thus paraphrased in English:

Better be silent, than to talk;
Better to sit by far than walk;
Lying, you'll find will better please,
Than sitting, if you love your ease:
Better to sleep than lie awake;
But best — existence to forsake;
For death concludes the cares and pains
Which busy active life maintains:
Let me be indolent, or free
From living, bustling misery.

The natural indolence to which the people of this country are accustomed, may in some degree be accounted for, from the excessive heat of the climate, which prevents them either from pursuing business or amusement the chief part of the day. The only times they can follow these are, the early part of the morning, and the latter part of the evening, so that they are obliged to rise early, and sit up late. All ranks of people, even the most menial servants, retire to rest after dinner; and from that time till near sun-set, every thing is as silent as at midnight; after which they dress and recreate themselves according to their respective stations.

SECT. IV.

Antient and present state of learning in India, languages, &c.

WE may trace the origin of most of the sciences in this country. Even before the time of Pythagoras, the Greeks travelled into India for instruction. The native Indians, or Hindoos, are men of strong natural endowments, though they have but little literary knowledge; they have, however, some of Aristotle's works in the Arabian language, as well as those of Avicenna, and some passages in the Old Testament. The Gentoos, or original Indians, begin their year on the first day of March, and the Mahometans on the 10th, and their year is composed of thirteen moons. The day they divide into four parts, and the night into four, which they again subdivide into eight, and measure them by water dropping from one vessel into another. In some of the principal towns there is a large vessel fixed, which a person constantly attends.

The bramias are adepts in arithmetic, at least in the practical part; in their childhood they are instructed to cast up sums by their fingers only. They have tables for calculating the approach of an eclipse, but are no theorists in their calculations. On the day of an eclipse, they bathe in water, from an opinion that this purges away their sins. Though they are acquainted with the signs of the zodiac, they think that the moon is above the sun, though the contrary be demonstrated in an eclipse; and that the sun, when it sets, is hidden behind some cloud; so little notion have they of the globe's being spherical. Astrology is their grand and favourite science; and the Indian bramias are the almanack-makers, who mark down what they prophesy will be lucky or unlucky days; and so infatuated are the Gentoos, that their merchants will transact no kind of business on the days predicted to be unlucky.

The Indians have very little skill in physic and anatomy. The bramias use charms for the expulsion of disorders; they, however, at the same time apply simples, and with good success: they allow no liquor but water, mixed with cassia, lignum, or cinnamon.

The morchechin rages sometimes on the coast of Malabar; the patient is seized with a violent vomiting and purging, attended with an acute pain in the intestines. The cure for this is a red-hot iron applied to the soles of the feet.

The Indians are subject to the bloody flux, which they cure by the prescription of stewed rice.

Various are the languages and dialects spoken in India. The language spoken at court is the Persian; what is deemed the learned language is the Arabian; but none is so generally understood as the Portuguese, though much corrupted. Indostan, incorporated with a great many Persian and Arabic words, is spoken throughout

throughout Indostan and other parts of India, though the accent and dialect differ in the several places where it is spoken; the purest is spoken in the province of Agra.

The Gentoos write with a reed, or calamus, on a fine transparent paper: in some parts they write with a fine bodkin on the leaves of the cocoa, or palm-tree.

The game of chess was invented here: we owe to them the use of cyphers, which, though imported among us by the Arabians, came originally from India. The ancient Indian medals, in such esteem among the Chinese, prove that the arts were cultivated in India, even before they were known in China.

SECT. V.

Religion of India in general, and the different Sectaries in particular.

NOTwithstanding the sacred books of the Indians do not produce those instances of the marvellous, which sometimes strike so forcibly in the Greek theology, their mythology is very irregular. The religious and philosophic books of the Hindoos, are called Bedas, which they say were formed by God himself. They are written in Shanferita, a language known only to the Bramins, who confine those writings entirely to their own tribe, and have the general term of Vedam. One of these books teaches, that the Deity being absorbed in the contemplation of his own essence, formed the resolution of creating beings, who might participate of his glory. He spoke, and angels rose into existence, who in concert chaunted the praises of their God; harmony reigned in the heavenly regions, when two of these spirits revolting, they drew a legion after them. The Almighty then drove them to a place of punishment, from whence they were released by other angels interceding for them, upon conditions, which at once inspired them with both happiness and terror. The revolting spirits received sentence, under different forms, to be punished in the lowest of the fifteen planets, in proportion to the heinousness of their first crime; accordingly each rebellious angel underwent eighty-seven transigrations upon earth, before he animated the body of a cow, which holds the first rank in the animal tribes, and which they venerate in the most distinguished manner. In some of the countries they do not suffer the openly killing of cows; it must be done in privacy, and the slaughter not talked of.

The eighty-seven transigrations of the angels, before each animated the body of a cow, are looked upon as so many stages of expiation, preparatory to a state of probation, which commences upon a transmigration from the cow's body to an human body. In this situation the Almighty enlarges the intellectual faculties, and constitutes a free agency; when good or bad actions hasten or retard the time of pardon. The good are at their death re-united to the supreme being, and the wicked begin afresh the era of their expiation. Hence it appears, that the metempsychosis is an actual punishment, and that the souls which animate the generality of the brute creation, are nothing more than wicked spirits. This explication, however, is not universally adopted in India; for the doctrine of transmigration seems to have been originally founded rather on hope than on fear. It was probably adopted only at first, as an idea which flattered mankind, and would with great readiness be embraced by men who, under the influence of a delicious climate, began to be sensible of the shortness of life. It must naturally be a consolation to a man

far advanced in years, to think he shall continue his enjoyments, and that his dissolution only prepares a passage to a fresh scene of existence.

There is reason to believe, that the Indians were almost as civilized when Brama instituted his laws, as they are at this time. It is from him the Indians derive their religious veneration for the two great rivers, Ganges and Indus; it was he who consecrated the cow, whose milk is so wholesome and agreeable in hot countries; and to him is attributed the division of the people into tribes; which institution is antecedent to all traditions and known records, and may be considered as the most striking testimony of the antiquity of the Indians. Throughout all Indostan, the laws of government, customs, and manners, form a part of religion, and are all derived from Brama, who was the interpreter of the divinity, and author, through immediate divine influence and direction, of the sacred books. He prescribed different sorts of food for the respective tribes: the military and some other ranks were allowed to eat venison and mutton; fish was allowed to some husbandmen and mechanics; and others lived upon vegetables and milk. The Bramins never eat any thing that hath had life. Upon the whole, these people are very sober and temperate. They divide past time into four distinct ages, and pretend to trace the existence of time through a vast succession of years. The four sacred books or bedas, contain an hundred thousand poetic stanzas, each consisting of four lines; the first treats of astrology, natural philosophy, astronomy, and the creation of matter; the second treats of religious and moral duties, and has sacred songs or hymns in honour of the Divinity; the third has for its subjects all religious rites and ceremonies, as fasts, festivals, penances, purifications, &c. and the fourth comprehends the whole science of theology and metaphysical philosophy. However, since the rise of the Mahometan religion, the Bramins have laid aside the fourth book or beth, as the heresy of Mahomet, according to them, hath been founded upon that book.

The Bramins will suffer no other sect to read their sacred books; they are bound by such strong ties of religion, to confine those writings to their own tribes, that were an individual among them detected in reading or interpreting them, he would at a certainty be expelled. The comments of the Bramins on the text, are the same as those which have always been on religious books; all the maxims which fancy, interest, passion, or false zeal can suggest, are to be found in these books. Priestcraft has taken such full possession of the people, that their consciences, actions, and conduct, in spirituals and temporals, are lodged in the breasts of the Bramins, and are at their disposal; for the heads of families are obliged to have one of these fathers in their houses, who never fails to exercise that unbounded influence which impostors and fanatics always exert over men who have not courage to consult either their own reason or their own feelings. In short, the people are mere mechanics, directed and moved at the caprice and pleasure of these fathers.

Among the Gentoos, about one-third of the year is set apart as holidays, which are either fasts or feasts dedicated to some of their gods, of whom they relate the most whimsical and absurd tales, and pretend that they frequently take a trip to the earth upon the most trivial occasions.

The principal deity or divinity itself is represented as having an infinite number of heads, hands, and eyes, which are emblematical of his knowledge, power,

From his yet reeking neck to draw the yoke,
That neck with which the surly clods he broke;
And to the hatchet yield thy husbandman,
Who finish'd Autumn and the Spring began.
From whence, O mortal men, this gust of blood
Have ye deriv'd, and interdicted food?
Be taught by me this dire delight to shun,
Warn'd by my precepts, by my practice won:
And when you eat the well-deserving beast,
Think on the labourer of your field you feast.
Let plough thy steers, that, when they lose their breath,
To nature, not to thee, they may impute their death.

O O

and

* It is imagined, that Pythagoras collected the materials with which he formed his system of the *Metempsychosis* from the religion of the Bramins, as may naturally be supposed from his great veneration for the steer, which he thus describes according to Ovid:

How did the toiling ox his death deserve,
A downright simple drudge, and born to serve?
O tyrant! with what justice can'st thou hope,
The promise of the year, a plenteous crop?
When thou destroy'st thy lab'ring steer, who till'd
And plough'd with pains thy else ungrateful field?

and penetration; and the inferior attributes are figured by almost every animal or visible object in the creation: in particular, wisdom is represented by a snake. But the ignorant, not content with one deity, have split their principal divinity into many thousand parts, and changed each attribute into a separate god.

There are upwards of eighty sects who support the religious tenets of Brama; in some fundamental points they concur, and never dispute upon any. They live in friendship with persons of all persuasions, and admit of no proselytes; they say heaven has many gates, and every one may enter at which he pleases.

As to the religion of the Mahometans here, it is the same as in Persia, and is the religion of the court; the Mahometan fanaticism, however, having subsided here to a degree of rationality and candour, all professions or religions here, through this means, are practised with freedom and tranquillity.

There is a sect among the Mahometans called Ahlaltahkik, or people of certainty, who believe there is no other God than the four elements; which, together with the world and all its vicissitudes, they assert to be eternal; and that mankind, as well as other things, are a compound of those elements, of which they are formed, and into which they return and are dissipated. This opinion is at the bottom the same as that maintained by the arch atheist Spinoza, who said the world was God, or the self-existent being; and that all particular beings, corporeal extension, the sun, moon, plants, animals, men, their motions, ideas, imaginations, and appetites, are all necessary modifications of that self-existent being.

The term Gentoos distinguishes the Hindoos from the Mahometans or Mussulmen, commonly, though improperly, denominated Moors. The word has its derivation from Gentio, in Portuguese, signifying Gentile.

The Hindoos are divided into four tribes, the first and most considerable of which are the Bramins; of these there are several orders: those who mix in society are for the most part very corrupt in their morals; they say that the water of the Ganges will wash away all their crimes; and, as they are not subject to any civil jurisdiction, they live without either virtue or restraint; except indeed that they have the great character of compassion and charity; principles eminently distinguishable in the mild climate of India. The others, who live abstracted from the world, are either weak-minded men or enthusiasts, and give themselves up to idleness, superstition, and metaphysical dreams. We discover in their arguments the very same ideas which occur in the writings of the most famous of our metaphysicians; such as immutability, indivisibility, the vital and sensitive soul, &c. and as this mode of reasoning was derived from the Greek philosophers, it is not improbable that the Greeks themselves might have borrowed this curious species of knowledge from the Indians; unless indeed we rather incline to conjecture, that as the principles of metaphysics lie open to the capacities of all nations, the natural indolence of the Bramins may have produced the same effect in India, as that of the Monks hath done in Europe; notwithstanding the inhabitants of one country had never communicated their tenets to those of the other. The Bramins are not excluded from government, trade, or agriculture, though strictly prohibited from all menial offices. These tribes are not allowed to intermarry, live, or eat and drink together. Whoever violates this rule is banished as a disgrace to his tribe. But it is quite otherwise when they go in pilgrimage to the temple of Juggenat or the Supreme Being. At this season the Bramins, the Raja, the husbandmen and mechanics, associate promiscuously, and make offerings; uniting, at the same time, in one general sentiment, that the distinctions of birth are of human institution, and that all share alike in the favour or blessings of the Almighty.

When an Hindoo is banished and disgraced, he is forced to join the Hallachores, who are a fifth tribe, or rather the refuse of all tribes; for they perform the vilest offices in life, and are held in such general abomination, that on the Malabar side of India, if one of them happens to touch a person of a superior tribe he

receives a dagger in his body, and the laws countenance the deed.

Many of the individuals constituting these tribes are overwhelmed with the most absurd and laughable fanaticism; some wallow in the dirt, others put themselves in painful attitudes, extending their arms over their heads till they are unable to recover their natural position; while others continue standing five or six days together, till their legs swell exceedingly; they enter unanimously into an agreement never to comb their hair, or wash their bodies; thinking, by thus disgracing nature, they obtain the pleasure and approbation of heaven. Such are the descendants of the ancient Brachmans, whom antiquity never speaks of but with admiration; because the affectation of austerity and mystery, and the privilege of declaring the will of heaven, have imposed upon the vulgar in every age. The Brachmans were looked upon as the friends of the gods, and the guardians of mankind; wherefore an unlimited veneration was paid to them; even princes consulted them on any momentous concerns, from an opinion that they were inspired.

The four tribes, or classes of Hindoos, are thus distinguished:

1. The Bramins, who received their name from Brinha. This class is the most noble, as it proceeded from the head of Brinha when he created the world. It is allegorical of their superiority over the other classes.

2. Sittri, or the Military. This class is said to have proceeded from the heart of Brinha, which derivation is said to be emblematical of the courage necessary to warriors.

3. Bicc, or the Trader. This class is figuratively said to have sprung from the belly, as trade supplies mankind with the necessities of life.

4. Sudder, or Labourer, which class is typified by having sprung from the feet, pointing out by implication the menial situation of those who belong to it.

The Harri, or Hallachore class or cast, are the refuse of both Mahometans and Gentoos, and their only employ the most base or menial offices. The people of this class, as they are excluded from all society among the Indians of every denomination, are glad to find refuge in the lap of any communion; they therefore turn Roman Catholics, and, indeed, there are few other proselytes that the missionaries can boast. It may from hence be presumed, that the black Roman Catholics in general are converts more from compulsion than inclination, and make a virtue of necessity when they change their religion. If a married woman commits some very atrocious crime, her husband immediately cuts off her hair, which is the greatest mark of infamy with which she can be branded. After such an ignominy, none will converse, or be connected with her; she therefore flies to a priest, and turns Roman Catholic, in order not to be totally excluded from society.

The Hindoos, or Gentoos, are considerably more numerous than the Mahometans. Avarice is their chief passion; a passion which prevails, for the most part, in persons of weak bodies and little minds.

The latest writer upon this subject, which we have seen, thus describes their character:

"To sum up their general character in few words; they are gentle, patient, temperate, regular in their lives, charitable, and strict observers of their religious ceremonies. They are superstitious, effeminate, avaricious, and crafty; deceitful and dishonest in their dealings, void of every principle of honour, generosity, or gratitude. Gain is the predominant principle; and as a part of their gains, bestowed in gifts to their priests, or charities to the poor, will procure their pardon, they can cheat without fearing the anger of their gods."

The division of the Gentoos into tribes or classes, discovers a striking peculiarity in their government and religion. The tribes are headed by a chief, who is in some degree responsible for the conduct of those under him; and individuals, on proper occasions, are sometimes summoned to assemble together, in conformity to the requisitions of government.

S E C T . VI.

Of the Government and Constitution, civil, military, &c.

THE authority of the Great Mogul is so extensive and despotic, that both the lives and fortunes of his subjects are wholly at his disposal. Civil slavery hath been here added to political slavery; the subject oppressed, has no law to protect him. Here a man scarce dares to think; his soul is so much debased, that its faculties are destroyed; disposition debases and stifles every kind of sentiment. The subject is not master of his own life; he is not master of his own understanding; he is debarred from all studies that are serviceable to human kind, and is only allowed such as are calculated to enslave him. He is not master of his own field; the lands, and their produce, belong to the sovereign; and the peasant must be contented, if he can earn just enough to keep himself and his family with a common degree of decency. He is not master of his own industry; every artist, who has been so unhappy as to betray his talents, lives in dread of being fated to serve the monarch, or some powerful courtier, who hath purchased a right to use and employ him as he thinks proper. He is not master of his own money; he is forced to conceal it in the earth, by way of securing it from the tyrannic hand of power. The will of the Mogul is the only law of his subjects; it decides all law-suits, without any person's daring to call it in question, on pain of being deprived of life. At his command alone, the greatest personages are put to death, and their possessions taken from their families. No doubt this absolute and tyrannical authority, with which the Indian is every where oppressed, must subdue his spirit, and render him incapable of those efforts which courage requires. The climate of Indostan is another obstacle to any liberal exertion; the indolence it inspires is an invincible impediment to great revolutions and vigorous oppositions, so common in the northern regions: the soul and body, equally enervated, have only the virtues and vices of slavery. Since then the climate hath so powerful an effect over both mind and body, its influence must bear a mutual analogy to the different heights of the soil on which a man breathes, independently of other local causes, which must make some exceptions to the general rule. This is a received opinion with regard to the vegetable system. In many instances, the height of the soil is determined by knowing the plants which grow upon it; and the height of soil being given, we may tell what plants it produces. These facts are generally admitted; for better observations have been made upon plants than men. But to return to our subject.

When the sun rises, the emperor of Indostan sometimes appears at a window, when all the great men of his court are obliged to attend in his apartments to do him homage. At sun-set he also appears at a window, and receives the acclamations of the people. The principal officers of his empire are the prime vizir, the first secretary of state, the treasurer, the chief of the eunuchs, the general of the elephants, and the master of the wardrobe.

No persons must presume to enter the imperial palace, except the rajas and great officers, who pay a most profound reverence to the emperor, and prostrate themselves when they depart from him.

No pomp, magnificence, or luxury, is comparable to the ostentatious brilliancy of the Great Mogul when he appears in public. He sits upon a throne of gold, glittering with precious stones: the throne and monarch are both upon the back of an elephant; which elevation gives the emperor such an air of grandeur, as must surpass the conception of any European who has not seen him.

As the elephant moves slowly on, the people fall prostrate before their great and mighty prince. Thus, by dazzling the eyes of his slaves, and inspiring them with terror, he supports his despotic authority.

On the shield of this splendid despot are diamonds and rubies; on his head a gaudy turban; and on his neck a rich chain of pearls. Besides a sword, he has a

quiver of arrows; and on the right and left side of him hang rubies or diamonds: he holds a staff in his hand, adorned with drilled diamonds. He has rich bracelets on his wrists, as well as above his elbows; and on his fingers are costly rings.

When the Mogul marches at the head of his troops, he is attended by about an hundred elephants, richly caparisoned, and ten or twelve thousand men. In the centre, either on an elephant, or a fine Persian horse, rides the emperor. When he goes into the country, he is seated in a covered chariot drawn by oxen.

The emperor has under him four principal secretaries of state, namely,

1. The Bagfet, who has the care of the army, and whose duty it is to observe that the governors of the respective provinces duly pay their soldiers, and preserve the proper number of men in each regiment.

2. The Adlet, who superintends the conduct of the emperor's ministers, and inspects the decisions of the judges.

3. The Divan, who divides the land to the respective officers of the provinces, and superintends their conduct over the people.

4. The Casmun, or High Treasurer, who, once a week, lays the accounts of the different provinces before the emperor.

The sons of the emperor are styled sultans, and his daughters sultanas; the nabobs are viceroys or governors of provinces; the next in rank have the title of khan, or cawn: the great officers in the army are styled omrahs; and a chief, or general, is called mirza. The subah of the decan hath the superintendence of all the Mogul governors within his jurisdiction, and whose supreme vice-royalty is made up of several provinces, which were formerly so many independent states. The women in the emperor's seraglio are upwards of a thousand: he allows himself four real wives, and generally marries some of his own subjects: the first son of either wife is heir to the empire, though the crown is usually enjoyed by him whose sword can do most execution. The sultans are married when about 12 or 14 years old, and are afterwards sent to different governments, the heir to the throne excepted, who stays at home. The sultanas, who are restrained from marrying, are educated very liberally; and, in consequence of their restriction from marriage, great indulgences are often given to those princesses. The governesses of these ladies have frequently no inconsiderable share in the government; for great offices are often disposed of through the sole influence of these women, each of whom, indeed, hath a title answerable to some consequential department, and corresponds with the minister whose title she bears. The emperor, in retirement, is attended and served entirely by women.

Sound reason sufficiently intimates to mankind, that upon their multiplication in the world, their honour, peace, and safety, could not subsist without the establishment of civil government; which cannot be understood without a supreme authority. The sovereign authority, whether it resides in a single person, or in a council, as in a proper or particular subject, produces different forms of government. One species or form of government is, when the sovereignty is lodged in a council, consisting of all the members, and every member has the privilege of a vote; which is called a democracy: another is, when the sovereignty resides in a council composed of select members, and is called an aristocracy: a third is, when the sovereignty is lodged in the hands of one man, and is called a monarchy. In a democracy the sovereign is styled a people: in an aristocracy the power is in the optimates, nobles, or senators: but, alas, in the third, the whole centers in one man, who is styled the monarch; and such is the Great Mogul; who considers other princes so greatly inferior to him, that, like the other Asiatics, he has too much pride to send them ambassadors; nor are ambassadors treated as the representatives of their sovereigns, but merely as messengers. The letters of the emperor are received with as great humility and reverence as if he himself was present; for the governor to whom they are sent, on receiving information that they are on the road, sets

sets out with his whole retinue to meet the bearer of them, and no sooner comes within sight of him than he gets off his horse, and prostrates himself on the ground.

In all capital cases the emperor decides himself, as his viceroys do in their different governments. Though there are no written laws, particular punishments are inflicted for particular offences. Murder and robbery are punished with death; but the mode of executing is entirely in the will of the Mogul or his viceroy. Some offenders are beheaded, some hanged, some impaled upon sharp-pointed stakes, and other trampled to death by elephants.

The poor criminal, who is doomed to suffer excessive torture, has the bones of his legs and arms broken by the elephant, who kicks him in those parts with his heavy foot, and then leaves the victim to expire. There have been instances of delinquents being torn into pieces by dogs in the empire of Indostan.

A court of justice is held at certain times, for determining disputes relative to property, and other controversies among the people. It is called the Durbar, and is a large building, open on one side for the admission of spectators. Hither the person injured repairs, and addressing himself to the court, calls out with an audible voice for justice against the offender. As soon as he is observed by the judge, he proceeds to the upper end of the court, and relates his grievances with all the humility he is master of, as the favour of the judge is his only dependence for redress. This degree of flattery, however, will not operate without it is attended with pecuniary compliments; and that party which outwits the other, in this particular, is sure to obtain a conquest over his adversary: so that the grievance of the complainant is often increased by advancing one part of his property in expectation of obtaining the other.

Courts are likewise held for the administration of justice in every town and village, the principal person of which acts as judge, and determines all disputes within his district; the determination, however, is generally formed in favour of him who displays the greatest liberality.

Law-suits are here very quickly adjusted, as the whole power of deciding is solely vested in the judge, whose principle is avarice, and whose soul is a stranger to tender or equitable sentiments.

When the great Mogul himself holds a divan or public court, he is seated on the musnud, which is a kind of stage elevated to the height of about two feet, covered with a superb cloth, embroidered and fringed with gold. In the center of the musnud is placed an oblong plate of silver gilded, turned up at the edges, and resembling a tea-board, upon which the *Conqueror of the World*, for so the Mogul styles himself, sits cross legged like a tailor. His officers surround him, his courtiers adulate him, and the unfortunate petitioner him. As there is something singular in the ceremonial of the latter, it may be entertaining to particularize it.

The petitioner is obliged to leave his slippers on the outside of the door, and to advance barefooted in token of humility; he then makes three salams, or salutes, to express his profound veneration, bows his forehead to the ground, and presents his petition together with a purse of gold, as the one would be useless without the other, for the first only contains a detail of grievances, but the latter is filled with that persuasive eloquence which alone can induce the monarch to redress them. The petitioner on giving the paper or purse usually says, "Read this my petition, the day will come when all petitions shall be read." If the Mogul does not chuse to receive the petition, he frowns and turns away his head; but if the petitioner finds favour in his sight, that is, if the bribe is sufficiently large, and the ministers have been previously well fed, he smiles and gives a gracious nod of approbation. The Mogul does not, however, always redress the grievance when he receives the memorial and its golden attendant, but is frequently so charmed by the rhetoric of the latter, that he puts the object of oppression to the trouble and expence of repeating the former.

Such is the determination of justice in India!

— the balances she holds

Are not to weigh the right of the cause, but
The weight of the bribe: she will put up her
Naked sword, if thou offer her a golden scabbard.

LILLY'S MIDAS.

Two grand and solemn festivals are celebrated every year in honour of the Mogul. The first, which commences with the new year, continues about 20 days. Before the royal palace a splendid theatre is built, which the emperor ascends, and seating himself on a cushion decorated with pearls and gold, receives the presents brought to him from his people. The other festival is held on his birth day, when he dresses himself in his gaudiest apparel, and enters a magnificent pavilion, attended by his courtiers, where are two large scales, the chains of which are of massy gold adorned with jewels. Into one of these scales the emperor places himself, in order to balance or preponderate the other, which is filled with rubies, emeralds, pearls, gold, silver, fine stuffs, cinnamon, cloves, herbs, &c. and an exact account is taken of the difference of his weight from the last year; if he weighs more the present year than the last, the people shout and rejoice; if less, they manifest every expression of concern.

Towards the conclusion of the first-mentioned festival, the emperor distributes his bounties among the grandees and others, consisting of offices and dignities, and which he generally bestows on those who have made him the most considerable presents. The second concludes with the distribution, from the hands of the Mogul, of golden almonds, and other artificial fruits formed of that precious metal; and to the poor he distributes small pieces of money.

With respect to the Indian camps, the soldiers make up the smallest part of them: they are always pitched in one form, and are nearly round. Every trooper is attended by his wife, his children, and two servants; one of the servants to look after his horse, and the other to forage. The train of the generals and officers is proportioned to their ambition and vanity. The sovereign himself, more intent upon making a parade of his magnificence than upon the emergencies of war, when he takes the field, is attended by his seraglio, his elephants, his courtiers, and almost all the inhabitants of his capital. To provide for the wants, or fancies, or luxuries of this mixed concourse, a sort of town is formed in the centre of the army, full of magazines and other articles. In short, here are shops, and all sorts of trades are carried on as in a city. A detachment always marches before the army, and clears the ground: the whole circumference seldom takes up less than 20 miles; for the soldiers alone generally amount to about 100,000. The tents are commonly white, except the Mogul's, which is red, and is higher than the rest: it is encompassed by an enclosure about 10 or 12 feet in height, guarded by the household troops. The tents of the officers encircle the emperor's, and are arranged according to the respective rank each bears in the army. The camp seldom moves 10 miles at a time; nor is there any order observed in marching: every soldier goes on as he pleases, only following the corps to which he belongs: he is often seen carrying his provisions upon his head, with two vessels for dressing them; whilst his arms are carried by his wife, who is commonly followed by several children. The camp fixes, if possible, at a place where there is a plenty of water; and the army hath frequently a number of barges, placed on carriages that follow the camp, and these are used by the Mogul when he takes his pleasure upon lakes or rivers; he also hath with him hawks, dogs, and leopards bred for the game. In these marches some of the emperor's ladies are carried incog, either in some kind of close carriage, or in small towers placed on the backs of elephants, and are attended by proper guards appointed for that purpose.

The troops of the Mogul are principally furnished by the rajahs; he has several regiments called household troops, which are his body guards. There are also the guards of the golden mace, of the silver mace, and the iron mace; these carry maces, and are all chosen men,

who

who have distinguished themselves by their valour. But the most respectable and honourable body among the emperor's forces is a regiment of 4000 men called the emperor's slaves; these are the principal of the household troops or body guards; and their daroga or commander is a person of very great authority.

The arms of the cavalry are a sabre, a dagger, a bow and quiver of arrows, a lance, a kind of carbine, and a shield: those of the infantry are a sword and dagger, a bow and arrows, a shield, and either a pike or musket. They have also, as hath before been observed, small guns which they fire from the backs of elephants. Added to all these, they have an heavy artillery; though it must be confessed they are obliged to have European gunners to manage it.

To provide for the ostentation and pomp of a camp, the whole country is in agitation, and orders are issued for the bringing in provisions from every quarter to supply it: there is always great confusion in its operations; and a famine, with contagious distempers, frequently attend it. There are besides considerable losses sustained in men, beasts, and implements of war, in the crossing difficult roads, and particularly in passing over rivers; for, in the rainy season, the rivers become so rapid, that the landing-place is often a mile below the place of embarkation.

The natives of Indostan engage in war as seldom as possible, notwithstanding they affect a strong passion for military glory. Those who in battle have had the good fortune to obtain some marks of distinction, are executed from serving for some time, and there are few who do not avail themselves of this privilege.

The general ill success of the Indian armies in battle is owing to their being unacquainted with regular discipline; for the action is no better conducted than the preparations for it. The cavalry, in which consists the whole strength of an Indian army, (for the infantry are on so low a footing as to be held in general contempt) are useful enough in engaging with their sabres, but cannot stand the fire of musquetry or cannon: they are afraid of losing their horses, which are mostly Arabian, Persian, or Tartarian, and in which their whole fortune consists; they are so fond of them, that sometimes they will go in mourning for the loss of them.

They are terrified with the artillery of an enemy, at the same time that they have a most high opinion of their own, which they neither know how to transport or any way make use of. Some of their great pieces, to which they give pompous names, will carry balls of 70 pounds, and rather obviate than accelerate the obtaining a victory; for when the Europeans march round them with their light field-pieces, they put them into the greatest confusion.

Every rajah, as well as the sovereign, rides on an elephant; and the eyes of the whole army are fixed upon their prince: if he falls in battle, it is concluded that he is certainly slain, and the troops all disperse: this affords the Europeans an opportunity of subverting the operations of the enemy, and of obtaining a conquest from the most trifling armament.

Notwithstanding they have considerably suffered by being surprised in the night by the enemy, yet they have never established a necessary vigilance in their camp; for at night they eat a prodigious quantity of rice, and take strong opiates which intoxicate them, and plunge them into a dead sleep, when they ought to be on their guard against their more watchful and political enemy.

They think that the opiates warm their blood, and animate them to heroic actions; and in this temporary state of intoxication they, in their impotent fury, as well as dregs, for the whole eastern dregs has in it an effeminacy bear a nearer resemblance to women controlled by enthusiasm, than to men of spirit and military prowess.

SECT. VII.

Of the Trade, foreign and domestic, Manufactures, Revenue, Coins, Weights, Measures, &c.

THE merchants of Indostan carry on a most brisk and flourishing trade to Persia and the Red Sea,

supplying both Persia and Turkey with all the rich merchandize of India; in return for which they import pearls, carpets, and other Persian commodities, but chiefly treasure, to a vast amount.

Revolutions in Asia are so frequent, that trade cannot be carried on in the same continued track as it is in Europe.

The Indians make use of European ships for the importation of their treasure, by way of security from the assaults of pirates. They do not universally observe one and the same method in painting their cottages; either because there are some niceties peculiar to certain provinces, or because different soils produce different drugs for the same uses.

The chief manufactures of Indostan are calicoes, silks, and muslins: we import from thence indigo, salt-petre, opium, pepper, &c. &c. with diamonds and other precious stones. The articles taken from Europe thither are gold and silver lace, English broadcloth, sword-blades, looking-glasses, knives, tin-ware, brandy, beer, &c. &c. All the goods carried to India, however, are trifling in proportion to the bullion and foreign coin taken thither.

The goldsmiths are a very ingenious set of people, and will imitate with great nicety any work performed in Europe.

In some parts the natives forge very good blades of swords and poinards; they, however, have neither clocks nor watches.

The cement used in house-building is made of sea-shells, and is harder than brick-work; they cover the tops of flat-roofed buildings with it, through which no bad weather can penetrate; and with this same cement they frequently lay the floors of their rooms.

The foreign trade of Coromandel is not in the hands of the natives. In the western part indeed there are Mahometans who send vessels to Achen, Merguy, Siam, and the eastern coast: exclusive of ships of considerable burthen employed in these voyages, they have smaller embarkations for the coasting trade for Ceylon, and the pearl fishery. The Indians of Masulipatan turn their attention another way: they import white calicoes from Bengal, which they dye or print, and dispose of them again at the places from whence they had them at a very considerable profit. Excepting these transactions, the trade is entirely vested in the hands of the Europeans, whose only partners are a few Armenians and Banians.

The quantity of calicoes exported from Coromandel to the several sea-ports of India, may be estimated at 3500 bales: of these the English carry 1200 to Bombay, Malabar, Sumatra, and the Philippine isles; the French 800 to Malabar, Mocha, and the isle of France; and the Dutch 1500 to their several settlements. Coromandel supplies Europe with 9500 bales; 3000 of which are brought by the English; 3200 by the Dutch; 2500 by the French; and 800 by the Danes.

The principal employment throughout India is weaving, but the greatest manufactory is at Dacca in Bengal, where the finest calicoes, muslins, and dimities are made. It is to be observed, that those manufactured for the immediate use of the Great Mogul himself, and his zanannahs, are of exquisite workmanship, and of ten times greater value than any that are permitted to be sold either to natives or foreigners.

The filligrane is admirable, the workmanship costing infinitely more than the metal itself; it is not perforated as with us, but cut into threads and joined with such inimitable art, that the nicest eye cannot perceive the junctures.

The embroidery and needlework are infinitely superior to any thing of the kind done in Europe, but it is remarkable, that the embroiderers and sempstresses, if we may be permitted to so call them, are all men, whose patience is as astonishing, as their slowness is singular.

The gold and silver silks, and gauzes, are manufactured at Benaras, but their richness exceeds their elegance; they are executed without taste, and make a very dull appearance when finished, wanting the delightful gloss, and vivid colours, which so greatly enliven,

and give such spirit and beauty to the silks and gauzes of Europe and other places.

The exceeding slowness of the manufacturers renders most of the commodities of India very expensive; none will work but when absolute necessity compels them to it. So that when a merchant has occasion for any article, he is obliged to send for the maker, furnish him with materials to proceed, and advance him the money that his labour will amount to previous to his entering upon the business. The work is then miserably tedious, both from the natural indolence of the workman, and his want of proper tools. For though the Indians feel the inconvenience of the latter, they are too idle to think of inventing such as would be better adapted to the work, or calculated to facilitate the business with more ease and greater expedition. They are yet unacquainted with the use of a loom, and by the union of an inactive disposition, and the most absurd prejudices in favour of old customs, an easy day's business becomes a tedious week's labour.

They copy with exactness, but have neither genius to invent, or ingenuity to improve. Hence their works are admirably neat without being pleasingly elegant; and display the most exquisite fineness, without the least delicacy of taste.

How unlike is the indolence of these warm climates to the unremitting industry pursued in colder regions, where

"The chiefest action for a man of spirit
"Is never to be out of action.—We should think
"The soul was never put into the body,
"Which has so many rare and curious pieces
"Of mathematical motion, to stand still.
"Virtue is ever sowing of her seeds
"In the trenches for the soldier; in the wakeful study
"For the scholar; in the furrows of the sea
"For men of that profession; of all which
"Arise and spring up honor."

At Surat they are very skilful in the ship-building art, though it must be acknowledged, their naval as well as their other architecture, is rather awkward and clumsy. Their vessels are made of a wood called teak, which is as durable and solid as oak, and their masts come from the coast of Malabar; their ropes are produced by the fibres of the cocoa-nut tree, and their sail-cloths from their cotton manufactures; they use the gum of the damar tree for pitch, and their anchors are for the most part European; and indeed the most valuable of their cordage is the produce of Europe. The small vessels that are used along the coast of Malabar, are made of the above wood, the planks being fastened together with cords; they are flat at the bottom, and have not any rudder.

The Mogul's revenue is supposed to have amounted to about forty millions per year, before Nadir Sha committed his depredations in the empire, who deprived it of many of its treasures, and by enfeebling the sovereign's authority, enabled several nabobs to emancipate themselves from his power. The revenues arise from the customs of the sea-ports, the produce of the fields, the devolution of the estates to the crown, the presents from subjects, &c. &c.

We shall now treat of the coins, which are the rupee, the gold moor, the pagoda, the fanam, and pice; the value of the rupee, a silver coin, is two shillings and three-pence; the gold moor is worth about fourteen rupees; the pagoda is valued at nine shillings, and is so called from its being stamped with the figure of a pagoda; the fanam, a silver coin, is worth three-pence; and the pice, which is a copper piece, is valued at about a halfpenny. Foreign coins are also current; but for trifling articles, they sometimes make use of courses or sea-shells, or blackmoor's teeth, three of which are valued at about a halfpenny. Capital sums are reckoned by lecks or hundreds, carons or carols, and arabs; the former is an hundred thousand rupees; a caron is an hundred lecks, and an arab is ten carons. They make a threefold division of interest; one of which is vice, another neither vice nor virtue, and a third virtue: this is

their manner of expression. The interest that is vice, is four per cent. a month; and the interest that is virtue, one.

As to their weights, the common weight at Surat is the seer, about thirteen ounces; but as their weights differ in almost every port, and sometimes even in the same port, we cannot with any degree of accuracy specify them.

The coss, with which they measure their land is about an English mile and an half. In liquid and dry measures, one measure is a pint and a half; eight measures are one mearall, or twelve pints; and 400 mearalls are one garic, or 600 gallons.

SECTION VIII.

Roads, Method of Travelling, &c.

THEIR roads are not laid out as with us; in the open countries they travel over deep sands, which in the fair season are intensely hot about noon. At the end of every tenth or twelfth mile, however, there is a caravanera or choultry, for the convenience of travellers, with a reservoir or tank of water near it; and people, in the neighbouring villas, often order fires to be made for the travellers to dress their provisions. A caravanera is a house consisting in general of two rooms; and the rich people who travel spread their carpets and sleep in one of them, while their servants prepare their provisions in the other.

Persons in opulent circumstances ride in their palanquins on the roads, carried by eight or ten men, who are called cooleys, and who are at proper times relieved by others. As there are no inns upon the road, the traveller takes care to furnish himself with most of such necessaries as he thinks he shall have occasion for. Morning and evening are the usual times of travelling. The cooleys are hired on purpose, and have not more than three-pence per day each, and their provision; though they travel at the rate of four or five miles an hour, and are almost naked.

Besides these cooleys, it is customary to have a guard of mulqueeters, for the security of the traveller from robbers and wild beasts.

Here are no stated posts, but letters are dispatched by express; and the bearers of them, who travel with amazing expedition, are very moderate in their charges.

SECTION IX.

Of the Provinces and Cities of Indostan, &c. particularly Dehli and Agra, with a particular Account of a Battle fought between Men and Beasts, &c.

IN the midland provinces of Indostan, the only places worth mentioning, are the cities of Dehli and Agra. The city of Dehli, or Delli, capital of the province of Dehli, situated in the heart of the empire, is in 28 degrees east longitude from London, and in 26 degrees north latitude: it stands in the form of a crescent on the river Gemma, which divides it; and it is distinguished into three towns, lying within about 120 miles north of Agra, in a fine plentiful country, where the air is more cool and salubrious than at Agra. The first town that was built, is said to have had nine castles and fifty-two gates. At some distance is a stone bridge, and a delightful plantation of trees, leading to the second town, which was taken from the Indians by the first Mogul conqueror. This was adorned and enriched by several magnificent sepulchres of the Patan princes, as well as other stately monuments, which were all demolished by Shah Jehan, father of Aurengzebe; but the latter rebuilt the town, and called it Jehan-Abad, transferring the seat of the empire hither from Agra, where the heat of the summer was too violent. The third town, which was erected close to the second, and formed out of its ruins, was called Dehli by the Indians, instead of Jehan-Abad, the basis of which was said to have been laid in blood, as the throats of mulfacturers were cut, by Jehan's order, "the better, he said, to cement the stones." He spared no expence whatever to adorn and beautify the gardens belonging to the royal palace, which was formed by an ingenious Venetian, after an Italian model.

The

The city of Delhi is entered by a long street, with arches on each side of it, under which are the shops of the tradesmen. This street leads directly to the palace, at the entrance of which are a couple of elephant figures, on whose backs ride two famous rajahs, representatives of two brothers, who lost their lives in bravely defending certain towns laid siege to by Eckbar. The palace wall, which is of hewn stone, with battlements, and every tenth battlement having a tower, is not much less than two miles in circumference. The ditches encompassing the wall are full of water, and are likewise faced with hewn stone.

Into the first court of the palace the great lords and other grandees enter, mounted on their elephants, richly caparioned. This court has an avenue to a passage adorned with brilliant porticos, underneath which are small apartments for the accommodation of the guards. On each side of the passage are apartments for ladies, and the halls of justice. In the centre there is a fine canal, formed elegantly, at proper distances, into lesser basins. This grand passage leads to a second court, where the omrahs are seen mounting guard in person. On entering a third court, the divan is seen in full view, and here the emperor gives audience. This structure, which is open on all sides, and arched at top, is supported by about 30 marble pillars, which are most beautifully painted with flowers. It has a grand hall, ascended to by a flight of marble steps; and in the centre of this hall is a sort of alcove, richly ornamented, in which the emperor is seated on a throne glittering with diamonds.

There are many other public edifices in this city, the most distinguished of which is a spacious mosque, and a very magnificent caravanera. The latter of these was erected by a Mogul prince. It is situated in a large square, and surrounded by arches supporting open galleries, where the Persian, Usbeck, and other foreign merchants lodge, in very commodious apartments, and who have also warehouses for their effects.

The houses of the great, which are on the banks of the river, or in the suburbs, are spacious and airy, having large courts, cellars, gardens, groves, ponds, fountains, and enormous fans on each side for the purpose of cooling the air.

The houses of the poorer sort of people are built with clay, and thatched, but have convenient courts and gardens.

There are besides these a great number of small cottages built of clay and straw, which are chiefly occupied by those who deal in provisions. There are so numerous, and in such clusters, that fires often break out, and great damage is done, as well as many lives lost.

Here is a market for all sorts of green and dry fruits, which are brought from Persia and other countries, but they are in general exceeding dear; melons in particular will fetch from six to eight shillings each.

There are not any mechanics in this city, nor from want of skill in the people, but from the ill-treatment of the omrahs, who, if they can meet with them, oblige them to work and reward them according to their own discretion. The rajahs, and many others of the principal inhabitants, are exceeding wealthy; their most estimable possessions are jewels, which they take particular care shall be faithfully transmitted to their posterity.

The Patans, who live at the foot of Mount Imaus, to which they fled from the power of the Moguls, rendered themselves formidable against Nadir Shah; and after the latter had abandoned Indostan, they themselves invaded the country in its then weak and defenceless state.

The Mogul no sooner heard of the march of the Patans towards his empire, than he called his great officers of the army together, and holding in his hand, agreeably with the eastern custom, a betel, he offered it to that general who should instantly take on him the command of his forces, to oppose the designs of the enemy; but such, alas, was the pusillanimity or perfidy of his officers, that not one of them would accept the offer made by their sovereign; upon which the young prince, who was only then about 18 or 19 years of age, being much

concerned for the distressed situation of his father, solicited that he might be suffered to accept the betel. The emperor, however, refused it him; but the officers or omrahs joined in the entreaty of the prince; as he had so voluntarily made the offer, the emperor consented, and vested him with the command.

The officers, however, piqued at the presumption and boldness of the young prince, entered into a conspiracy to betray and give him up to the enemy; but the prince being happily apprized of their design, laid them all under arrest, threw them into prison, and then vigorously attacking the invaders of his country, repulsed and drove them entirely away.

In the interim, the conspirators getting out from prison, caused a report to be circulated, that the prince was slain in the battle, and with violence entering the palace gates, strangled the emperor, and propagated a fresh rumour, that the sovereign, on account of his son's death, had put an end to his own life. At this fatal crisis it was, that the young victorious prince was returning in all the pomp of war to Delhi, when hearing of the horrible catastrophe which had happened, and apprehending his own life to be in imminent danger, he had recourse to stratagem: he affected to believe, that his father had died a natural death, or had killed himself; and, assuming a fakir's garb, declared he should, from that moment, renounce the world, nor trouble himself in the least about government. The conspirators, hearing of this his resolution, went forth to meet him, and acknowledged him their lawful sovereign; but the prince, however, assured them, he should not succeed to his father's crown, but should retire to some sequestered place for meditation; to which end, he begged their attendance that evening in the palace, in order to consult on the election of an emperor.

The omrahs attended; the guards seized their persons; and the young mogul Amet Shah triumphed over both his foreign and domestic enemies.

Soon after, however, the tranquillity of Delhi was more effectually disturbed; for the Patans, considerably reinforced, again attacked the city, conquered it, plundered it, and seized on the royal treasury. They then marched home with their spoil, which was supposed to amount to more (jewels excepted) than Nadir Shah had before pillaged.

The Patan invader, when he halted at Lahor, drew a line from north to south, claiming a vast track of land to the west of that line, tributary to the empire of Indostan; and leaving his son Timur there as generalissimo and governor of this extent of territory, he no farther at that crisis molested Indostan. But as all the riches of the land were carried off, a general dejection ensued, the grounds lay fallow, and the manufacturers stood still; the people would not work for foreign plunderers, and want and famine were speedily felt. Thus did ambition oppress the fine region of Indostan.

Many revolutions happened afterwards at Delhi, and in the year 1757, Timur was placed on the Imperial throne.

The city of Agra is the capital of the province of that name; it was founded in the year 1566, by Eckbar, who called it Eckbarabat, and made it the metropolis of his empire. It is situated in 26 degrees north latitude, and in 79 degrees east longitude from London: it lies on the river Gemma, about 700 miles north east of Surat, a journey which the caravans generally perform in nine weeks, and about 500 leagues north of Pondicherry on the Coromandel coast. It stands in the middle of a sandy plain, which greatly adds to the heat of the climate; it is about eight miles long, but not near so broad; and no part is fortified but the palace; there are, however, generally, a great number of soldiers here. The houses are so situated, as to command an agreeable prospect of the river, and, according to Tavernier, are at some distance from each other encompassed by lofty walls. The buildings of the omrahs and other great men, are of stone, and elegantly constructed. The great numbers of mosques, caravanferas, squares, baths, and reservoirs, intermixed with gardens, trees, and flowers, renders this place extremely pleasant; and the royal palace is a magnificent structure, situated in the

form

form of a crescent on the banks of the river, defended by a lofty stone wall mounted with cannon, and encompassed by a broad moat, across which are draw-bridges; and there is a terrace garden cut through, with canals of running water, mixed with verdant plats and summer-houses, forming a most pleasing scene. The palace is divided from the city by a large noble square, where the rajahs alternately mount guard at the two outer gates, facing the principal streets of the city. On entering the first gate of the palace, a fine stone walk presents itself, with canals on each side of it; and further on is seen a spacious square, in which the omrahs assemble, and the Mahometan guards are mustered. Still further on, the eye is presented with another grand square or court, which leads to the Durbar, (another spacious court) originally the place of resort for persons who had audience of the emperor; during which interval a band of music always played, while the imperial monarch sat on a throne of jewels.

Around the palace are elegant gardens, with fine canals; there are also extensive parks; so that the circumference of the whole is very considerable.

This venerable city had, in 1638, no less than seventy mosques; and pilgrimages are at this time made to a famous mosque, in which there is the sepulchre of a saint 30 feet long and near 16 broad.

When a man has committed any particular crime, and is pursued in order to be punished for his offence, he flies directly to a mosque, and there finds a certain shelter: not even the emperor himself can hurt him after he has once flown to its sacred walls; for the attempt to punish, in this case, would be a direct violation of that profound respect and reverence due to such as have the title of saints.

There are 800 purifying baths in this city; and near it stands that grand piece of architecture, the mausoleum, which 20,000 men were 22 years in building.

The greatest part of the inhabitants of Agra are mahometans and moguls; and the city flourishes when honoured with a visit from the great mogul; but in general it has little to boast of with regard to commerce.

Among other entertainments given by the great mogul to foreign ambassadors, is one of a very singular nature; it consists of wild beasts of various sorts fighting with each other, or combated by men, who engage in such dangerous enterprises to obtain the favour of the king. The manner of one of these fights, which was exhibited at Agra, (when the moguls kept their court there) is thus described: first, two buffaloes were let loose at each other, and afterwards a lion and a tiger, the two latter of which fought desperately for some time. These being taken away, the governor arose and said: "The Great Mogul's will and pleasure is, that if any valiant heroes are minded to give proofs of their valour, in fighting against the wild beasts with shield and sword, let them come forth; if they conquer the Great Mogul will shew high favour to them." On this three persons entered the list, and engaged to undertake the combat; when the governor calling out said, "None must fight with any other weapon than sword and shield; those which have a dagger about them must throw it away, and fight fairly." A lion was then driven into the ring, where one of the three stood ready to encounter him: the lion immediately ran to him with the greatest ferocity, but the man defended himself a considerable time, till his arms growing weary, the lion laid one of his paws on the shield, and the other on his arm; the man finding himself unable to use his sword, and seeing the danger he was in, with his left hand drew out his Indian filetto, and gave the lion so violent a stab in the throat, that he immediately let go his hold; after which he severed his body almost in two with his sword, and pursuing his victory, effectually killed him, when the people shouted out, "Thanks be to God, he is conquered." The Mogul, however, smiling, said to the conqueror, "You are a brave soldier, you have fought valiantly; but did not I command you to fight fairly, with sword and shield only? but like a thief you have stolen the lion's life with a filetto." After this the king ordered the man's belly to be immediately ripped open, and that his body should be carried on the backs of ele-

phants throughout the city; which sentence was immediately executed.

A tyger was then brought to the ring, which was encountered by a very strong man; but the tyger was too active, that he suddenly leaped on his antagonist, and tore him to pieces.

A very small person then engaged the tyger, and at the first encounter cut off both his fore feet, which obliged him to fall; he then pursued his efforts, and soon killed him. On this the king calling to him, asked his name; to which he answered, Geiby: the king then ordered one of his servants to carry him a cloth of gold, who, when he delivered it to him, said, "Geiby, receive this coat, which the Mogul of his bounty hath sent." The conqueror received the coat with great humility, kissed it seven times, and afterwards holding it up, prayed to himself for the Mogul's prosperity; which done, he cried aloud, "God grant the Mogul to grow as great as Tamerlane, from whom he is derived; may he live 700 hundred years, and his generation continue for ever." After he had thus expressed himself, he was conducted by an eunuch to the king, who, on his going away, said, "Be praised, Geiby Chan, for your heroic exploits; this name you shall keep for ever; I am your favourable lord, and you my vassal."

On the north of Indostan is a very formidable nation called the Scheiks, who can bring into the field 60,000 cavalry. They possess the whole province of Panjal, the greatest part of the Moultan, and the Sindi, and all the country towards Dehli, from Lahor to Serhend. These people have found means to free themselves from the chains of despotism, though encompassed by nations of slaves. During the calamities of the Mogul empire, their number increased considerably by refugees from different nations. It is affirmed, that they have a temple with an altar, on which stands their code of laws, and next to it a sceptre and a dagger. To be admitted amongst them, nothing more is required than to swear an utter abhorrence of monarchy.

Cashmere, or Cassimere, which is about 76 miles in length, and 30 broad, is one of the most pleasant countries in all India; it is divided from Tartary by Mount Caucasus, and is situated on the northern part of the empire. It is surrounded by mountains, and is one continued beautiful garden, yielding every luxury as well as necessary of life. The natives, who are Mahometans, are industrious, lively, sensible, and ingenious; they are of European complexion; and the women, who are distinguished for their personal accomplishments, are on that account purchased by the omrahs.

To the north of Cashmere is the province of Lahor, situated in 32 degrees north latitude, which was subdued by the Patans. In this province are mosques, caravanseras, baths, pagodas, palaces, and gardens. There is particularly here antique edifices, once the residence of the moguls, and on which are inscribed the exploits of many of those monarchs.

The chief places on the west of India are now to be the objects of our attention. The province of Sindy, situated on the river Sind, is a very fruitful country. Here is a great plenty of cattle of all sorts, and numbers of tame and wild fowl. The province abounds in wheat, rice, and pulse; nor have they ever a dearth, the Indus overflowing all the low grounds in April, May, and June, and leaving a fat slime that enriches the earth.

This country produces salt-petre, sal-armoniac, borax, lapis-lazuli, lapis-turci, asa-fetida, lignum-dulce, bezoar, opoponax, and raw silk.

The natives manufacture both silk and cotton, as well as chintz, and very handsome counterpanes. They make also fine cabinets, lacquered and inlaid, with ivory. They export a great deal of butter, which is put in duppas or jars, containing from five to 200 pounds weight. The quota of forces furnished from hence to the Mogul, is 4000 horse, and 8000 foot.

The established religion of the people is Mahometanism; there are, however, ten Gentooes to one Mahometan.

The natives here have a particular festival, called the Feast of Woolly, when both sexes meet, and dance to the

the four distribut other.

the sound of pipe, drums, and cymbals. The women distribute sweet-meats, and the men squirt oil at each other.

Tatta, the capital of the province, is situated in a large plain; it is about three miles in length, and about one and a half in breadth. Here is a palace for the nabob, and also a citadel. The citizens are celebrated for making very handsome palanquins.

At a small distance from the above city, are several very large and magnificent tombs, which contain the remains of some of the ancient monarchs of Sindy. The largest, which is in the form of a cupola, is about 30 feet in height, and 21 diameter. It consists of the most beautiful variegated porphyry, polished in the most exquisite manner.

The citadel in Tatta, mentioned above, and which stands at the west end of the town, has barracks and stables, capable of accommodating between 20 and 30,000 men and horse.

To the south of Sindy is the province of Guzurat, or Cambaya, which is rendered a peninsula by Cambaya bay on the south-east, and Sindy bay on the north-west. From north to south it extends about 300 miles, and from east to west about 400 miles.

The chief city of Cambaya is Amadabad, about 140 miles to the northward of Surat; it is the most noted inland town of the Mogul empire, and is situated in 23 degrees north latitude, and 72 east longitude, from London. It stands in a most delightful plain, watered by the river Sabremetty. It is surrounded by a wall of brick and stone, flanked with round towers, 40 feet high, and has 12 gates. The town, including its suburbs, is about four miles in length, and the streets are spacious: the Meidan-hah, or King's-square, in which the courts of judicature are held, is 400 paces broad, surrounded with noble arches, and adorned with palm, date, orange, and citron trees; on one side is the king's palace; on the south stands a caravanfara for the accommodation of strangers; and there are several other public edifices. The English and Dutch have factories in this city; and here are several mosques belonging to the Mahometans, particularly one called Inna Meigid, which is very large, and has grand domes, arches, and spires; the whole supported by 40 noble pillars.

The town is so intermixed with gardens and groves, that at a distance it has a most pleasing and rural aspect. It has upwards of 20 towns under its jurisdiction, and near 300 villages. One of the villages, called Serqueeh, is distinguished for the tombs and monuments of the ancient kings of Cambaya, or Guzurat.

The city, Cambaya, is situated in 23 degrees north latitude, at the bottom of a gulph of the same name. It is about two leagues in circumference, and has very extensive suburbs, exclusive of fine gardens; the streets are spacious, and the houses well built with brick. The English and Dutch have factories here, though great part of the trade is removed to Surat; on which account the city is but thinly inhabited. It is surrounded by a brick wall, and has several sepulchres, besides a stately castle for the nabob.

The Banian inhabitants here shew a particular indulgence to monkeys, which swarm, and are very mischievous. Originally there was an hospital for animals in this place, and the ruins of it are still to be seen. In the country are prodigious numbers of peacocks, which the natives catch after the bird has retired to rest: the flesh of the young ones is white, and the taste of it somewhat like that of a turkey.

The tide in the bay of Cambaya runs with such amazing rapidity, that it is said to exceed the pace of the swiftest animal.

The great commercial city of Surat is situated in the province of Guzurat, on the river Tapta, a short distance from the ocean. The streets of this city are irregularly laid out, though wide at bottom; the shops have rather a mean appearance, the chief traders keeping their commodities in warehouses: here are, however, a great number of very good buildings.

Surat was begun to be built about the middle of the last century, and in a few years became a very con-

siderable place: it is said to contain about 200,000 inhabitants.

Prior to the English East-India company becoming possessed of Bombay, the president and council managed their affairs at Surat; where a factory, which had been established there, was still continued, after the presidency was removed to Bombay. This factory had received from the Mogul government many very valuable immunities; and Persians, Moguls, Indians, Arabs, Armenians, Jews, and Europeans all resorted to Surat, where money was easily obtained, and bills of exchange were to be had for every market in India. Bags of money, tickered and sealed, would circulate for years, without being weighed or counted; such was the honesty of the traders. Fortunes were proportionable to the ease and readiness with which they were to be obtained by commerce: a fortune of 200,000l. was common. Many of the Gentoo inhabitants of Surat enjoy places under the Moorish government, such as collectors, surveyors of the customs, &c.

The chief inhabitants, in hot weather, retire into the country; and the English East-India company have a very pleasant garden, kept in the most regular order.

There is great plenty of all kinds of provisions at this place: the soil of the country is extremely fertile, and produces the finest wheat in India. Here are great numbers of antelopes, and some deer, with plenty of wild fowl.

The Moors, who have the government entirely in their hands, tolerate all religions: when they take an European into their service, they never make any enquiry about his religion, or wish him to become a proselyte.

Surat was plundered in the year 1664 by rajah Sevagi, who carried off not less than 1,200,000l. The plunder would have been much more considerable, had not the English and Dutch avoided the depredation, by having placed their richest commodities in the castle, which was out of the rajah's reach; they had, besides, well fortified their factories; so that the plunderer thought it prudent to retire, without attempting to attack them.

The above grand loss suggested to the inhabitants the necessity of erecting walls; they accordingly built walls round the city; not, however, that this precaution was attended with the advantages expected; for the English, in 1686, stopped all the ships that were fitting out at Surat for the several seas; and this oppression continuing a considerable time, Surat was deprived of almost every branch of commerce that was not its own immediate property. Notwithstanding this and other misfortunes, however, Surat is at this time a flourishing city. Of the produce of the manufactures of Guzurat, which are deposited in warehouses, a considerable part is carried into the inland countries, and the rest to all parts of the globe. The commodities most commonly known are, blue linens, white linens, blue and white checks, printed calicoes, silk and cotton stuffs, gawzes, shawls, and dutties. Surat receives, in exchange for her exports, great quantities of spices from the Dutch; iron, lead, cloth, cochineal, and hard wares from the English; silk from Bengal and Persia; masts and pepper from Malabar; slaves and perfumes from Arabia; teas, sugars, camphire, quicksilver, and toys from China; and from Persia, gums, dried fruits, pearls, and copper. The manufacturers here have generally their work bespoke by the wholesale merchants; and this being the only seaport of any importance in the Mogul's dominions that the Europeans do not possess, the inland trade employs great numbers of caravans for the distribution of the articles imported; and a continual intercourse is preserved from hence with Bombay, by both sea and land. The governor of Surat, who, in the administration of public justice, attends personally in the Darbar, presides with great state, and decides on all actions of a civil and criminal nature.

Blinagar, the capital of the kingdom of the same name, and which is about 200 miles to the east of Carwar, stands on the summit of a high mountain, and is surrounded by no less than three walls.

No Europeans have the privilege of establishing trade in this place, the prince only allowing them to be here in the capacity of travellers or visitors. The prince has a very stately palace; and the chief articles of trade at Bijnagar are damasks, fattins, chints, rich velvets, &c.

SECT. X.

Of the English Possessions and Settlements in the East Indies, with a particular Account of the Cruelties exercised on the English in the Black Hole at Calcutta.

THE province of Bengal gives name to the most considerable gulph in Asia, and divides the two peninsulas of the Indies; it is bounded by Afem and Arracan on the east; by several provinces belonging to the Great Mogul on the west; by hideous rocks on the north, and by the sea on the south. It is upwards of 240 leagues from east to west, and is deemed the most fertile country in India for a variety of valuable articles, such as sugar, silk, gum-lack, salt-petre, rice, opium, pepper, fruits, &c. the greatest part of the Bengal silk is produced in the territory of Cassimbuzar, where the silk-worms are reared and fed in the same manner as in other places; but the natural heat of the climate hatches and brings them to perfection at all times of the year. Considerable quantities of silk and cotton stuffs are manufactured here, and circulated through part of Asia.

Bengal is famous for its fine canes, and a small fort worked into vessels, which being glazed within-side, will hold any liquid. There is likewise an herb here, from which very beautiful stuffs and tapestry are made.

The English company's forces established in Bengal are very considerable. The power is invested in Europeans, though the bulk of the army consists of natives. The whole is thus divided:

Three brigades,	viz.	1	Contains,	One battalion of European infantry,	Each battalion contains ten companies, and each regiment ten battalions.
		2		One regiment of seapoys.	
		3		One battalion of European infantry,	
				One regiment of seapoys.	

Each regiment of seapoys, or black infantry, is commanded by a jemantadar, or native officer, who is, however, subordinate to the English officers of a much lower rank.

The artillery forms one regiment of four companies of Europeans; but the principal drudgery is done by black seapoys: every company of artillery is strengthened by four companies of lascars, containing 50 men in each company, who serve as matrosses; and the brigades have a troop of black cavalry appertaining to each, under the command of English officers.

One of the latest and most elegant writers that we have seen, who describes these regions, gives us the following account of a review of the company's troops, in the presence of the Great Mogul:

"Upon a late great holiday amongst the Mahometans, by desire of the Great Mogul, the English troops were out to be reviewed by him; but it appeared very extraordinary to us, that he did not take the least notice of any thing, or even look on the troops, while they were going through their evolutions; if he did it was with an eye askaunt much practised by the Mussulmen; it seems it is inconsistent with dignity to appear to observe.

"However mortified the soldiers might be at this seeming neglect, we were still pleased with such an opportunity of viewing a shadow of eastern magnificence; for, although the parade exceeded any thing I had ever seen, it was but a miniature of former grandeur.

"All the trappings of dignity were displayed upon

this occasion; the Mogul himself was on an elephant richly covered with embroidered velvet, the howdah magnificently lackered and gilded; his sons were likewise on elephants. The plain was almost covered with his attendants, the officers of his court, their servants, and their servants servants, seapoys, peaders, &c. &c. did not amount to less than 1500 people. All, except the seapoys, were according to custom dressed in white jammers, and turbans; the principal people were on horseback, and well mounted. The train was increased by a great number of state elephants, state palanquins, and led horses richly caparisoned.

"The gilding of the howdahs, and palanquins, the gold stuffs of the bedding and cushions, the silver and gold ornaments, the tassels, and fringe of various colours, some of them even mixed with small pearls; the rich umbrellas, trappings of the horses, and all together, glittered in the sun, and made a most brilliant appearance."

Patna, which is situated in the Upper Ganges, is thought the most famous place in the universe, for the cultivation of opium; but it is far inferior in its strength to that made in Syria and Persia. The fields of Patna are spontaneously covered with the flowers which produce it; and, exclusive of what is carried into the inland country, prodigious quantities are exported to foreign parts. The Indians in general are exceeding fond of it, though its use has been prohibited by the most severe penal laws. In the neighbouring islands, however, it is still consumed in great quantities: they not only chew it, but intermix it with their tobacco, when they smoke, which frequently intoxicates them even to a degree of insanity, and prompts them to commit outrages of the most prejudicial tendency.

Patna is the capital of the territory of the same name, and one of the largest cities in India. The English and Dutch have factories here.

Dacca, the most extensive city in the kingdom of Bengal, produces the best and finest embroideries in gold, silver, or silk. The town is situated in 24 deg. north latitude; the soil is fertile, the situation fine, and to its market are brought the richest commodities of India and Europe. It receives considerable advantages from its cottons, from which are produced striped and worked muslins, more valuable in their texture than those made in any other part of India.

The factory of Fort-william, at Calcutta, belongs to the English East-India company, and is situated on the Hugley, the most westerly part of the Ganges. Here are very convenient store-houses, magazines, and an hospital: here is also a garrison of soldiers; and all kinds of provisions are very cheap at this place; though the air of Calcutta is unhealthy, the water brackish, the anchorage unsafe, and the neighbouring country affords but few manufactures: notwithstanding which, great numbers of the most wealthy merchants, invited by the prospect of security and liberty, here fixed their residence. In 1757, the subah of Bengal, whose indignation had been raised by some procedures of the company, invested Calcutta, which was then in a defenceless state. The governor, alarmed at the appearance of a very numerous army, abandoned the fort, and with many of the chief inhabitants repaired on board a vessel in the river. Mr. Holwell, however, who was second in command, assisted by a few intrepid officers, and a weak garrison, defended the place for some time, but was at length obliged to surrender; and the inhabitants, with the whole garrison, were all forced into a dungeon called the Black Hole, from which only 23 out of 146 persons came out alive; the rest were suffocated with extreme heat.

A man of the least humane feelings will easily imagine to himself the most wretched situation of such a number of his fellow creatures crammed together in a cube of 18 feet, in a close sultry night, with scarce the faintest circulation of air. They had been but a few minutes confined when every miserable captive fell into fo violent perspiration, as brought on a most raging thirst. They all stripped off their cloaths except Mr. Holwell and three other gentlemen; and a proposition was then made, that every man should lie down on his hams: this expedient

Mr. Holwell and
son was then made,
his hams: this ex-
pedient

pedient was accordingly practised several times, and at each time many of the unhappy wretches, more weak than others, and who could not recover their legs when the word was given to rise, fell all along, and were instantly suffocated or trod to death. Repeated efforts had been made to force the door, but to no purpose. Before nine o'clock every man's perspiration and thirst were so excessive, that "water! water!" was the general cry; and an old jemantadar, among the guards, being moved with compassion at their extreme sufferings, ordered some skins of water to be brought.

The tumult, madness, transport! the fury and avidity, the confusion and violence, the lunacy and ravings of the miserable captives on the appearance of water, we cannot possibly convey to our readers a better idea of than by quoting the words of Mr. Holwell.

"The water appeared!" says Mr. Holwell, "Words cannot paint to you the universal agitation and raving the sight of it threw us into. We had no means of conveying it into the prison but by hats forced through the bars: and thus myself, who stood close to the bars, and Mess. Coles and Scott, supplied our fellow sufferers as fast as possible. But those who have experienced intense thirst, or are acquainted with the cause and nature of this appetite, will be sufficiently sensible it could receive no more than a momentary alleviation; the cause still subsisted. Though we brought full hats within the bars, there ensued such violent struggles and frequent contests to get at them, that before they reached the lips of any one, there would be scarcely a tea-cup full left in them. These supplies, like sprinkling water on fire, only served to feed and raise the flame.

"O, my dear friend! how shall I give you conception of what I felt at the cries and ravings of those in the remotest parts of the prison, who could not entertain a probable hope of obtaining a drop, yet could not divest themselves of expectation, however unavailing! and calling on me by the tender considerations of friendship and affection, and who knew they were really dear to me! Think, if possible, what my heart must have suffered at seeing and hearing their distress, without having it in my power to relieve them: for the confusion now became general and horrid. Many forced their passage from the further part of the prison, and pressing down those who were too weak to withstand them, trampled them to death."

Mr. Holwell, from nine to near eleven, thus stood at the bars of the window, supplying the poor creatures with water, and was almost pressed to death; his two companions, and Mr. Parker, who had forced himself into the window, were really so; as were Mess. Bailie, Jenks, Revelly, Law, Buchanan, Simpson, and several others, who lay dead at his feet.

Mr. Holwell now calling out to his fellow prisoners, and begging, as the last instance of their regard, they would remove the violent pressure on him, and suffer him to leave the window, they gave way, and he with great difficulty got into the middle of the prison, where the throng was less by the many that were dead, and by others who flocked to the windows; for by this time they had water also at another window.

In the prison there was a plat-form, raised between three and four feet from the floor, and open underneath. Upon this plat-form Mr. Holwell lay down among many dead bodies, hoping here speedily to breathe his last; but alas! he had not lain many minutes before he was seized with a most violent pain in his breast, and palpitation of heart, attended with a difficulty of breathing and an increasing excessive thirst. Unable to bear these united pains, he made a vigorous effort to get to a window opposite to him, and gaining the third rank at it, with one hand seized the bars, and by that means gained a second. In a few moments the air from the window relieved the pain in his breast, as well as the palpitation, and difficulty of breathing; but his thirst was as great as ever. He got some water; but this increasing instead of abating his thirst, he contented himself with sucking into his mouth the perspiration from his shirt-sleeves, and catching large drops as they fell from his face.

"Whilst I was at the window," says Mr. Holwell,

I was observed by one of my miserable companions on the right of me, in the expedient of allaying my thirst by sucking my shirt-sleeves; upon which, he took the freedom to rob me from time to time of a considerable part of my store; though, after I detected him, I began upon that sleeve he was making free with, and our mouths and noses often met in the contest. This plunderer I found afterwards was a worthy young gentleman in the service, Mr. Luffington, one of the few who escaped from death, and since paid me the compliment of assuring me, he believed he owed his life to the many comfortable sucks he had from my sleeves."

About half after eleven the majority of the surviving prisoners were in an outrageous delirium: every possible abuse of the subah, and every insult against the guard that could be thought of in order to provoke them to fire into the prison, were repeatedly practised to no kind of effect. Indeed even before nine o'clock many insults were offered to the guard to provoke them to fire.

"I need not, my dear friend," says Mr. Holwell, "ask your commiseration, when I tell you, that in this plight, from half an hour after eleven till near two in the morning, I sustained the weight of a heavy man, with his knees on my back, and the pressure of his whole body on my head; a Dutch serjeant, who had taken his seat on my left shoulder, and a black Christian soldier beating on my right; all which nothing could have enabled me to support but the props and pressure equally sustaining me all around. The two latter I frequently dislodged, by shifting my hold on the bars, and driving my knuckles into their ribs; but my friend above stuck fast, and, as he held by two bars, was immovable.

"The repeated trials and efforts I made to dislodge this insufferable incumbrance on me, at last quite exhausted me; and, towards two o'clock, finding I must quit the window, or sink where I was, I resolved on the former, having but one, truly for the sake of others, infinitely more for life, than the best of it was worth.

"In the rank close behind me was an officer of one of the ships, whose name was Carey, and who behaved with much bravery during the siege, (his wife, a fine woman, country born, would not quit him, but accompanied him into the prison, and was one who survived.) This poor wretch had been long raving for water and air; I told him I was determined to give up life, and recommended his gaining my station. On my quitting, he made an attempt to get my place, but was prevented.

"Poor Carey expressed his thankfulness, and said he would give up life too; but it was with the utmost labour we forced our way from the window (several in the inner ranks appearing dead, standing, unable to fall by the throng and pressure around.) He laid himself down to die; and his death, I believe, was very sudden, for he was a short, full, sanguine man: his strength was great; and I imagine that had he not retired with me, I should never have been able to force my way. I was at this time sensible of no pain, and little uneasiness: I found a stupor coming on apace, and laid myself down by that gallant old man, the Rev. Mr. Jervas Bellamy, who lay dead with his son the lieutenant, hand in hand. When I had lain here some time, I still had reflection enough to suffer some uneasiness in the thought, that I should be trampled upon when dead, as I myself had been obliged to trample upon others. With some difficulty I raised myself and gained the plat-form a second time, where I presently lost all sensation: the last trace of sensibility that I have been able to recollect after my laying down, was, my fast being uneasy about my waist, which I untied and threw from me. Of what passed in this interval to the time of my resurrection from this hole of horror, I can give you no account.

"When the day broke, and no intreaties whatever could prevail to get the prison door opened, it occurred to a gentleman, (I think Mr. Secretary Cooke) to make a search for me, in hopes I might have influence enough to gain a release from this scene of misery. Accordingly Messrs. Luffington and Walcot undertook the search,

search, and by my shirt discovered me on the platform, from whence they took me, and, imagining I had some signs of life, brought me towards the window I had first possession of. But as life was equally dear to every man, and the stench from the dead bodies was intolerable, no one would give up his station in or near the window; so they were obliged to carry me back again. Soon afterwards Capt. Mills, who was in possession of a feat in the window, had the humanity to resign it. I was again brought by the same gentlemen, and placed in the window.

"At this juncture the subah, who had received an account of the havoc which death had made amongst us, sent one of his jemmantadars to enquire whether the Chief survived. They shewed me to him, telling him I had appearance of life still remaining, and that it was possible I might recover, if the door was soon opened. This answer being returned to the subah, an order came immediately for our release, it being then near six in the morning."

Mr. Holwell then proceeded to relate, that from the number of dead bodies that were piled up against the door, which opened inwards, there was no possibility of opening it till the dead were removed; and that this work took up 20 minutes.

About a quarter after six o'clock, the remains of 146 souls, being only 23, came alive from the dungeon; among whom was Mrs. Carey. The dead bodies were dragged out of the prison by the soldiers, and thrown into a ditch.

The survivors were all set at liberty, except Mr. Holwell, Mr. Court, Mr. Walcot, Mr. Burdet, and Mrs. Carey; the former were ordered into the custody of an officer; and the latter was detained, on account of her personal beauty, to be the further victim of a fresh tyranny, the lust of some great officer.

Mr. Holwell was in a high fever when he came out of the prison, and was in this condition taken before the subah; as he was unable to stand, they carried him to the tyrant, who said to him, "I hear there is treasure to a very considerable amount secreted in the fort; if you do not discover where it is, you must expect no mercy." Mr. Holwell assured him that he did not know of any treasure; and the subah finding no intelligence could be got, ordered Mhir Muddon, the general of his household troops, to take Mr. Holwell into his custody.

It was the voluntary opposition made by Mr. Holwell, after the governor, Drake, had quitted the fort, that so particularly enraged the subah; and this led him to believe, that there must certainly be some considerable treasure hidden; for Mr. Holwell, it was imagined, would not have undertaken a work of such danger, had he not been actuated to it by very interested principles.

Mr. Holwell, unfortunately, during the hurry and confusion of the siege, after the fort had been abandoned by Drake, forgot to emancipate Omychund, a considerable black merchant, whom Drake had injuriously imprisoned; which unhappy omission Omychund resented as an act of wilful injustice; and had it not been for this man's insinuations, Mr. Holwell might probably have been discharged, notwithstanding he had so highly displeased the subah in his spirited defence of the fort: at least, this was the opinion of Mr. Holwell, and which was strengthened by the confinement of Messrs. Court, Walcot, and Burdet, who were persons against whom Omychund was known to have a particular aversion.

Mr. Holwell and his companions were conveyed in a hackry to the camp, and there loaded with fetters: they were lodged in the tent of a Moorish soldier, which was so small, that they were under a necessity of lying, ill as they were, half in, and half out of the tent, during a most disagreeable and rainy night. The following day, however, their fever fortunately coming to a crisis, boils broke out on their bodies, and the day ensuing they were removed to the coast, from whence they were soon sent by sea to Muxadabad, to be disposed of as the subah should think proper, who was expected to return to that capital from Calcutta.

On their arrival at Muxadabad, after a voyage of

thirteen days, their boils had become running sores, and the irons on their legs had consumed the flesh nearly to the bone. Mr. Holwell now sent a letter to Mr. Law, chief of the French factory, with an account of their miserable situation, and Mr. Law was so humane as to send them every necessary they were in need of.

It was on the seventh of July, in the afternoon, when they landed, and after walking some considerable way as a public spectacle, were placed upon a shed, not far from the viceroy's palace, where they were relieved with great humanity by the French and Dutch chiefs, as well as by the Arabian merchants.

On the 18th of July the subah arrived, and on the 25th the poor prisoners were led to his palace to know their future fate; but it happened that no audience could be given them on that day; and in the evening the subah's grandmother interceded for their restoration to freedom, at a feast celebrated in honour of the viceroy's return home.

The next morning, very early, the unhappy sufferers waiting the subah's passing to his palace of Mootserjel, and paying him, as soon as he came near them, the usual homage, he cast his eyes on them with an appearance of some compassion, and ordered their irons to be knocked off; he at the same time ordered two of his officers to conduct them wherever they should be inclined to go, and charged them to prevent any insult being offered to their persons.

This gleam of mercy, late as it dawned, had the more merit in it, as some wretched sycophants had exercised their utmost endeavours to prevent it, by assuring the viceroy that Mr. Holwell was possessed of a sufficiency, notwithstanding his losses, to purchase his freedom. "He has suffered enough," replied the subah: if he be possessed of any thing, let him keep it."

As soon as the above unfortunate gentleman and his friends obtained their discharge, they took boat, and arrived at Coremadad, a Dutch settlement; whence they embarked, and sailed for England.

After the above melancholy affair of the Black Hole, Messrs. Waton and Clive made their appearance before Calcutta, and entirely reduced the place. The subah, now more enraged than ever, led his army towards Calcutta, and encamped within about a mile of the town, when Colonel Clive attacked him so vigorously, that the viceroy was forced to retreat, after having sustained a considerable loss in killed, wounded, and prisoners.

The town of Calcutta is situated on the banks of the river Hugly, which is an arm of the Ganges. It is tolerably large, but appears very uncouth to the eye from the strange irregularity of its buildings. Every person who erects a house, pleases his own fancy with respect to the manner of the edifice, without paying any attention to the uniformity of the town; so that large and small, elegant and mean, are blended together.

The principal street in this town is called the Buzar, and is inhabited by persons who keep little shops for the sale of various commodities. This place is seldom visited by the English; for they send their servants to buy whatever is wanted, and rely on their fidelity in the purchase.

On the side of the river Hugly, near the center of the town, is the old fort, in which is the place of confinement called the Black Hole, where, as beforementioned, the unhappy English suffered the most wretched punishment by order of the nabob Serajah Dowlah. Some of the apartments in it are used occasionally for the performance of divine service.

About a mile from the town, by the side of the river, is the new fort, which is a very handsome and strong building. It is surrounded with walls, and is exceeding spacious, containing magazines for stores, barracks for soldiers, and elegant apartments for the respective officers; besides which, there are houses in it for the accommodation of the engineers and other officers who reside at Calcutta.

One part of the town is set apart for the residence of the Portuguese and Armenians, each of whom exercise their own mode of worship. There is a church belonging to each; but the Portuguese are restrained from exhibiting

The Armenian women are not employed in any kind of business; but the men collect goods in different parts of India for the merchants. Some of these are permitted to trade for themselves, and obtain very considerable profits. The dresses of the women much resemble that of the Mahometans, except the head, which is covered with a turban of a preposterous size. They have likewise a singular addition to their head-dress after marriage; it is called a mouth-piece, and consists of a piece of muslin, which covers the face from the chin to the under part of the nostrils, and is placed so close to the face, as greatly to impede their breathing.

There are several beautiful villages about Calcutta, which contain many elegant buildings, the country residences of English gentlemen, who retire here, particularly in the hot season, to enjoy the benefit of the air, which is cooler and much more wholesome than in the town.

The intense heat of the climate here subjects the inhabitants to many diseases; but the most fatal is that called the Pucker Fever, which carries off the person seized with it in a very short space of time. It is said, that less women die here, in proportion, than men, which is attributed to the abstemiousness of the former, and the intemperance of the latter.

Madras, or Fort St. George, or Madraspatan, (signifying, in the Indian language, the town of Madras) is the capital of the dominions of the English in India, and is in 80 degrees east longitude, and 13 north latitude. It is near 4800 miles east of London; and the sun rises and sets sooner at Madras by six hours than with us. Its situation is by no means convenient; for the ocean beats with prodigious violence against the shore, and it is subject to inundations from a salt-water river behind it; nor is there a drop of fresh water to be got within a mile of it. It has a fort and garrison, and in the middle of the fort is the governor's house, an handsome stone building.

There are several handsome streets in the town, with good houses. The Europeans inhabit what they call the White Town, which forms an oblong square of about a mile long, surrounded by walls.

The English church here is a very pretty structure, with an handsome altar, a carved gallery, and an organ. It is the custom here to play the organ the moment the governor enters the church, which is floored with black marble, and upon the whole makes an elegant appearance.

Here is also a free-school, where children are educated in reading and writing; besides which there is a library, as well as a church for the Portuguese. These are the only public buildings in the White Town, except the town-house, resorted to by the mayor and his brethren, and in which courts of judicature are held.

To the north of the White Town is the Black Town, occupied by Armenians, Indians, Portuguese, and others; it is near two miles in circumference, and is encompassed by a very thick brick wall, fortified in the modern manner. The streets are wide, but the houses mean; it is a place of great wealth, however, and very populous.

The jurisdiction of the governor of Madras extends all over the coast of Coromandel, and the western coast of Sumatra: he is likewise captain of the first company of soldiers, as the next in council is of the second: he lives in great state, though his salary is but small; it must be observed, however, that he reaps considerable emoluments from the privilege he has of trading on his own bottom. His usual guard is 3 or 400 black men; and when he goes abroad on any public occasion, he is attended by trumpets, fife, and drums, with streamers flying, accompanied by the council on horseback, and their ladies in palanquins.

The council consist of six persons, who have annual salaries. Besides whom, there are two senior merchants, two junior merchants, five factors, and ten writers; also two clergymen, a judge-advocate, an

attorney-general, two assay-masters of the mint, and a surgeon; all of whom have yearly stipends, which are trifling compared with the advantages they receive by trading for themselves, and other emoluments.

We must not omit to observe here, that in the Black Town there is an Armenian church, as well as several small pagodas, to which belong great numbers of singing girls, who spend half their time in singing to the idols, and the other half in intriguing.

The trade of this colony is in the hands of the Armenians and Jews. The articles the English deal in, are diamonds, chints, calicoes, &c.

This place submitted to the French in 1746, but was restored at the peace. In 1758 they attacked it again under general Lally, but were repulsed by the forces under the generals Laurence and Duper.

Some years since it was computed that the towns and villages belonging to Fort St. George contained 80,000 people, 5000 of whom were Europeans.

They trade to all parts eastward of the Cape of Good Hope; but the largest ships use the Mocha, Persia, and Surat markets, with Bengal and China commodities, and touch on the voyage for pepper, cocoa, drugs, &c. on the Malabar coast. The European goods which fetch the best market price here, are wines, beer, ale, cyder, cheese, gold and silver lace, worsted and thread stockings, lead, flint ware, looking-glasses, &c. &c.

The nabob of Arcot has an elegant villa at a little distance from Madras, supported by pillars instead of walls; the apertures of colonades admit the light in lieu of windows, and open porticos serve the purpose of doors; the stile of architecture is thus elegantly airy and open, and the consequent coolness renders it a luxurious retreat in a climate so exceedingly sultry.

Gingi, or Ginge, which is encompassed with mountains, consists of two towns, called Great and Little Gingi, both of which are surrounded by a wall and five lofty rocks; and on the top of each rock is a strong fortress. From east to west these towns are separated by a wall fortified with cannon, which one of the five rocks defends as a citadel.

Fort St. David is a colony and fort belonging to the English, situated four or five leagues to the south of Pondicherry. In the year 1686 this place was bought, for the consideration of 90,000 pagodas, by the governor of Fort St. George, for the East-India company, and is esteemed a situation of very great consequence to the English. In 1758 it was taken by the French forces under the command of General Lally, who blew up the fortifications; but Fortune afterwards turning her back upon the victors, they were forced to give up to the English most of their possessions. Great quantities of chints, calicoes, and muslins are manufactured here.

To the south of Fort St. David is Tanjore, (the capital of the kingdom of Tanjore) which in 1748 M. Lally attacked, but was repulsed. It is situated in 11 degrees north latitude; and the kingdom is bounded by the ocean on the east, by Trichinopoly on the west, by the river Coleroon on the north, and on the south by the territories of two great personages, styled poligars, or lords. The English have a fort, with land belonging to it, near the mouth of the Coleroon.

When M. Lally made his appearance before this place in 1746, he privately erected batteries at the very time he was pretending to commence a negotiation with the prince, and even fired upon the town; when the inhabitants, inflamed with a just revenge, attacked the French with such spirit and vigour, as to drive them entirely away.

The fort possessed by the English at the mouth of the river Coleroon, and which is named Davecotah, was granted to them by the king of Tanjore.

Bombay is an island, seven miles in length, and in circumference about 20; it is situated in 18 deg. 41 min. north latitude, on the coast of Decan, and forms a most commodious bay; the harbour will hold a thousand ships.

Bombay formerly belonged to the Portuguese, who in 1663 gave it up to king Charles II. on his espousing the

Infanta of Portugal; and the king afterwards gave it to the East-India company.

The climate of Bombay, though within the tropics, is not disagreeable to the constitution of the Europeans; there are but few days in the course of the year in which the weather is very intense; the short hot season precedes the periodical return of the rains: the night-dews, however, are extremely dangerous, and great care should be therefore taken not to be exposed to them. If people would but resolve to live temperately in Bombay, they need not be afraid of the climate, for it is far healthier than many other of the European settlements, though it was once stiled the burial-place of the English: but people have since prudently guarded against the causes of the general fatality which at that time visited them, and there are now some good physicians on the island. They have wet weather at Bombay about four months in the year, which is commonly introduced by a very violent thunder-storm: during this season all trading vessels are laid up. The rains begin about the latter end of May, and end in September, when the black merchants hold a festival, gilding a cocoa-nut, which they consecrate, and commit to the waves.

The land of Bombay is engaged principally in groves of cocoas, rice-fields, and onion-grounds.

The town or city of Bombay, which is surrounded by a wall and ditch, is a mile long, and has a pretty good castle; so that it is well secured, and esteemed one of the strongest places the East-India company have.

The houses of the English here consist in general of a ground floor only, with a court both before and behind, in which are offices and out-houses. Most of the windows are of transparent oyster-shells, which throw a pretty good light; and the flooring of their habitations is a sort of stucco composed of shells that have been burnt; this they call *chunam*, which, being well tempered, and becoming hard, has an elegant polish on it. The houses in which the black merchants reside, are in general ill-contrived, awkward structures. The English church is a very neat building, situated on a pleasant green, round which are the houses of the English. As to the pagodas of the Gentoos, they are such miserable structures, as not to be worthy of a description.

Bombay is divided into three Poman catholic parishes, in the churches of which any popish priest may officiate, except a Portuguese; but against the priests of Portugal the English formed an objection, from an apprehension that these fathers might probably have rather too close a connection with others of their own country in the adjacent settlements belonging to their master. The government is entirely English, subordinate to the India company, who appoint by commission a president and council; and under the immediate direction of the president, who is stiled commander in chief, are the marine and military force. The common soldiers are of many nations, some Portuguese, some Dutch, and others French: what are called Topasses are for the most part black, or of a mixed breed from the Portuguese. There are also regular companies of the natives, who are called *seapoys*.

Here are no disputes about professions in religion: all are alike tolerated. Liberty of conscience, freedom of speech, riches, and honours, distinguish the people and clime of Bombay.

The chief islands near Bombay are Butcher's Island, Elephanta, and Salfette. The first is so called, from great numbers of cattle being kept in it for the use of Bombay; and the second has its name from the enormous figure of an elephant cut in stone, and which, at a distance appears as if alive, the stone being exactly of the colour of that quadruped. On this island, which is nearly one entire hill, and about three miles in circumference, there is a temple hewn from a rock. This real curiosity, which is supported by two rows of pillars, is 10 feet high; it is an oblong square, about 80 feet in length, and in breadth about 40; and its roof is formed of the rock cut flat. At the farther end of this singular structure stand the figures of two giants, the faces of which, however, have been much mutilated; the Portuguese, when they first became possessed of this island,

disfiguring and injuring these pieces of antiquity as much as possible. This curious fabric has two doors, which front each other; near one of them are several images, much disfigured; and there is one image standing erect, with a drawn dagger in one hand, and a child in the other. The other door, which opens on the left hand, has an area before it, at the upper end of which is a range of pillars or colonade, adjoining to an apartment ornamented with regular architecture, round the cornices of which are some paintings. The whole of this temple differs from any of the most antique Gentoos buildings; but no discoveries can be made as to the era when genius and labour produced it.

Salfette lies to the northward of Bombay, being about 26 miles in length, and 9 or 10 broad. Here is a ruined place called Canara, where are several caverns in rocks, which considerably gratify the curiosity of such Europeans as visit them. The soil of Salfette is extremely fertile, and great plenty of game is found in this island, which it must be acknowledged is a most agreeable situation. It was originally comprehended under the regality of Bombay, and of consequence became the property of the English crown when Bombay was given to Charles the Second; but the Portuguese defrauded us of it, though it is so connected with Bombay, that the people thereof cannot well subsist without it, having of necessity almost all their provisions from it. The Portuguese, however, lost this island by the invasion of the Marattas, who inhabit the continent bordering on Bombay: they are a very formidable tribe of Gentoos, who have extended their dominions by dint of arms. Their chief or king resides generally on the mountains of Decan, at a fort called Ræee, reported to be the strongest place in the universe; so well and powerfully guarded is it by nature, being surrounded by steep inaccessible rocks, that no enemy can approach it.

In this well-defended fort the king, or *mar-rajah*, holds his court, and lives in great splendor. He has long been the avowed foe of the Moguls, subahs, and nabobs; making war and concluding treaties just as interest or ambition dictated.

The Marattas are equally bred to arms and agriculture; the use of the former they have learnt of the Europeans, though they depend greatly on targets, which will turn the ball of a pistol, and even that of a musket from some distance. Though their muskets are but very indifferent ones, their swords are excellent, and they use them with great execution. Their targets are quite round, and rise in the centre nearly to a point. The horses on which they ride are small, active, and will go through any fatigue.

As to European arts and manufactures, they receive little encouragement among these people, who prefer those of their own country to the most curious that can be shewn them.

We shall now give an account of the celebrated pirate, Konna Ji Angria; whose dominions were taken from him by the English.

This notorious and common disturber, about a century since, from the humble condition of a private individual among the Marattas, rose to the elevated sphere of admiral, and served in the wars against the Mogul; and being, in consequence of his services, appointed governor of the little island of Severndroog, he took the freedom to seize many vessels that he had once the command of, and in time became a very formidable enemy. He took several of the sea-ports of his countrymen, and extended gradually his depredations near 60 leagues along the coast. The successors of this man, by a series of good fortune on their side, became at length so powerful, and with their power so daring, that they seized not only the vessels of their countrymen, but likewise all European and Moorish ships that they met with; so that the East-India company were under a necessity of taking measures to crush these common robbers; no attempts however against them succeeded till the year 1755, when commodore James, with a small fleet of ships under his command, levelled six of Angria's forts with the ground, and destroyed several ships that were riding in his harbours,

The reader will here observe, that the successors of the first pirate, Angria, were all of the same family and name.

In February 1756, rear admiral Watson and colonel Clive, anchored in the road of Geriah (the strongest place belonging to Angria) and summoned the fort to surrender; but the answer was, that the fort would be defended to the last extremity. Next day, however, some relations of Angria came to the admiral, desiring the indulgence of a few days to consider upon this important matter. This was absolutely refused; and in the afternoon of the same day the fleet weighed and stood in for Geriah harbour. The engagement commenced about two o'clock, and about seven Mr. Clive left the ships with the forces under his command; landed at a convenient place, eastward of the fort, and was soon joined by a considerable Maratta reinforcement.

The bomb vessels threw shells continually into the fort till the next day's dawn; and on this day a second summons was sent to the fort to surrender. The answer was, that the fort would be defended.

A general attack now began, and about two in the afternoon a magazine in the fort blowing up, a flag of submission was displayed about four.

Upon this, the admiral demanded immediate admittance into the fort; but the messenger whom the admiral had sent returning with an answer by no means satisfactory, the attack was renewed, and they then soon hung out a flag of surrender.

Mr. Clive, who had considerably annoyed the enemy by land, then came on board the admiral's ship, in company with an officer from the fort with articles of capitulation, which were agreed to, and Geriah became possessed by the English, with very little loss, there not being above 20 men killed.

Angria, who had prudently escaped from the fort before it was attacked, was now totally ruined. A prodigious quantity of stores and ammunition, rupes to the amount of 100,000 pounds sterling, and effects to the value of about 30,000 more, were found in the fort.

Angria left in the fort his mother, his wife, and two children; and a very affecting scene passed between these captives and the admiral, as the reader will find in the following quotation from captain Ives's voyage to India.

"The admiral with great humanity," says Mr. Ives, "visited these unfortunate captives. Upon his entrance they all made a reverential bow, even to the very ground, shedding many tears. The admiral bade them be comforted, promising them that they should suffer no injury. Angria's mother, strongly affected, cried out, that the people had no king, the no son, her daughter no husband, the children: no father." Mr. Watson replied, "he would be their father and their friend." Upon this, the youngest child, about six years old, innocently taking the admiral's hand, cried, "Then you shall be my father." The admiral, overpowered by the sensations of the moment, turned aside to conceal the tears that were ready to start from his eyes. It was his intention to settle these poor captives at Bombay; but they asked permission to remain at Geriah."

Admiral Watson receiving letters from the English secretary of state, informing him that he might quit the East-Indies, the climate of which had much disagreed with him, he was happy in the prospect of returning home, but was prevented by intelligence from the East-India company that 3000 troops had embarked from France in six sail of the line, and six India ships. Upon this, every preparation was made to receive them, and for six weeks a good look-out was kept from the mail head; but two ships arriving from England, without a syllable about the French armament, it was concluded that the whole had never any foundation; upon which, a body of troops, with a train of artillery, was ordered to march to Golconda, where Mont. Duplex and his countrymen had amassed amazing sums. Before these troops, however, could march, news arrived that the nabob, Serajah Dowlah had taken the English fort at

Cassimbuzar, near Muxadabad, and was soon expected to make his appearance before Fort-William in Calcutta. Scarce had this news been received, when a fresh express arrived with the tidings that the nabob had actually taken Calcutta, and had played the barbarian at the tragedy of the Black Hole; a particular account of which has been already given.

Trichinopoly stands in a plain that was once impassable by plentiful plantations of trees and opulent villas, but which now wears a much less pleasing aspect. The town is about four miles in circumference, fortified with a double wall, and defended by towers; it has a ditch near 30 feet wide. In this town there is a rock about 300 feet high, on the summit of which is a pagoda. Trichinopoly is the key of Tanjore and Madura, and gives them great influence. It was a principal scene of our military operations last war.

In the year 1753, the French made an attempt to take it by surprise; and vainly furnishing that firing alone would terrify the garrison, turned a couple of our 12 pounders on the battery against the town, having previously scaled the outer wall. They were, however, through the exertion of equal judgement and bravery, entirely repulsed, and upwards of 360 Europeans were made prisoners.

Madura, which was taken by the English in 1757, is the capital of the province of Madura, and is a large fortified town.

About 10 miles to the south of Cannor is Tellicherry, where the English East-India company have a well defended factory. The town stands at the back of the fort, and has a stone wall round it. The religion of the place is that of the Gentoos; there are, however, some few black Christians who live protected by the factory. A fine deep purple opium is produced hereabouts.

At Anjengo, which is farther to the south, the English have a factory with a fort and garrison. It is situated on a sandy point of land at the mouth of a small river, which is three-fourths of the year choked up with sand, and not a drop of water fit to be drank can be had within less than three miles of the factory. This settlement is in general more advantageous to the agents of the company, who purchase cinnamon, pepper and chian on their account, than to the company themselves, who only trade for linens of no great worth, and about 50,000 pounds weight of pepper. This place is governed by a queen, who is not allowed to marry.

The port of Carwan is situated about 36 or 38 miles to the south of Goa; and here is an English factory, which stands on a very commodious bay, facing an isle that produces every species of game. The town is surrounded by fertile vallies, yielding corn and pepper in great plenty. In the woods on the mountains are deer, elks, wolves, tygers, monkeys, with wild peacocks and other birds; also bees that are particularly large.

SECTION XI.

The French Possessions in India.

PONDICHERRY, on the Coromandel coast, is the capital of the French settlements in India; it is a large handsome town, situated in 80 deg. 30 min. east long, from London, and 12 deg. 20 min. north lat. The streets are all very regular, and the principal one not less than half a league long. The city is surrounded by a wall, and has six gates, 10 or 11 battions, and upwards of 400 cannon mounted, exclusive of mortars, bombs, &c.

The town stands upon a low ground, and vessels cannot anchor nearer than within about half a league; even the canoes cannot come up to it by some way; so that the Blacks convey persons and mercantile articles to the fleet in flat-bottomed boats.

The chief buildings in Pondicherry are, the house of the governor, the jesuit's house, and an elegant structure in the company's gardens. The houses in common consist only of one story, as is usual in most of the towns of the province. The Gentoos generally sleep in their courts, or on the tops of their houses: these people

ple toil hard in their respective professions, such as weaving, painting, &c. for about a penny per day, and their usual food is boiled rice; for the country, notwithstanding its natural dryness, produces great quantities of that necessary of life, owing principally to the unwearied industry of the Gentoos, who at proper distances dig wells in the fields for refreshing the ground. The laudable spirit of industry in the Gentoos never animates the Mahometans, who are as indolent and lazy as the former are assiduous and careful.

The governor, when honoured with a visit from any great personage, is attended by 300 peons or foot-guards; and when he goes out on any public occasion, he is carried in a palanquin, the canopy of which is embellished with the most superb ornaments.

Pondicherry, which in the year 1693, was taken by the Dutch from the French, and restored to them at the peace of Ryfwick, was in 1751 taken by the English, but restored in 1763.

Previous, however, to the period of 1751, rear-admiral Boscawen was sent out with a squadron, consisting of the *Namur*, the *Vigilance*, *Deptford*, *Pembroke*, *Ruby*, *Chester*, *Dealcastle*, the *Swallow* sloop, and some bomb tenders, in order to lay siege to Pondicherry; there being at that time already in India, under admiral Griffin, the *Princess Mary*, the *Medway*, *Exeter*, *York*, *Winchester*, *Eltham*, *Harwich*, *Preston*, *Medway Prize*, *Pearl*, and *Lively*. It was on the 16th of October, 1747, when the admiral hoisted his flag at Spithead, and he arrived at Fort St. David in July 1748. On the 10th of August, the army were in full motion, and preparing for the siege; the 11th, the French made a shew of about 300 infantry and some cavalry, at an entrenchment they had thrown up, but abandoned it on the approach of the English forces. The English attacked the place with their usual spirit and intrepidity, but were constrained, through the violence of the periodical winds, to raise the siege, after sustaining a loss of 757 soldiers, upwards of 260 seamen, and several engineers.

Karikal is an ancient city and settlement belonging to the French, and lies in 10 deg. 34 min. north lat. about four leagues south of Tranquebar, and 25 south of Pondicherry. The town contains five spacious pagodas, nine lesser ones, four mosques, between 6 and 700 houses, and about 5 or 6000 people.

Tiroumale Rayan Patnam, which is under the jurisdiction of Karikal, and lies to the south of it, is a large town, containing four large pagodas, near 30 lesser ones, four mosques, and about 500 black houses, exclusive of 24 public inns for the accommodation of travellers.

Chandernagore, belonging to the French, is surrounded by a wall, and well fortified; it was, however, reduced by Messrs. Watson and Pocock, in conjunction with colonel Clive. Chandernagore has the disadvantage of being rather exposed on the western side; but its harbour is excellent, and the air is as pure as it can be on the banks of the Ganges. Here is a very considerable manufacture of handkerchiefs and striped muslins: this, however, has not made Chandernagore the rival of Calcutta, whose immense influence enables it to engage in the most extensive commercial undertakings.

S E C T. XII.

Of the Possessions of the Portuguese, Dutch, Danes, &c.

GOA, the principal place belonging to the Portuguese in India, is situated upon an island about 12 miles in length and six in breadth, surrounded by a river of salt water falling into the ocean a few leagues below the town, and forming a most excellent harbour. It lies in 15 deg. 20 min. north lat. and 74 deg. 20 min. east long. from London. The houses, which are of stone, are spacious and handsome; and there are 27 churches and convents, besides a cathedral, a noble hospital, a house of infirmity, and other public buildings.

Two vessels sail annually from Macao to Goa, laden with china and other articles, that are rejected at Canton; the owners of which are generally Chinese merchants.

The island produces a great variety of excellent fruits, though but little corn; and here is a plenty of hogs and fowls.

The slaves of Goa pay great homage to their superiors, whom they attend with umbrellas to shelter them from the sun. The ladies wear rotaries of gold and silver, golden bracelets, diamond pendants, and pearl necklaces. They wear no stockings, but have very elegant slippers.

Roots and fruit, with rice and bread, are the chief food here. The poorer sort of people subsist upon boiled rice, with a little salt-fish, or fruit pickled. Very little butcher's meat is eaten; for the flesh in general is lean and unwholesome.

The religion of the people here is that of the Romish church; and the court of inquisition, that infamous tribunal, proceeds with a most cruel rigour against such as are styled heretics: numbers of Jews and Indian Christians have fallen victims to the inhuman inquisitors; many Gentoos, however, escape these severe persecutions, from their distinguished diligence and industry, which, in this particular, bears great weight with those who are invested with the power of inflicting the dreadful punishments of the inquisition.

It is a reasonable conjecture, that at the time when the natives of Portugal first began to make their foreign discoveries, mankind were not very well acquainted with the political principles of trade, the power and influence of different states, the benefits of victory and acquisition, the mode of instituting, establishing, improving, and preserving colonies, and the emoluments arising therefrom to the parent state. Animated with success, and the rage of conquest, they extended themselves over countries which they could not possibly preserve, without impairing their own strength. Fire-arms, wearing apparel, and various other articles, not being brought to that degree of perfection they have since acquired, the Portuguese could not carry any thing to India but money. Of this they soon grew weary, and by compulsion took away from the natives what before they had obtained in the way of trade.

When the discovery of India first engaged the attention of the Portuguese, they imagined that the appearance merely of their ships in that country, would ensure them the possession of it; that the commerce of it would prove an exhaustless source of wealth to them; and that, by the riches flowing from it, the state would become equal with the most respectable and formidable powers. There were some among them, however, who did not harbour such extravagant and delusive ideas: they, on the contrary, gave it as their opinion, that the result of a pursuit after rich minerals and merchandize abroad, would be a neglect of agriculture and manufactures at home: they ventured to predict, that the state, carried out from its centre by the impulse of an aspiring and ridiculous ambition, would attract the subjects to the remotest parts of Asia; and that such pursuits would ultimately lead to a corruption of morals, and terminate in general confusion. The prophetic observations of these sensible politicians were fully verified and confirmed; for of all the conquests the Portuguese made in India, they possess none but Goa, Macao, and Diu. These remaining possessions, however, are more than sufficient to entitle them to a considerable share in the affairs of India.

Diu, or Dio, is a city situated on an island that bears the same name in the gulph of Cambaya; the island is three miles long, and two broad, and is divided from the continent by a narrow channel. The city is large, and surrounded by a stone wall, well fortified: it has a very safe harbour, and was formerly a place of good trade: the harbour is defended by two strong castles on the land, and every approach on the sea side is prevented by prodigious rocks and cliffs.

The buildings in this city are superior in grandeur to those of most other cities in India, being principally built with free-stone and marble. The city stands on an easy ascent from the great castle, and has five or six fine churches, besides convents, elegantly adorned with paintings, &c. The churches form a most pleasing prospect from the sea, having their beautiful fronts towards it.

In 1670 Diu was attacked and plundered by the Muscat Arabs, who did it so much damage that it hath not to this day recovered its former splendour.

Meliapour is about three miles south of Fort St. George, and was once the most considerable place on the Coromandel coast. The Portuguese raised it from the verge of ruin to a state of opulence and magnificence, but were driven from thence by the Moors, when it became subject to the king of Golconda, but was reduced by the French in 1666; the Dutch, however, in conjunction with the king of Golconda, about four years after, took it from the French; upon which the fortifications were entirely destroyed, and never repaired afterwards. The inhabitants are Gentoos, Portuguese, and Moors, and others of different nations. The Portuguese, after settling at this place, when in its declining state, and beginning to rebuild it, gave it the name of St. Thomas, from an opinion that that apostle was martyred here; and these people finding some bones, concluded they were those of St. Thomas, especially as it was pretended his sepulchre was on a hill at a little distance from the town. These bones they enshrined.

Calicut, the capital of the kingdom of that name, is situated to the south of Tellicherry. It is surrounded by a brick wall: there are about 6000 brick houses, most of which have gardens.

All nations are admitted here, though none have any sway. The sovereign is a brahmin; and this is almost the only throne in India that is filled by a person of this first class. He is styled samorin, or emperor, and is the most potent of the Malabar princes.

The administration of public affairs here is in general bad: no police is established; and the trade, which is loaded with imposts, is almost entirely in the hands of a few of the vilest Moors in India. This was the first place at which the Portuguese landed in 1498, after their discovery of India.

Contiguous to the prince's dominions is the country of the raja of Sarimpatan; the natives of which are a civilized, just, and humane people; and it is said their country was never yet conquered.

Farther to the south is Cochin, a city situated in a kingdom of the same name, in ten degrees north latitude. There are two towns of the name of Cochin, the old and the new; the latter was built by the Portuguese, and had several very handsome houses, as well as churches and monasteries; many of which were destroyed by the Dutch, who took this place in the year 1662, assisted by the king of Cochin, who had been extremely ill used by the Portuguese.

The above monarch, at the time Cochin was taken from him by the Portuguese, had preserved his dominions, which have been repeatedly invaded by the natives of Travancor, a country extending from Cape Comorin to the frontiers of Cochin; and 'tis from necessity he dwells in the Old Town. His revenue is 14,400 livres, stipulated to be paid him by ancient capitulations, out of the produce of his customs.

The king of Cochin lives in the Old Town, which is situated on a river half a league from the sea, and has several pagodas.

In this town is a colony of industrious Jews, who are white men, and absurdly boast that their ancestors were settled here at the era of the Babylonish captivity; they have, however, been certainly here a very considerable time. They have a synagogue, in which their records are preserved with great care.

Cananor is a considerable town in the kingdom of the same name, with a most commodious harbour, and is situated in 12 degrees north latitude. The Dutch, who have on all occasions distinguished themselves by their industry and enterprising genius, have a fort here of great extent. Cananor was originally possessed by the Portuguese, from whom the Dutch took it in the year 1660. It is a very populous town, and is inhabited principally by Mahometan merchants. The chief articles in trade here are pepper, ginger, cassia, ambergris, mirobolans, tamarinds, and precious stones.

At the bottom of the bay there is a large town independent of the Dutch, under the jurisdiction of a prince who can bring 20,000 troops into the field.

At the distance of about a mile from Chandernagore is Chinfura, more generally known by the name of Dughl, and where the Dutch have a fort, but no other possession whatever, the territory round it depending on the government of the country.

Fifty miles to the north of Calcutta is Hugley, where the English had once a factory, but removed it to Calcutta. This is a place of very considerable traffic, particularly in the article of opium. The Dutch have a factory here, erected in an open place, at a small distance from the river. It is defended by a strong fortress, and surrounded by a very deep ditch.

Saumspour is a small place, but celebrated for its precious stones, which are not, as in other places, dug from mines, but found in the sands of the river. Great numbers of people are employed in searching for these valuable articles.

Bandel is a factory for the sale of women to the Moors and Dutch: it was formerly the chief seat of the Portuguese commerce; and there are some miserable wretches remaining, who employ themselves principally in the above shocking traffic, and are at the distance of about 80 leagues from the mouth of the Ganges.

Chaligan is a place where the Portuguese once established a fort of absolute or sovereign power, and formed an alliance with the robbers of different nations, who took refuge here, and acknowledged no subordination to any prince whatever, not even to their own: the Mogul, however, finding them too troublesome to be borne with, sent a force against them, and totally extirpated them. The town has no considerable manufacture: it lies in 23 degrees north latitude, near the mouth of the most easterly branch of the Ganges.

Tranquebar, which is the next settlement on the coast of Coromandel, is claimed by the Danes: it is situated in 11 degrees 16 minutes north latitude, surrounded by a wall, and is about two miles in circumference. It was in 1621 purchased of the king of Tanjore by the Danes.

The streets of the above town are wide, and have a brick pavement on the sides. The habitations of the Danes and other Europeans are of brick and stone, but with only the ground floor; those of the Indians are very mean.

The Danish missionaries here have a congregation, which thrives, though vigorously opposed by the Popish missionaries. They have a school here for youth, who are instructed in the Protestant faith; also, a printing-office, and a paper-mill. The town is supposed to contain about 5000 inhabitants, and hath a most agreeable prospect from the sea. It had a six months siege in 1699 against the king of Tanjore's forces, assisted by the Dutch, and would in all human probability have been taken, had not Governor Pitt sent a reinforcement of English from Fort St. George to its relief.

Thus having described the chief European settlements, we shall make a few general political remarks upon Coromandel.

The fondness for the manufactures of Coromandel, when it first began to prevail here, inspired the Europeans trading to the Indian seas with a resolution of forming settlements there. The first colonies were established near the shore: some of them obtained a settlement by dint of force; most of them were formed with the consent of the sovereigns, and all were confined to a very narrow tract of land; the boundaries of each were marked out by an hedge of thorny plants, which was their only defence. In process of time, however, fortifications were raised, the colonists increased, and each colony flourished in proportion to the prudence and opulence of the nation which founded it. None of the companies that exercised an exclusive privilege beyond the Cape of Good Hope, had any concern in the trade of diamonds; this was left always to private merchants, and fell by degrees wholly into the hands of the English, or the Jews and Armenians who lived under their protection.

Almost the whole trade of the coast of Coromandel is now in the hands of the Europeans; though for some time Coromandel was no object of their attention, it being separated by inaccessible mountains from Malabar, S f where

where these bold navigators endeavoured to settle. Spices and aromatics, which principally engaged their views, were not to be found there. In short, civil dissensions had banished from it tranquillity, security, and industry. At this period, the empire of Bissagar, to which this extensive country was subject, was verging to ruin; the monarchs of that illustrious state falling gradually into an habit of withdrawing themselves from the fight of their people, and of leaving the care of government to their ministers and generals, the governors of dependent provinces threw off their subordination, and had assumed the prerogative of kings, just when the Europeans made their appearance upon the coast.

S E C T. XIII.

Of the Kingdom of Golconda.

GOLCONDA is a kingdom extending 260 miles along the bay of Bengal, in the form of a crescent, and from east to west is about 200 miles in the broadest part. It has Bissagar on the south, the mountains of Gata on the west, and those of Orissa and Balligat on the north. This country is famous for its diamond mines, in some of which the diamonds lie scattered within a few fathoms of the earth's surface, and others are discovered in a mineral in the rocks more than forty fathoms deep. The workmen dig into the rock, and then, by means of fire, soften the stone, and so proceed till they find the vein, which often runs under the rock two or three furlongs. All the earth is brought out, and, after great care is bestowed on it, produces stones of a considerable size, and pretty good water, but of different shapes.

The workmen, in order to discover the situation of these stones, build a cistern of clay; on one side, towards the bottom, is a small aperture, which, when closed up, the earth containing the diamonds is thrown into the cistern: water is then poured in to soften the earth, and afterwards drawn off by means of the small drain. When the cistern is clear from mud, the gravelly sand is critically searched, during sun-shine, for the diamonds, the lustre of the stones themselves assisting the searchers in their endeavours to find them.

The superintendants are obliged to look after the workmen with the utmost vigilance, lest they should be tempted to embezzle any of the precious articles which they are employed to discover.

One of them was once detected in putting a small stone into the corner of his eye; and there have been many instances of their swallowing the diamonds.

The Banyan merchants are the principal persons concerned in this trade, but both are greatly oppressed; the first affecting to be poor, and the latter being so in reality; for the governors do not suffer any to be rich, if it comes to their knowledge. In Vissapour, however, they are more humanely treated.

All diamonds that exceed the weight of a pagoda, are the king's property; but all of an inferior weight appertain to the merchants.

The largest diamond ever found was presented to the Mogul, weighing 279 carats, each carat being four grains.

The making artificial diamonds hath been attempted, but with no proper success, the best of them falling very short of the genuine ones.

The real diamond is not only the hardest gem, but the hardest substance that hath hitherto been discovered; when polished it is perfectly clear, and admirably pellucid, and exceeds all other precious stones in the splendour of its rays, and the lustre reflected from its surfaces; but in the dark it does not shine, as it hath no light of itself.

These ineffable stones are warmed into perfection by the powerful beams of the sun, whose prolific influence gives birth alike to the brightest brilliant, and most inconsiderable weed:

"Behold the self-same sun with varying rays,
"Blush in the rose, and in the diamond blaze;
"We prize the stronger effort of his power,
"And justly set the gem above the flower."

But to return to our general account of the kingdom of Golconda. The chief harbour of this kingdom is Masulipatan; and the country extends from the gulph Vissapour: it once formed a part of a very extensive empire, subject to the emperor of Bissagar, and comprehended nearly the whole of the peninsula, from the northern extremity of Orissa to Cape Comorin.

Golconda city, which is about 238 miles west of Masulipatan, and about 200 north-west of Madras, is situated in a good soil and salubrious air: it has stone walls surrounded with deep ditches, divided into tanks, or ponds of clear water. It has many grand mosques, in which are the tombs of the kings of Golconda. In the year 1614, it suffered greatly by an inundation, when about 5000 houses were washed away, and some thousands of people and cattle perished.

Masulipatan is situated on the north side of the river Nagundi, which separates Golconda and Bissagar, in 81 deg. 40 min. east long. from London, and 16 deg. 30 min. north lat. It was, towards the close of the last century, one of the most thriving towns in India, and the most advantageous of the English factories. The Danes, Portuguese, and Dutch had also factories here, and the customs amounted to 14,000 pagodas per annum, it being the most celebrated mart for calicoes, indigos, diamonds and other precious stones; and there were about 200,000 inhabitants: it is now, however, only a Dutch factory for chints. It is surrounded by a wall and ditch, and towards the land side is a deep moat, over which is a bridge of wood.

In the year 1759, the French were in possession of this city, under the Marquis de Conflans; but it was taken from them by the English forces under the command of colonel Forde. Near the bar the waves of the sea are so rapid, as to make a noise like the cataracts of the Nile, and sometimes have almost as great a fall. The heat here, especially in May, is so intense, that people dare not in some parts of the day stir out of their houses.

Pettipoly, or Penta-pooli, is between 20 and 30 miles to the south-west of the city of Masulipatan; and here the English have a factory. The printed and dyed stuffs of this place are highly esteemed; and in an island opposite to it grows a root, which makes so deep a colour, that it is obliged to be mixed with other colours to make it lively.

The English have a small factory about 100 miles to the south, called Coletoro; and still a little farther south is a factory belonging to the Dutch called Palicate.

S E C T. XIV.

History of Indostan.

THE rich country of Indostan, according to tradition, brought to its soil the first conquerors of the world: but whether Bacchus, Hercules, or Sesostris, were the triumphant victors, we at least know that it proved an exhaustless subject of fiction for the ancient Greeks.

The Indians had a tradition that Bacchus was a native of their country; that he taught the method of pressing grapes, and making wine; that he likewise employed himself in pruning fig-trees, and other fruit-trees of a larger size; that he established a little principality in the country of Nysea, and called his capital Nysea, from the name of his nurse.

We are to suppose that Bacchus was merely the name of an Indian prince who had very superior talents in this early age, and was much beloved by his people. He was a great conqueror, says tradition; he was also a wise legislator, a builder of cities, and institutor of divine worship: he reigned 52 years, died in extreme old age, and was then worshipped as a god: he left his dominions to his children, by whom they were enjoyed for many generations; till at length several revolutions happening, many cities threw off their subjection, and established forms of government of their own.

In the ancient history of the Egyptians we find, that Osiris, the great conqueror of that country, having added Ethiopia to his dominions, passed into Arabia, and from thence into India, where he founded the city of

of Nyfa, and taught the inhabitants the art of making wine: hence we may reasonably conjecture, that Oniris and Bacchus were one and the same.

It is a point agreed upon universally among the literati, that the Egyptians, to strengthen, as well as to diffuse their prevalent opinion that they were the most ancient people in the world, and the arts and sciences were derived from them, were accustomed to transfer whatever they learnt or read, with regard to the memorable actions of the princes of other countries, to those of their own.

The Assyrian, which was the first of the great empires established after the flood, was governed, on the death of Nimus, by his widow Semiramis, founder of the ancient Babylon. This great princess, after the conquest of Bactria, resolved to undertake that of India: the motives of her resolution were the many accounts she had heard of the fruitfulness and riches of the country. Well knowing how important an enterprise would be attended with great difficulties, she ordered a prodigious army, drawn from all the provinces of her extensive empire, to assemble at Bactria: she commanded also the people of Phoenicia, Syria, and Cyprus, to send her a number of shipwrights sufficient to build 2000 barks, which were to be so constructed, as to be taken to pieces, and carried from Bactria to the Indus, where the undeveloped Indians had a considerable naval force.

This political and penetrating queen, knowing that the Indians went to war on elephants, invented huge machines made of the hides of oxen sewed together, resembling elephants, and which were carried on the backs of camels. Every thing being in readiness for action, her majesty marched to invade India; and Stabrobates, then king of the countries bordering on the Indus, prepared to defend his territories. He assembled a most numerous army, and caused 4000 boats to be built of cane, to encounter the Assyrians on the river, having his army and elephants drawn upon the shore ready to support them. The barks of Semiramis however were victorious, 1000 of the Indian boats being sunk, with their crews, and great numbers of persons taken prisoners. Upon this, Stabrobates abandoned the opposite shore, and left the enemy a free passage, in hopes of attacking them with greater success by land. Semiramis, as soon as the Indians wither, converted her fleet into a bridge of boats, over which she marched her whole army, with the counterfeited elephants in front. The Indians were astonished to find that the invaders had elephants, but were soon informed by deserters of the dexterous trick played upon them. A battle ensued, in which the queen had at first the advantage, but was at length totally conquered, and forced to retreat back to her own country in the greatest confusion. According to the chronology of Capellus, this event happened about the year of the world 1970.

The next invasion of India is reported to have been by Sesostris, king of Egypt, who passed the Ganges, and subdued all Asia, even to the ocean. The Ethiopians are also reported to have invaded India; but as the circumstances of such invasion are extremely obscure, we shall omit saying any thing about them.

As to what the ancients have recorded with regard to Hercules, it is probable they might have an Hercules as well as a Bacchus, and that he might excel other men in strength; that he left behind him a numerous offspring, among whom India was equally divided; and that after his death he was worshipped as a god.

If we consider these matters properly, we shall discover that the early natives of India were acquainted with laws, government, and arts, whilst the rest of the earth was savage and desert: prudent institutions preserved these people from corruption, and their grand care was to improve and enjoy the natural advantages of the earth.

When Alexander entered these regions, he found many free cities, and very few kings. A country divided into numberless little states, some of which were independent, and others enslaved, could not make any very considerable defence against the Macedonian hero: he passed the ever Indus without the least opposition,

and, as soon as he was on the other side, received notice that an Indian prince was advancing towards him with a very formidable and well-disciplined army. Alexander, on the approach of this army, which he perceived to be very numerous, immediately drew up his forces in order of battle; but had soon the satisfaction to find that the prince who commanded it, Mophsis, had no hostile intention, but came with that military parade to deliver up his dominions; which, however, after the prince had made his submission to Alexander, were given him back by the latter hero. Ambifar, another prince, followed the example of Mophsis; but Porus, whose dominions lay beyond the river Hydaspes, prepared to defend them bravely; he assembled a very numerous army, in order to dispute the passage of this Macedonian invader across the river. Alexander however forced his passage, and entirely defeated Porus, though with a very considerable loss: he afterwards restored to that prince his dominions, in consequence of the great courage he had shewn in so nobly defending himself and his people. The valour, spirit, and military judgment of this man, were very fully set forth and extolled by the pen of Alexander himself, in epistles that he afterwards wrote on the subject.

Alexander, in memory of this victory, built the city of Nicta, and caused another city to be built, in honour of his horse Bucephalus. He afterwards passed the river Acchnes, and subduing the whole country that lay between it and the river Hydaspes, made a present of it to Porus. He then invaded and destroyed the Cuthæans; took the city of Sangala by storm; attacked the Sibitæ, who soon submitted to him; and marched into the dominions of king Phrygus, who also soon submitted.

The conquests of Alexander in India may be said to have been owing either to an admiration of his transcendent qualities, or to the exercise of superior force: the Indians never betrayed him, but preserved their promises with the most strict honour; and they appear, in all the accounts we have of Alexander's expedition to India, to have been a people well governed, obedient to the laws, and jealous of those advantages that were the result of their respective constitutions; which, duly considered, will appear the highest character any people can deserve.

By following Alexander in his conquests, Sandrocules, an obscure man, but who possessed an happy genius, obtained a complete knowledge of the art of war. This man, by the most enterprising views, deep penetration, resolution, and fortitude, became the instrument of expelling the Macedonians from the provinces they had invaded; and, making himself master of them, united all Indostan under his dominion. But how long he reigned, or what was the duration of the empire he founded, is not known.

The Arabs, at the beginning of the eighth century, overran India, and subjected some few islands to their dominion; contented, however, with quietly trading on the continent, they did not make many settlements on it.

Some barbarians from Khorassan, about three centuries afterwards, invaded India on the north side, and extended their ravages to Gazurat, carrying off immense spoils.

These were succeeded by Gingis Khan, who, at the head of his Tartars invaded the western parts of India, about the year 1200. Afterwards the Patans reigned over the fine country of Indostan.

At the end of the 14th century, Tamerlane, from Tartary, made his appearance before the north side of Indostan, and securing the northern provinces to himself, gave up the plunder of the southern to his officers. He appeared resolved to conquer all India, when suddenly attacking Bajazet, he subdued and deposed him, and found himself master, on uniting his conquests, of the vast tract of territory from the coast of Smyrna to the borders of the Ganges. After his decease great tumults arose, and his posterity were deprived of the rich spoils he had made. Babar, sixth descendant of one of his children, alone survived to preserve his name. This prince reigned in Samarcand, and was dethroned by

by the Usbec Tartars, who obliged him to take refuge in the Cabulistan; where he was received with great kindness by the governor of the province, who furnished him with an army of soldiers, and thus addressed him: "Not to the north let resentment call thee. Gracious heaven has brought thee to the sweet banks of the Indus, that thou mayst be adorned with one of the fairest diadems in the world. Let Indostan be thy object: that country, distracted by continual wars, is in need of a new sovereign. To Indostan then turn thine eyes: there mayst thou erect a new monarchy, and establish a fame adequate to that of the great Tamerlane thine ancestor." Babar admired the sentiments and advice of the governor, whose name was Ranguildas; a plan of conquest was quickly formed, and prosecuted with vigour. Success crowned the great undertaking; and thus a dethroned fugitive prince was ordained by fate to lay the basis of the subsequent power and authority of the Mogul Tartars.

Babar, soon after his conquest, introduced a severe and military discipline; but, however, while he was bringing his subjects under the yoke of despotism, (for though the form of government which he found in India was of an arbitrary kind, yet it related merely to civil concerns, suitable to the customs of the country,) he carefully confined it within such certain limits, as to prevent his successors, though absolute, from being unjust. The chief pillar of his power was a body of 4000 men, who were styled the first *aves* of the sovereign. From this body were chosen the omrahs, who composed the councils of the monarchy, and on whom provinces and considerable immunities were bestowed.

The great Mogul annually visited his provinces, preserving his authority by a parade of great military power; and the Indostan emperors have long supported that external pomp, with which their subjects are more captivated than by justice, as being more impressed with what charms the eye than benefits the mind. Thus by dazzling the eyes of the people, and infusing terror into their souls, the Moguls preserved and enlarged their territories. All Indostan, except a small part of Malabar, became subject to the emperor Aurengzebe, who stained his hands with the blood of his father, his brothers, and nephews. At the death of this monster, who had made the Mogul power much abhorred, it was irrecoverably reduced. Commotions arose as to the right of succession: only one law was generally admitted, viz. that none but those of the family of Tamerlane should sit upon the throne; though at the same time it was well known that every emperor had the privilege to chuse his successor, without having any regard to consanguinity. This indefinite right caused universal confusion; and in this state was the Mogul empire when Kouli Khan invaded it. Discord and tumult prevailed every where; and the general calamity reached the coast of Coromandel, after having 10 years harassed the provinces. The European merchants trembled; and dreading that their trade would be entirely ruined, hit on the expedient of having a territory of their own, capable of containing a number of manufactures sufficient to make up their lading. The first person who thought of this scheme was one Dupleix, who had long studied and was well acquainted with the disposition of the Moguls; he flattered himself he should be able to attain a great sway in Indostan: nothing deterred him in the intended execution of his plan of influence and power, though at so considerable a distance from his native country: nor did any thing engage his attention but the glorious emoluments which would accrue to France from the possession of a new dominion in the centre of Asia. He

soon undertook to dispose of the subahship of the Decan, and the nabobship of the Carnatic. The former becoming vacant in 1748, he in 1750 gave it to Salabat-jing, a son of the late viceroy, after having experienced great weakness in the Indians, and a corruption of manners in the Moguls. The nabobship of the Carnatic he bestowed upon Chunda-sab, a kinsman of the late nabob, and made him give up a vast territory in return for this signal service; the chief acquisition was Seringham, the situation of which gave the French great influence over the neighbouring countries, and an absolute controul over Tanjore. They afterwards got other very considerable possessions, and Dupleix himself was invested with the dignity of a nabob.

The English, the avowed enemies of the French, stirred up a rival, Mohamed-Ali-Kan, against Chunda-sab, nabob of the Carnatic. These princes often engaged, though with a fluctuating success; nor was it easy to furnish for which their victory would ultimately declare; for it was well known that neither of them would submit, whilst he had either troops or money. The English and French ministry, however, caused the two companies to fix certain terms of agreement: they formed a treaty, which commenced with the suspension of hostilities in the beginning of 1755, and which was to end with the establishment of equal territory and commerce on the coast of Coromandel and Orissa; but before this business had received the sanction of the British and French courts, a fresh war broke out between the two nations; the result of which, in India, was, that the French lost their settlements, and left the English masters of the seas.

Of the principal places which the French still retain in India, we have already given a description, in our account of the European settlements.

Of late years the Mogul is a mere shadow of greatness, and used only as a tool by the English East-India company. We have no doubt but it will prove entertaining to many to peruse the petition of a mock monarch, who styles himself "Great Mogul; Emperor of Indostan; the Invincible Conqueror of the Universe; King of the World," &c. &c. &c. to a company of merchants.

"The Humble Petition of the Grand Mogul, to the President and Council at Bengal:

"If this country is to be kept, put me in possession of it, and leave a small detachment of troops with me, to shew that I am protected by the English, and they shall be at my expense; that if any enemy comes at any time against me, I will make such connections in the country, that with my own troops, and the aforementioned small detachment, I will defend the country without any farther assistance from the English; and I will pay them, out of the revenues of the country, what sum they shall demand yearly. If the English will, contrary to their interest, make peace with the vizir, I will go to Dehli; for I cannot think of returning again into the hands of a man who has used me so ill. I have no friends I depend upon more than the English; their former behaviour to me will make me ever respect and regard them. Now is their time to be in possession of a country abounding with riches and treasure: I shall be satisfied with whatever share they please of it. The Rohillas were always enemies to the imperious vizir; they are all my friends."

This singular petition, which was dated from the camp at Banaras, 22d Nov. 1764, was transmitted to the council by Major Hector Monro.

CHAP. XI.

EMPIRE of A V A.

SECT. I.

Situation, Boundaries, and Extent; some Account of the Emperor of Ava's Palace; Natural History, &c.

THIS empire, which is between 15 and 28 degrees north latitude, is bounded on the east by Laos and Siam; on the west by Bengal; on the south by the Indian Sea; and on the north by Tibet.

According to the most authentic writers, Ava is larger than the whole empire of Germany. The king of Pegu was originally in possession of the greater part of it; but two mighty princes of Ava and Siam have destroyed that monarchy; and the king of Ava is emperor of both Ava and Pegu.

Travellers and historians have given no particular account of Ava, though they pretend to know the extent of the country. All we can collect is, that the opulence of the emperor is seen in the magnificence of his palace; "which," says Mr. Hamilton, "is built of stone, and has four grand gates, viz. the eastern gate, called the golden gate, because ambassadors are admitted at it, who make presents to the emperor, when they approach his royal person; the southern gate, or gate of justice, at which people enter who want to present petitions; the western gate, or gate of grace, through which such persons pass as have been honoured with any particular favour, or have been acquitted of any offence unjustly laid to their charge; and the northern gate, or gate of state, through which the emperor passes when he is inclined to shew himself to his people."

Le Blanc, speaking of the palace, says, "In one of the courts stands the figure of a tall man, all of solid gold, with a crown on his head, enriched with rubies of a considerable value: round this figure stand four other golden statues. In another court is represented a giant sitting, all of silver, with a crown of silver on his head, set with rich jewels; and in other courts are other rich statues, formed of various kinds of metal, with crowns on their heads, adorned with rubies and sapphires."

The sovereign of Ava and Pegu has several neighbouring states tributary to him. Pegu, which is within the tropics, is flooded when the sun is vertical; but the slime, left by the waters, gently fertilizes the low lands. As to the higher ground, this is parched with intense heat after the rains have ceased; and the natives are obliged to water their fields by the communication of small channels from cisterns and reservoirs.

The hills of Pegu are clothed with fine wood, and the bamboos are of great utility to the natives.

The fruits of Pegu are oranges, lemons, citrons, figs, pomegranates, bananas, durians, mangoes, goyvas, cocoa-nuts, pine-apples, tamarinds, &c.

The inhabitants use a great deal of rice, and some wheat: they have plenty of garden-stuff, which is a chief part of their food. They have also pulse of various kinds, good poultry, and a variety of fish.

Le Blanc, speaking of their fish, says, "They have a choice of excellent fish; and there are, in some of the royal parks, ponds of clear water, where tortoises of a middle size are kept and fed, the shells of which are a mixture of several colours. With these they work up many things, as cabinets, boxes, and other furniture,

making very handsome work, for the shells are polished like diamonds, and are transparent."

The country produces rubies, small diamonds, and other precious stones; iron, tin, and lead; salt-petre, wood-oil, oil of earth, elephants teeth, sugars, &c. The iron is said to be so excellent in its quality, as to be little inferior to steel.

The Peguans have few horses or sheep, but plough with oxen and buffaloes. Deer are exceedingly numerous here; but though these animals are very fleshy, they are not fat. No place abounds more in elephants than this and the adjacent countries; they compute the strength of their armies by the number and size of these animals.

SECT. II.

Of the Persons and Dresses of the Natives; Fondness of the Women for Strangers. Of the Charity of the Priests.

BOTH sexes are well-shaped, and have good features: the women are considerably fairer than the men, who are of an olive complexion. Both are very thinly clad, and the best among them wear neither stockings or shoes. They let their hair grow long, which they tie on the top of their heads with a ribband, in the form of a pyramid. When the ladies go abroad to pay visits, they wear either a cotton or silken frock, under which is a scarf girded round the waist, and hanging almost to their ancles. This dress is said to have been the invention of a queen of this country, who considered it as the most graceful dress that could adorn the female sex.

The women here are very fond of strangers; and any man, during his stay in the country, may be accommodated with a temporary helpmate: hence most of the foreigners who trade hither marry one of these wives, who are very obedient and obliging to their husbands. The wife goes to market, dresses the victuals, takes care of her husband's effects, and even sells his retail commodities for him. If he proves false, the husband sells her as a slave; and if he proves false, she poisons him.

When a husband quits the country, the wife, at the expiration of a twelvemonth, marries again, provided the husband does not leave her a maintenance by a monthly allowance.

The priests of this country are called talapoins, who recommend charity and humanity as the greatest of all virtues; and indeed these men do honour to human nature, if the accounts given of them be literally authentic. When the master of a vessel happens to be shipwrecked on the coast, and he, by this calamity, becomes the slave of the sovereign, the talapoins humanely intercede for him, and get him into their pious care and protection. In their temples these good men supply a distressed stranger with every thing he wants; and as they are physicians as well as priests, they tenderly take care of sick persons; and, after their recovery, give them letters of recommendation to some other convent on the road they travel.

Real charity and benevolence influence the whole life and actions of these men. They never make any enquiries about the religion of a stranger; it is enough that he be a human being, and that they can relieve his necessities.

They imagine that all religions are good, which inculcate the moral duties, and social virtues. That persecution,

secution, and all modes of worship which are contrary to humanity, or universal philanthropy, are obnoxious to Providence; and that the Almighty delights in being adored by various ceremonials; but that all modes of adoration should be consistent with the most refined benevolence. In fine, their maxims are calculated to infuse in the human heart unbounded charity and general toleration, and to

"Grap the whole world of reason, life, and sense,
"In one close system of benevolence;
"Happier, as kinder in whate'er degree;
"And height of bliss but height of charity.

POPE.

S E C T. III.

Temple, Idols, Sacrifices, Evil Spirits, Magicians, and Festivals.

THE temples, and the idols in them, are grandly embellished. A temple near Syriam has the name of Kiakiack, or god of gods: in this edifice is a large figure lying in the attitude of sleeping, and which is pretended to have lain 6000 years in this posture.

There is another temple near Syriam, which they call Dagon; but none except the priests must enter there; and as soon as Kiakiack dissolves the globe, the idol in this temple, which is also called Dagon, is to gather up the atoms, and create a new world. The priests will not describe the shape or form of Dagon, but say it resembles nothing human.

Le Blanc says, "I saw in one of their temples a silver idol of gigantic size, which, as an oracle, answered questions, and predicted what was to happen. They have an idol also called, Frotoque, of the same stature as the former, though of different composition: this idol, they pretend, intercedes with Kiakiack for the wicked; and once a week they sacrifice a swine and three pullets to it."

Some of the sacrifices of these people are very singular. Having immolated a white sheep, and mingled its blood with meal, on the day of the grand festival of Kiakiack, they distribute it with exhortations, and say it is the blood of Kiakiack. For the celebration of another sort of sacrifice, they purchase a slave at a very high price, who is youthful and handsome, and having purified him, they cloath him in a white robe, and make a public show of him for forty days, telling the people he is the chosen innocent who is to die for their sins: upon this, offerings are presented to him, and petitions made that he will intercede for them before Kiakiack. Areca is plentifully given him each day, and he is attended in his procession from place to place by the sound of brass kettles, flagelets, &c. At the expiration of 30 days, public notice is given by the priests, that in 10 days more he is to set off to approach the holy throne of Kiakiack: at this time they attend diligently on his person, and particularly notice whether he dreads the hasty advance of death. They then drench him well with areca, and, if possible, deprive him entirely of his senses.

On the day of his dissolution they conduct him to a temple, and laying him flat on a stone, rip up his belly, and then taking out his heart, burn it, and offer it in sacrifice to the idol of the place.

The Peguans believe that all the ills which befall mankind, proceed from certain evil spirits that hover about; they therefore worship these demons, in order that they may not be afflicted by them. Some of these spirits, which they call Zibi, enter and torment them, they pretend, when they are celebrating their festivals; inasmuch that those thus possessed by them become so indisposed, as not to be able to eat, drink, or sleep. A magician is then called to their assistance, who is solicited to enquire of Satan how long they are to be thus tormented, and what method is to be used for their deliverance. The magician, after a proper consultation, conducts the afflicted to a field or mountain, in the night-time, and places them in a cavern. Then, by the instruction of Lucifer, he gathers certain herbs,

and burns them in the cave; upon which the evil spirit immediately flies away.

At their grand festivals, persons of high rank attend in their richest apparel, adorned with jewels: here they dance to music, which, from brisk and lively, changes to doleful and melancholic; when, in very plaintive strains, they sing of their ancestors; the men alternately sighing, the ladies weeping, and all acknowledging they shall never equal their good ancestors, who performed such and such great feats. After a general lamentation, they revive their spirits with good food, and resume their merriment.

S E C T. IV.

Of the Emperor; the Homage paid him by his Subjects; his pretended Alliance to the Planets; pompous Ceremony observed when Ambassadors attend him; his Punishment of Offences. Of the Government; Ceremony of proclaiming War, and grand March of the Elephants.

THE emperor of Ava, who is styled sovereign of the white elephant, is almost worshipped by his people: he calls himself the king of kings; and his subjects, either in speaking or writing to him, stile him a god. He is superior to all other sovereigns, as being allied to all the planets; the sun is his brother, and the moon and stars his cousins.

As an opportunity of seeing his majesty's face is the grandest honour that can be conferred, when an ambassador approaches this great prince he is attended by a band of trumpet, while heralds proclaim aloud the honour and happiness he is about to receive. The king is at this time attended by all his ministers, and 200 guards, some with daggers, and others with steel bows finely polished.

Every morning, as soon as the king has breakfasted, his majesty retires to an apartment; from whence he can see the persons who are about the palace, without being seen: and that he may be thoroughly informed of every thing of moment that passes either in the city of Ava, (the metropolis) or in any of his provinces, deputies of great officers and governors are always resident in the palace; for he holds the reins of government entirely in his own hands, and punishes with great rigor such officers and governors as are guilty of mal-practices. When he hears of the commission of any enormous crime, he issues his royal mandate for such offence to be tried by judges of his own choosing; and, if the delinquent be convicted, he fixes the particular punishment to be inflicted, which is the being trampled to death by elephants, or some other equally cruel mode of punishing.

Every town in the dominions of the king of Ava hath a kind of aristocratical government. The governor seldom presides in council, but appoints a deputy and 12 judges, who meet in a large hall, and every man has the privilege of pleading his own cause.

When a man is committed to prison for debt, and cannot or will not pay his creditor, the latter may dispose of him as a slave; and this privilege granted to creditors stimulates the common people to industry.

When the emperor makes war, the heralds proclaim their sovereign's will with flaming torches in their hands, and the governors of provinces are obliged to raise such a number of troops as the state wants in addition to the accustomed military establishment.

A troop perhaps of 1000 elephants are soon seen in full march, the king being seated on his throne upon the back of one of the whitest, attended by all his nobles, with trumpets and other military music founding as they march to the field of war.

S E C T. V.

Of the Kingdom of Araccan, or Arachan.

THIS kingdom, which is called by some the empire of Mogo, is bounded on the east by Ava, on the west by the bay and country of Bengal, and on the north by Tipra; it extends about 400 miles in length, and contains a great number of places, many of which

which the evil spirit

EMPIRE OF AVA.

167

which are uninhabited, from the multiplicity of wild beasts that infest the whole country.

The inhabitants of this kingdom are in general very robust, and are distinguished by having remarkable broad and flat foreheads: they are so fond of this particular in their shape, that when a child is born, they bind a plate of lead on the forehead, which they do not remove till they are satisfied it has had the wished for effect. Their noses are exceeding red, and the nostrils wide; but their eyes are small and quick of discernment.

They are very particular in the colour of their habits, which, among the common people, is generally a dark purple. Those of distinction wear vestments of white cotton, with an apron before them, and a kind of bag behind their backs formed in plaits. Their hair is divided into locks, each of which is tied and ornamented with knots of fine cloth.

The women are much fairer in complexion than the men, but are proportionally robust. They wear a garment made of cotton, which is bound several times round the body, and reaches down to the ankles; and over their necks and shoulders they have a kind of handkerchief made of flowered gauze. The better sort wear a silk scarf on one of their arms, and decorate their hair with a variety of ornaments. They have rings in their ears which are made of glass, and so large, as to hang on the shoulders; and the arms and legs are ornamented with bracelets of silver, copper, ivory, &c.

Their houses are exceeding small, and are made with branches of palm-trees, or canes built upon pillars, and covered with leaves of the cocoa-tree: but the better sort have more spacious buildings. All the houses, however, are made without chimnies, or any convenience for firing, so that they dress their victuals without doors in earthen pots.

They have great plenty of all kinds of provisions, but are exceeding temperate in their diet. Their common drink is made from the leaves of a tree resembling the palm-tree, which if drank new is very sweet, but in a few days will turn sour; and instead of bread, they use rice.

The country in general is very fertile, and produces all kinds of fruit, with various sorts of grain. The climate is very healthful and pleasant in summer, but in winter, it is much otherwise; for the inhabitants are subject to agues, from the great immensity of rains that fall during that season, which continues from April to October.

Here are prodigious numbers of buffaloes and elephants, who testify a particular disgust at those that wear red garments; but these beasts are easily governed by the herdsman, and will readily follow him when they are assembled together, which is effected by the sound of a horn.

The king of Aracean, who is as powerful as any of his neighbours, generally resides at the capital. He has 12 princes under him, whose residences are in the chief cities of the kingdom; and they are permitted to assume the title of kings. The king himself is stiled, "Emperor of Aracean, possessor of the white elephant, with the two Caniques, rightful heir of Peger and Brama, and lord of the 12 kings, who lay their hair of their heads under the soles of his feet, &c." He is seen by his subjects but once in five years, at which time the palace is surrounded with buildings and scaffolds erected on the occasion. The king comes from the palace dressed in the most sumptuous manner, seated in an elegant tent placed on the back of an elephant, richly caparisoned. He is followed by his courtiers riding on elephants, whose harness and trappings are superbly adorned with diamonds and other precious jewels. The king then, with his attendants, rides through the principal streets of the city, after which he returns to the great square before his palace, where his subjects renew their oath of allegiance to him, and the evening is concluded by all ranks of people with the greatest felicity.

They have great numbers of temples and other sacred places, which are built like steeples, and contain many idols, whom they worship. They hold a feast annually in commemoration of the dead, at which time they carry

one of their idols in procession, attended by a number of priests dressed in one uniform, consisting of a long garment made of yellow fatten. The idol is placed in a large heavy chariot; and such is the superstitious notions of the poorer sort of people, that many will throw themselves under the wheels, and others will tear their flesh with iron hooks fastened to the carriage for that purpose: they take great pains to colour these hooks with their blood, and they are afterwards hung up in the temples, and preserved as sacred relics.

Their priests are of three orders, the highest of which is distinguished by wearing a yellow mitre, but the other two always go bare-headed, and they are all prohibited from marrying, on pain of being degraded.

When any persons are ill they send for the priests, who pray with them, in return for which the patient offers sacrifices of fowl, &c. in proportion to their respective abilities. If the patient recovers, it is attributed to the prayers received from the priest; but if he dies, the priest tells their relations that their sacrifices are accepted, but God designs the patient a greater favour in the other world. If the patient appears incurable, the priest thinks it charity to drown him.

When a person of distinction dies, the body is burned, but the poorer sort are thrown into the river. They believe in transmigration, and therefore ornament their coffins with the figures of such animals as they think the most noble. Every family has some peculiar animal, by whom they swear, and whose figure they mark with a hot iron on different parts of their body. Their nuptial ceremonies are performed in the presence of this animal, and they always offer him part of their provisions before they eat.

The Moors are the principal people that trade with the inhabitants of this kingdom, and the commodities they purchase consist of elephants teeth, tin, lead, and timber for building. The ordinary money is shells, or small pebbles, 80 of which are valued at nine-pence; but they have a silver coin estimated at two shillings, in exchange for which they have such a number of shells as to become burthenfome to the possessor.

Aracean, the capital of this kingdom, is large, and well fortified: it is situated in a valley, and is 15 miles in circumference. It is enclosed by very high stone walls, and surrounded by a ridge of steep craggy mountains, so artificially formed as to render a penetration almost impregnable; besides which, there is a castle within strongly fortified. The city is well watered by a fine river that passes through it in different streams, and at length forms two channels, which empty themselves into the bay of Bengal.

The number of inhabitants in this city are estimated at 160,000, exclusive of foreigners. The houses in general are small, and built of bamboos; but those of the better sort are spacious and handsome: in it are upwards of 600 idol temples, most of which are spacious buildings elegantly ornamented. The palace is exceeding magnificent, being decorated with the most costly ornaments. The apartments are lined with various kinds of wood that discharge the most agreeable fragrance; and the roofs of those belonging to the king are covered with plates of gold. In the centre of the palace is the grand hall, which contains a canopy ornamented with wedges of solid gold, resembling sugar-loaves. Here are likewise several idols of the same metal as large as life, and ornamented with diamonds and other costly jewels. In the center of the hall is a cabinet of gold, supported by a large stool of the same metal, and overlaid with diamonds and other precious stones. This cabinet contains the two Caniques, or famous pendants of rubies, which the king wears at his coronation, and by which he preserves a superior authority over his vassal princes.

Adjoining to the palace are spacious stables for the king's elephants, tigers, horses, &c. and near it is a considerable lake with small islands, inhabited chiefly by priests. This lake is so situated as to be a security to the inhabitants of the city, should they be reduced to the necessity of flight by any attack from an enemy; for by cutting a bank which surrounds it, they might overflow the city, and retire to the islands.

The

The suburbs of this city are very extensive, and the adjoining countries delightfully pleasant. The villages, mountains, &c. are beautifully diversified with fields of different kinds of grain, intermixed with pieces of water, and numerous flocks of cattle.

The Dutch have a factory in the neighbourhood; and at many of the shops in the city are to be purchased some of the richest commodities in Asia. The Moors are the principal people that trade here, who often obtain considerable possessions by purchasing diamonds, rubies, and other precious jewels.

Exclusive of Araccan, the chief city, there are many others of considerable note in different parts of this kingdom, as also many capital towns remarkable for traffick; the most material of which are,

Orietan, which is situated on a branch of the river to the south-west of the city of Araccan. This is one of the 12 capital cities, and is governed by a viceroy, who assumes the title of king, and receives a crown from the king himself. In the neighbourhood of this city is a large mountain, on which is a fortified place for the confinement of state prisoners, or other distinguished criminals. There is another mountain called Pora, on the top of which is placed their principal idol, which is worshipped by the king himself on a certain day once in the year. Between the cities of Araccan and Orietan is a spacious river, the banks of which are delightfully shaded with tall trees, that form as it were an harbour; the pleasure of sailing under which is considerably heightened by the multiplicity of peacocks that are continually moving from one tree to another. These birds are exceeding beautiful, and fully answer the fine description of them given in the book of Job, which is thus elegantly paraphrased by Dr. Young;

How rich the peacock; what bright glories run
From plume to plume, and vary in the sun!
He proudly spreads them to the golden ray,
Gives all his colours, and adorns the day!
With conscious state the spacious round displays,
And slowly moves amid the waving blaze.

Rama is a city of considerable note, but is little resorted to on account of the great danger in getting to it either by land or water; the former being dangerous from the number of wild beasts with which the mountains are infested, and the latter from its being subject to sudden tempests.

Dobazi is another large and populous city; but is chiefly remarkable for having a good harbour, and a spacious river, by which great trade is carried on with the neighbouring places.

Dianga is a large town situated 120 miles north of Araccan; the inhabitants of which are chiefly Portuguese fugitives, and are indulged with very considerable privileges.

Peroem or Peom is a town of great trade, and has a very convenient harbour. It is the residence of a governor, who keeps a grand court, and exercises the absolute authority of an eastern monarch.

SECT. VI.

The Kingdom of Tipra.

THE kingdom of Tipra, or Tipoura, is bounded by the empire of Ava and part of China to the south and east, by Independent Tartary to the north, by Araccan to the south-west, and by Indostan to the west. Tavernier informs us, that to cross it requires 15 days: it is exceedingly hot, being under the Tropic of Cancer; the air is nevertheless pure and salubrious; but the water is so bad that it occasions the throats of the inhabitants to swell to a prodigious size. The sovereign, and the nobility ride upon elephants, or are carried in palanquins, but the common people in travelling make use of horses, or oxen indiscriminately. The accommodations for strangers are bad, and the behaviour of the natives rude and unpolished; the subjects of this kingdom pay no taxes, but in lieu thereof labour annually one week for the king, either in his mine or his silk works, from whence alone his revenues accrue. He exports gold and silver to China in ingots,

and in return receives silver, which is coined into two species of currency of 20 pence and 22 pence value each: gold is coined into aspers, which are worth about five shillings a-piece. The sovereign of this country is tributary to the king of Araccan. Geographers say, that the river Caipoumo runs from Chiamay lake through this and several other kingdoms, till it disembogues itself into Bengal bay. We have, however, more respecting this country said by travellers from hearsay, or conjecture, than from any authentic credentials. Concerning some of these we may justly exclaim:

"Freely they censure lands they ne'er explore,
"With tales they learnt from coasters on the shore;
"As Afric's petty kings, perhaps, who hear
"Of distant states from some weak traveller,
"Imperfect hints with eager ears devour,
"And sneer at Europe's fate, and Britain's pow'r."

SECT. VII.

The Kingdom of Boutan, or Lassa.

BOUTAN has China on the east; Tibet, and the Mogul's dominions on the west; Tartary on the north; and Afem on the south.

Tavernier, who is the only traveller that gives an account of this kingdom, says, that when the merchants of Patna and Bengal come to the foot of the Naugracut mountains, they are carried over them on the backs of women; there being three women, who alternately relieve each other, to every traveller. The baggage and provisions are carried by goats, who climb the mountains with wonderful agility, and are able to bear 150 lb. weight. They are a week in passing these mountains; the women, for their trouble, receive to the value of a crown each, and the same sum is paid for every loaded goat.

The dress of both sexes is a kind of felt in winter, and suttan in summer. They wear a high cap adorned with pieces of tortoise-shell, or boars-teeth, which they deem grand embellishments. The women decorate their necks with necklaces of amber or coral, and both male and female wear bracelets on the left arm, from the elbow to the wrist. They are exceeding fond of spirituous liquors, and conclude their entertainments by burning amber. Here is plenty of corn, rice, pulse, grapes, wild mustard seed, rhubarb, musk, furs, coral, &c.

The natives are gross idolaters, and more particularly venerate a cow, which they term "the nurse of mankind."

These people have had the use of fire-arms time immemorial; from inscriptions on some of their cannon, they appear to be 500 years old. None are permitted to quit the kingdom, without a special licence from government; nor must any one take a musket with him, unless he gives proper security to bring it back again. On the backs of their elephants and camels, they place small cannon, which carry half pound balls. The king is always in fear of treason, and has a guard of 8000 men constantly attending him, though at the same time he is vain enough to call himself a god, endowed with the attributes of "invincibility, and invulnerability!" Thus does vanity impose upon itself and its admirers;

"For the dull world most homage pay to those,
"Who on their understandings most impose;
"First, man creates, and then he fears the elf,
"Then others cheat him not, but he himself:
"He hates realities, and hugs the cheat,
"And still the only pleasure's the deceit,
"So meteors flatter with a dazzling dye,
"Which no existence has but in the eye."

The people who have flat noses are strong and well made, but the women are more robust than the men. Silver mines are said to abound in this country, and, by the king's order, silver money is coined here, each piece being of the value of half a crown, and of an octagonal form: but they have no gold, except what is brought into the country by merchants in the course of trade.

SECT.

S E C T. VIII.

The Kingdom of Asem, Azem, or Acham.

ASEM has China to the east, Indostan to the west, Tipra to the south, and Boutan, with part of Independent Tartary, to the north. This country, in the reign of Aurengzebe, was conquered by the Moguls, who discovered it by navigating the river Lacqua, which has its source in the lake Chiamay, and discharges itself into the Ganges. The abovementioned celebrated Indian lake is 180 leagues in circumference, and lies in 26 degrees north latitude.

This country, besides being one of the most fertile in the universe, is rich in mines, which produce both the noblest, and the most useful metals, viz. gold, silver, steel, iron, lead, &c. There is plenty of the most delicious animal food, but dog's flesh is deemed the greatest dainty. They make no wine, though they have excellent grapes, which, when dried, are used in making brandy. The lakes of this country are of a saline quality, and the scum which rises to their surface is converted into salt.

From the leaves of what is called Adam's fig-tree, another kind of salt is extracted, and a ley is made, which renders their silks admirably white.

The natives pay no taxes whatever to government, the king contenting himself with the sole possession of the valuable mines which his country contains; nor are those mines worked by the natives, but by slaves which he purchases of his neighbours.

Every subject hath a house, a large piece of ground contiguous thereto, and an elephant to carry his wives, of whom he is permitted to have four. Previous to marriage the Asemians inform the women minutely of what they expect them to do. The females being thus precisely instructed in their duty, seldom disoblige their husbands. The inhabitants towards the north have good complexions, but those who dwell southerly are rather swarthy. All have very large holes bored in their ears, from whence descend heavy pendants of gold and silver. They wear their hair long, have a cap upon their heads, and go naked except about their middles. They adorn their arms with bracelets, which are buried with them when they die. Their gold is current in ingots, but they have pieces of silver coin of two shillings each in value. They have great plenty of gum lacque, which they export to China and Japan, to varnish cabinets, chests, &c.

The metropolis of this kingdom, and the residence of the king, which lies in 25 deg. 33 min. north latitude, is named Kemmeroose, or Guerguen; and the city of Azoo is the royal burial place. When any king is buried in the grand temple, his favourite idol is buried; this always being either of gold or silver, the vaults are filled with immense treasures. The people imagine that the righteous have in the other world plenty of what they desire, but that the wicked suffer all the miseries of hunger and thirst. Foll of this notion, and not entertaining any very high idea of the morality or piety of their monarchs, they bury with them all kinds of edibles, great riches, several of their wives, officers, elephants, slaves, &c. lest they should fare worse in the other world than they did in this. It is imagined that the Chinese received from the people of Asem the invention of gunpowder, though they have since thought proper to arrogate it to themselves.

Before we conclude, it may be proper to observe, that the following places near the coast of Ava are reckoned in the Pegu dominions.

1. The island of Dola, which has a good harbour, and where 20 houses are appropriated to the purpose of taming elephants for the use of the king of Pegu.

2. Cofimin is a fertile island; the houses of the natives are built on frames of wood, and ascended to by ladders, on account of the furious tygers with which this country abounds. The inhabitants go from hence to Pegu in boats, in which whole families reside all the year. This country produces figs, oranges, cocoa-nuts, wild boars, parrots, asses, &c.

3. Meden, a tolerable town, where a market is kept on the water in boats, the commodities being shaded from the scorching sun beams by umbrellas.

4. Negrais, a town and cape on the coast, due westward from Pegu, from whence it requires about 10 days to sail. The harbour is good, but a shelving bar renders its entrance disagreeable and dangerous.

5. Diamond island, near Cape Segrais, is celebrated for two Pagan temples; the one called the temple of the "god of the afflicted;" and the other the temple of the "god of the atoms of the sun." This island is low, barren, and rocky; but the chief ecclesiastic of the kingdom resides here. He is greatly venerated by the people, and takes the right hand of the king, who, on his demise, is obliged to attend his funeral with his whole court, and to defray all expences thereby incurred.

C H A P. XII.

M A L A C C A.

S E C T. I.

As Situation, Boundaries, Extent, and Division into petty States; the Coasts, Hills, and Deserts of the Kingdom of Malacca; the Vegetables and Animals; Account of the Natives; with a Remark on the Purity and Elegance of their Language.

MALACCA is a peninsula, situated between the second and eleventh degree of north latitude, and is bounded by Siam on the north, by the ocean on the east, and by the freights of Malacca on the south west; being about 600 miles long, and 200 broad. It is separated into small kingdoms, viz. Malacca, from which it hath its name, Johor, Patana, Sincapour, Pahan, Trangano, Pera, Queda, and Ligor. Some of these are independent states under different despotic princes, and others are tributary to the king of Siam.

The continent of Malacca is said to have been originally joined to the island of Sumatra, and to be the

Aurea Chersonesus of Ptolemy. The coasts of the kingdom are flat, marshy, and unhealthy; and the inland parts of the country consist of scarce any thing but barren hills and dreary deserts; so that it produces nothing for a foreign market, except a small quantity of tin, and some elephants teeth; the common necessaries of life are produced in gardens; and small quantities of pease and rice are reared in such parts of the mountains as appear to have any tolerable soil. The natives have a supply of provisions from Sumatra, Bengal, Java, Siam, and Cambodia. Here is, however, a variety of fruits, and particularly the mangostan, which is very delicious, and resembles a pine-apple. Here are cocoas in abundance, and a great plenty of aloes; and as to pine-apples, there are no better in the universe than are to be had here. The ramboitan, a fine fruit, is about as big as a walnut, with most delicious pulp; and the durian, though not pleasant to the smell, has a very agreeable taste.

Sheep and bullocks are scarce here; but pork, poultry

U u

and

and fish are pretty plentiful. The wild animals of the country are tigers, wolves, &c.

The natives, who are called Malays, are of a tawny complexion; and those inhabiting the inland parts of the country, are remarkable for the ferocity of their manners. The men go naked, except having a piece of cloth round their waist.

The women of Malacca, who have their hair very long, and are extremely proud, wear a loose silken garment embroidered with silver or gold. Both sexes have jewels in their ears.

It may be truly said, that while nature had done every thing in favour of the Malays, in their pristine state; while she had bounteously provided for them, by placing them in a serene and salubrious clime, where refreshing gales and cooling streams assuage the heat of the torrid zone; where the soil teems with delicious fruits; where the trees are clothed with a continual verdure, and the flowers breathe their odours; while nature, I say, had done these things for the Malays, society did them every possible injury: for such has been the influence of an arbitrary government, that the natives of the most happy country in the globe have become remarkably ferocious in their manners. The feudal system, which was first concerted among the woods and rocks of the north, has reached the serene regions of the equator. The Malays, as we have already observed, are governed by despotic princes: this scene of arbitrary domain occasioned a general savageness of manners: in vain did bounteous heaven bestow her rich blessings on the Malays; these celestial gifts served only to make the people ungrateful and discontented. Masters let out their services, or rather those of their dependants, to the highest bidders, heedless of the loss which husbandry would suffer in the want of hands.

After the Portuguese had taken possession of the chief city of these people, the latter, ill brooking a submission to their new masters, either retired into the inland parts, or dispersed themselves along the coast. Having lost the spirit of commerce, they imbibed that of conquest, and subdued a large Archipelago on their coast, while the Portuguese rendered Malacca the most considerable market in India. Lost to all commerce, I say, they fell into every excess of fierceness and barbarity. The men are never without poignards, with which they commit murder, when harm is least expected.

But we must in justice say, that some there are, who are polished, well-bred, humane people; who distinguish themselves by their talents, and particularly in the use of a language esteemed the most pure, nervous, harmonious, and copious of any spoken in the Indies: they study it with great care; and many do honour to its natural graces, by furnishing elegant poetic compositions.

SECT. II.

Account of the City of Malacca.

THE city of Malacca is said to have been founded upwards of 200 years before the arrival of the Portuguese in 1509; and in the year 1511, Alphonso Albuquerque subdued the city, after it had made a most vigorous defence: he plundered it of immense treasures, vast magazines, and whatever could contribute to the elegancies and pleasures of life, and then put the prince to death: the king of Siam, however, enraged at this cruelty, afterwards took the city by storm, assisted by other princes equally incensed against the murderer: but the Portuguese afterwards retook it, and built churches, monasteries, a castle, and a college for the Jesuits. In the year 1606 the Dutch, in conjunction with the king of Johor, began to be very troublesome to the Portuguese, and, after a series of hostilities for the space of 35 years, deprived them of it in 1641.

The means they adopted of obtaining possession of the city was as follows: finding that considerable disputes had subsisted between the king of Johor and the Portuguese inhabitants, the Dutch instantly formed a design of attacking and reducing the place. Accordingly they fitted out a formidable squadron of ships at Batavia, and entered into an alliance with the king of

Johor, who attacked the city by land, while the Dutch invested it by sea; but the invaders finding there was no possibility of reducing it, and hearing that the governor was a very fordid, worthless fellow, the Dutch, by letters secretly conveyed to him, offered him a considerable premium, if he would facilitate the surrender of the fort. The bribe was accepted; the Dutch soon entered the place, and, to save the payment of the premium, murdered the governor for his civility; the due reward of a traitor, but mark of equal baseness in the bribers.

The city of Malacca is an extensive and populous place, surrounded with a stone wall and bastions: many of the streets are spacious and handsome, and are shaded with trees on both sides: the houses stand pretty close to each other, and are built chiefly of bamboos, though some of them are of stone. The governor's house is handsome and commodious, and is situated in the fort, garrisoned by 200 Europeans. The harbour is one of the best and safest in that part of the globe, and receives vessels from most parts of the Indies. When possessed by the Portuguese, the city was remarkably opulent, being a grand mart for precious stones and gold; and before the Dutch made Batavia the chief place of their commerce, it had all the rich commodities of Pegu, Coromandel, Siam, Banda, and other countries: but at present its commerce is not very considerable.

SECT. III.

Of the Kingdoms of Johor, Sincapour, Patana, Pahan, and Trangano.

THE kingdom of Johor, which is about 100 leagues long, and 80 broad, is the next country to the north of Malacca, and is washed east and west by the ocean: it lies in one degree north latitude.

The country, which is woody, abounds with tin, pepper, elephants teeth, gold, aquila wood, canes, citrons, lemons, &c. and among the quadrupeds are deer, cows, wild boars, and buffaloes.

The natives are reported to be cruel, treacherous, lazy, and lascivious. The common people, of both sexes, wear nothing more than a piece of stuff round their waist; the females in a superior degree of life, wear calicoe garments fastened with a silken girdle: they paint their nails yellow, and the longer they are, the more genteel. The islanders live principally upon fags, fruits, roots, and poultry; but those natives who reside on the coast, subsist for the most part upon fish and rice brought from Java, Siam, and Cambodia.

There are among these people about 1400 Chinese families, who are distinguished for their industry, and carry on a considerable traffic.

The natives, who are a mixture of Mahometans and Pagans, have priests sent to them from Surat.

The Johor islands lie to the north-east of Cape Romano, but produce nothing fit for the carrying on commerce. Pulo-Aure, one of them, is peopled by Malays, who are said to form a sort of republic, headed by a chief. In this island are several mountains, which produce plentiful plantations of cocoa-trees. Articles in trade are purchased here with iron, and the people have the character of being very honest, friendly, and hospitable.

Sincapour, or Sincapora island and town, lie at the southernmost point of the peninsula of Malacca, and give name to the south-east part of Malacca straits. Here is a mountain which yields excellent diamonds, and sugar-canes grow to a great size. The soil of Sincapour is fruitful, and the woods produce good timber for ship-building.

Patana, which is about 60 miles long, lies on the eastern coast of the gulph of Siam: its port had once a considerable traffic with Coromandel, Malabar, Goa, China, Tonquin, and Cambodia; but the traders unhappily finding no restriction put upon the commission of piracies and murders, were under a necessity of withdrawing their commerce, and turning it into another course, highly beneficial to Siam, Malacca, and Batavia.

Patana abounds with grain and fruits; and here are buffaloes,

buffaloes, fowls, and some of the most beautiful doves
ever seen; the wild animals are tigers, monkeys, ele-
phants, &c.

The king of Patana can bring 18,000 troops into the
field, and has more vessels than any of the other neigh-
bouring sovereigns. The Chinese bring hither a variety
of articles in trade, and take considerable returns.

The natives, though proud, are kind and obliging,
and are remarkable for their sobriety.

Pahan lies to the south of Patana, on a river of the
same name, in which there is much gold-dust found.
People of fortune reside in the capital of Pahan, situated
about 150 miles north-east of Malacca: the city, which
is but small, has the appearance of a garden, from the
number of cocoa and other trees planted in the streets.

The king of Pahan's palace is a wooden structure,
and the other buildings are in general of reeds and
straw.

The river here washes the foot of Malacca hill, and
along its sides is planted pepper. The adjacent country
is low, woody, and well stored with game: Aquila
and Calamba wood, coarse gold, camphire, nutmegs,
&c. are also produced here. According to Sir E.
Michelburne, Pahan is well peopled, and carries on a
considerable traffic; but the natives who are Pagans and
Mahometans, are reported to be the most arrant cheats
in the world.

Trangano is situated next to Pahan, and is a fine
healthy country: its hills produce a plenty of rich fruits,
such as oranges, lemons, limes, darians, mangostans,
mangoes, &c. and the valleys teem with sugar-canes
and corn. Gold and pepper are likewise produced here,
and are principally exported by the Chinese resident in
this country.

The prince's palace stands on the banks of a fine

river near the ocean; and the Chinese carry on a con-
siderable trade with the adjacent countries.

SECT. IV.

Of Pera and Queda.

THE kingdom of Pera, which is a mountainous,
woody country, is famous for its produce of tin,
there being more found here than in any part of India.
Its capital, Pera, lies at the bottom of a bay about
150 miles north-west of Malacca. There are some
hideous defarts in this country, abounding with wild
elephants, tigers, &c.

The people are mere barbarians, and of a most trea-
cherous disposition.

Queda is a very small territory; its capital, Queda, is a
sea-port town, distant from Patana 140 miles. When
a foreign merchant comes here, the king pays him a
visit in person, not to compliment him on his arrival,
but to receive presents from him: the presents, how-
ever, are not made till the visit is repaid; and then the
king honours the merchant with a seat near his royal
person: his majesty at the same time chews betel,
and putting it out of his mouth on a small golden plate, the
merchant takes it with great respect, and puts it into
his own mouth: this is an established custom, and must
always be strictly observed.

The natives of this place are divided in their religion,
some of them being Mahometans and others Pagans;
and in their dispositions, they are in general very de-
ceitful, treacherous and cruel. Its chief produce is tin,
pepper, elephants teeth, canes and damar, the latter of
which is a gum that is of excellent use in the making
of pitch and tar.

CHAP. XIII.

EMPIRE of SIAM.

SECT. I.

*Etymology of its Name, Situation, Extent, Divisions,
Sub-divisions, &c.*

SIAM was so named by the Portuguese; the Malays
call it Tsiam: and as Siam or Tsiam signifies Free
in the Peguan language, it appears to be a transla-
tion of the name of the inhabitants, viz. Tai, or Free-
men; though they have long been deprived of their
liberty.

This kingdom, which is surrounded by mountains, is
bounded on the east by Cambodia and Cochinchina, on
the west by the sea, on the north by Pegu and Laos,
and on the south by Malacca and the bay of Siam.

The general situation of Siam Proper (by some called
Upper Siam, to distinguish it from the Lower, and
which contains seven provinces, viz. Profeloue, San-
gueloue, Lacontai, Campengpet, Coconrepina, Peché-
bonne, and Pichia) was determined by the observations
made by the jesuit missionaries; but its dimensions are
uncertain. It is not known in what part of the penin-
sula of Malacca Siam Proper commences, nor how far
it reaches beyond it. Some geographers say, the most
southerly part is situated in about the 11th deg. of
north lat. and is surmised to be above 550 miles long,
and 250 broad; though in some parts it is not more
than about 30 miles in breadth.

The chief river of Siam is the Menam, or mother of
waters, which discharges itself into the gulph of Siam:
the source of this river is unknown to most of the in-
habitants, or they misrepresent it, in order to magnify
its origin. Another great river is called the Mecon;
this passes through Laos and Cambodia, and falls into

the Indian ocean: and a third river, named the Tena-
ferin, falls into the bay of Bengal, forming the isle of
Merguy, which has a most excellent harbour.

Siam being, as we have already said, surrounded with
mountains, and having few hills within the intermediate
country, is one wide extended plain, with a great river
branching and running through it from north to south.
These mountains form two huge chains, one on the
west and the other on the east side, diminishing gradually
as they reach southward. They yield diamonds, sa-
phires, and agates.

The seven provinces of Siam Proper, or Upper Siam,
have their names from their principal cities, which are
situated near the sea-coast, or on some of the rivers.

As to the climate of Siam, the winter here is dry, and
the summer wet. Were it not that the sun draws clouds
and rain, and the wind blows from one pole when the
sun is declined towards the other, the torrid zone would
doubtless be uninhabited. Thus in Siam that great
luminary being to the south of the line during winter,
the north winds blow continually and cool the air. On
the contrary, in the summer, while he is to the north
of the line, and vertical to the Siamese, the south winds
reign in their turn; and thus either cause incessant
rains, or at least dispose the weather to be rainy. It is
these winds the Portuguese call monsoons, and other
nations monsoons: and hence it is vessels have such
difficulty to approach or depart from the bar of Siam.
Thus the bleak winds of the frigid zones temper the
excessive heat of the torrid, and the warm breezes of the
torrid flow through and give genial warmth to the tem-
perate, till they reach the frigid, and in some measure
qualify that extreme cold, which in those inhospitable
regions benumb nature, for

- "As five zones th' ætherial regions bind,
 "Five correspondent are to earth assign'd,
 "The sun with rays directly darting down,
 "Fires all beneath, and fries the middle zone;
 "The two beneath the distant poles complain
 "Of endless winter, and perpetual rain;
 "Betwixt th' extremes two happier climates hold,
 "The temper that partakes of hot and cold."

The principal places in Siam Proper, are Chantebon or Liam, which is situated near the gulph of Siam, at the mouth of a river to which it gives name: it is about a day's journey from the sea, and has some considerable inland trade.

Bankaloy is situated on a river near the bar of Siam. The king himself is the sole merchant belonging to this place, for all the elephant's teeth, Japan and aquila wood is remitted to him. They make here the exquisite fauce called ballichang, on which the epicures of Siam regale; for many of the Siamese fall martyrs to a luxurious appetite.

- "It is a shame, that man, that has the seeds
 "Of virtue in him, springing unto glory,
 "Should make his soul degenerate with sin,
 "And slave to luxury."

This fauce is a composition of cod, dried shrimps, pepper, salt, sea weed, &c. pounded together, and beaten to the consistency of a paste. In the above mentioned river are two small islands belonging to the Dutch.

Bangkok, situated about 50 miles south of Siam, is remarkable for its large gardens, some of which extend three or four leagues in length, and are filled with trees that produce the most delicious fruits. The river Menan runs from hence to Siam, and its banks are adorned with many pleasant villages, the houses of which are made of bamboos, and erected upon stakes, on account of the inundations of the river, which would otherwise sweep them away.

At Louvo, the king of Siam passes several months of the year, for the sake of having more freedom than in the metropolis, where he is obliged to be shut up, that his subjects may not lose that profound respect which they entertain of him, by seeing him too often; for solitude and indolence are the chief characteristics of his dignity.

- "Upon a couch of down in these abodes,
 "Supine with folded arms, he thoughtless nods;
 "No passions interrupt his easy reign,
 "No problems puzzle his lethargic brain;
 "But dull oblivion guards his peaceful bed,
 "And lazy fogs bedew his gracious head:
 "Thus at full length such pamper'd monarchs lay,
 "Basking in ease, and slumbering life away."

Between Louvo and Siam there is a communication, by means of a large canal, on each side of which are extensive plains abounding with rice.

The king's palace at Louvo is a brick building, but exceeding capacious, and surrounded by fine gardens; the roof is covered with yellow tiles, which, when the sun shines upon them, appear like gold. The town itself is populous, large, and pleasant; and stands about the distance of 14 leagues from Siam.

Probat stands on a branch of the river Menan, about 65 miles north-east of Louvo. The king of Siam annually repairs hither in grand procession, to worship a mark in the rock, which is pretended to be the print of the foot of their idol Sommona-Codom.

Pourcelano, 320 miles from Siam, was formerly a considerable city, defended by 14 bastions, but is run to decay.

Menang-tan, six miles to the north of the last mentioned place, is celebrated on account of the pilgrimages made to it by many devotees of Siam, Pegu, Laos, &c. who repair hither to pay their respects to one of the above mentioned idol Sommona-Codom's teeth, which is here preserved with great care.

Tennasserim, about 200 miles from Siam, is a place of considerable trade, situated on a river, to which it gives name.

Cul is a town near the former, from whence the king of Siam receives great quantities of tin and elephants teeth. Margui, about 140 miles south-west from Siam, is situated in an island near Tennasserim, and deemed the best port in India. The commodities sold here are cloves, nutmegs, mace, verzina, nypha, benjamin, &c. nypha is a strong white wine distilled from the blossom of a tree; besides which, the country produces rice, tin, elephants teeth, aquila wood, &c. There was once an English factory here, which the East-India company took great pains to ruin and abolish, as it interfered with their emoluments.

Ligor is the metropolis of a country of the same name, which was formerly an independent state of itself; but a few centuries ago was conquered by the Siamese. It is about 380 miles south of Siam, and contains a Dutch factory, which is built of brick; but the houses of the natives are erected with bamboos thatched with reeds. At about three leagues distance there is an uninhabited island, called Papiere; and Sangore, at about 36 miles south of Ligor, produces gold, tin, elephants teeth, &c. which are purchased by the Dutch factory. On the western coast there is an island called Jonaleme, which was formerly a kingdom, but at present is of no importance.

Martaban or Martavan in the bay of Bengal, was once a kingdom, but is now only a Siamese province. It produces corn, oranges, lemons, figs, pears, chestnuts, medicinal plants, oil of jessamy, gold, silver, steel, iron, lead, copper, rubies, lacque, benzoin, &c. The people make a kind of black porcelain, with which they trade to Malacca. This country is 300 miles long, 115 broad, is so fertile as to have annually three harvests, and is blessed with such a pure air that the inhabitants never are afflicted with the head-ach.

On the western coast of Siam are three clusters of islands, viz.

1. The Nicobar islands, about 90 leagues from the continent, and 120 north-west from Sumatra. The middle cluster are all well inhabited except one, and the land in general is very fertile; they are called Sombreiro; but the northern cluster named Carnicubars are not so populous. The inhabitants, who are of a tawny complexion, paint their faces with various colours, and the drefs of the priests is singularly whimsical: their cloaths fit them so close that they seem to be sewed up in them; they wear horns on their heads turning backwards, which, as well as their faces, are painted green, yellow, and black, behind them they have a long tail, and exactly resemble the figure which the painters of Europe have thought proper time immemorial to represent the devil by. About eight leagues to the south of Sombreiro are two well inhabited and fertile islands, called Ning and Gowry; the inhabitants of which will sell a hog for three feet of iron hoop, and a pig for one foot; they speak a broken kind of Portuguese, and are so fond of tobacco that they will give a fowl for a leaf of it. The southern cluster of the Nicobars are very mountainous, and the people much more savage than those of the middle and northern clusters. The inhabitants of these islands worship the moon, and venerate certain grottos in the rocks as temples. The men scrupulously confine themselves to one woman; and murder and theft are seldom heard of among them.

Nicobar, properly so called, which is the principal of these islands, and gives name to the rest, is near 100 miles north of Sumatra, about 10 leagues in length and four in breadth; is watered by many rivulets, and is very fertile. The inhabitants are robust, well made, and in their apparel resemble the people of the neighbouring continent: they employ themselves principally in fishing, and are some of the most expert swimmers in the universe; and Kemper affirms, that they can overtake a ship under full sail. The English ships bound to Sumatra usually touch at this island.

2. The Andaman islands lie in 13 deg. north lat. about 100 leagues north of Sumatra; they are well inhabited by a bold savage people.

SECT. II.

Natural History of Siam.

WITH regard to the soil of Siam, it may be said to consist of cultivated and uncultivated land; there is scarce a flint to be found in the whole country. The land seems to be formed by the mud descending from the mountains; to which mud, and the overflowings of the river, the soil owes its fertility: for in the higher places, and parts not reached by the inundation, all is dried and burnt up with the sun soon after the rains are over.

Siam had once the reputation of being very rich in mines: and indeed this appears from the great number of statues and other cast works that are here, many of which are of gold. Mr. Vincent, a French physician, discovered a mine of very good steel, and another of chrysol; also a mine of antimony, and another of emery; exclusive of a quarry of white marble, and a rich gold mine. The latter mine, however, he concealed from the natives. They have plenty of tin, which however is soft, but rendered hard, as well as white, by being mixed with kadmia, a mineral reduced easily to powder; and it is this white tin which is called tutenage. Mr. Vincent, during his stay at Siam, taught the inhabitants the art of separating and purifying metals.

Near the city of Louvo there is a mountain which produces loadstones; and there is another near Jonfalom on the Malacca coast: but these minerals, it is said, soon lose their virtue.

The most profitable trees in Siam are those which produce cotton, oil, and varnish: indeed the bamboo may be ranked with them, it growing to a prodigious size, and being of the utmost utility.

The forests afford timber for ship-building, house-building, &c. Here is a wood that will not cleave, and is called woodmary by the Europeans. Cinnamon-trees are natives of Siam, but not so good as those of Ceylon.

Iron wood grows here, and furnishes anchors: there is likewise a wood as light as fir, and of the same colour, but more fit for carving, as it always stands the chissel.

Rice is the chief grain used here; but wheat is sometimes sown upon the land that the inundation does not extend to: this is watered by small channels cut through the fields.

The Siamese rear pulse and roots in their gardens; and they have radishes, garlic, and potatoes; but no parsnips, carrots, onions, or turnips; nor have they any of the kind of herbs that we make use of in Europe.

Their flowers are tuberoses, jessamines, gilly flowers, tricolets, amaranthuses, &c. but these have not the fragrance of the European flowers. Oranges, lemons, citrons and pomegranates grow here, but no other fruit known in Europe. Here are mangostans, tamarinds, bananas, ananas, mangos, durians, &c.

The animals here are tygers, elephants, horses, oxen, buffaloes, sheep, and goats: there are some hares, but no rabbits. As to deer, there is a great plenty of them.

Peacocks, doves, pigeons, partridges, snipes, parrots, sparrows, and various other birds, are here in abundance. A bird, called the Noktho, is a very remarkable one: it is larger than an ostrich, and hath a bill near three feet in length.

The insects are white ants, marin-gowins or gnats, millepedes or palmer-worms, &c.

The Siamese, in tilling their land, employ both oxen and buffaloes; these they guide by a cord run through the grille of the noses of the animals, with a knot on each side, that it may not slip: it also passes through a hole or ring at the head of the machine used for ploughing. Nothing can be more simple than this plough: it consists of three pieces of wood; one is a long beam, which serves for the draught-tree or pole;

another is crooked, serving for the handle; the third is a strong short piece fastened underneath at the end of the handle; and it is this which bears the share. The whole is fixed together by leathern thongs.

SECT. III.

Of the Natives; their Persons, Dress, Manners, Customs, &c.

SIAM, considering its extent, is not very populous. The people are of small stature, and well proportioned; their complexions are tawny, and both sexes have broad faces; their eyes are small, their mouths large, their lips thick, their noses short, and their jaws hollow. Their hair is black, thick, and lank; each sex has it cut so short as to reach only to the top of their ears, which are particularly large. Both men and women dye their teeth black: the great men are said to paint their legs blue, but the ladies never use any paint at all.

People of distinction wear a piece of callico or silk, about two ells and a half long, which reaches to their knees. Great officers and placemen wear, besides, a muslin shirt, as a sort of vest: it has no neck-band, and is open before; the sleeves are not less than two feet in width; they are without plaits, and reach almost to the wrist. In winter some put over their shoulders a breadth of stuff, or painted linen, like a mantle or scarf, the ends of which are neatly wound about the arms. The king wears a vest of brocaded fatten under his shirt, with sleeves reaching to his wrist; but none must wear this dress except those who are honoured with it from the prince's own hands, who sometimes bestows on his generals a vest also of scarlet, to be worn only in war, or in some great hunting match; this reaches to the knees, and buttons before; it has wide sleeves, which are so short as not to reach even to the elbow. On those two occasions, the king and his retinue appear in red; his guards have muslin shirts given them, dyed of that colour. They wear likewise what they call a cap of ceremony, which is white, high, and pointed like a sugar-loaf. That worn by the prince is adorned with a coronet of precious stones; and those which his officers wear, have several golden or silver circles, by way of distinguishing their respective dignities.

The Mahometans have introduced the use of popushes or slippers, a kind of pointed shoe, without either quarter or heel; which they leave at the doors of the houses they enter, to avoid soiling the rooms. They approve of hats for travelling; though very few cover their heads from the sun's heat, except on rivers, where the refraction may be too violent.

The men wrap their callico or silken garment, (which the Portuguese call pagne) about their loins, putting one end back between their thighs, and tucking it in behind; so that it resembles breeches: the other end hangs before, and, as they have no pockets, serves to tie in a knot for holding their betel.

The women wrap their pagne about their waists, and let it fall half way down their legs; they cover their shoulders with other cloth, the ends of which hang down on each side, but they do not wear any sort of cap on their heads. The common people go almost naked, and have neither shoes nor slippers on their feet. The women load their fingers with rings, and wear bracelets on their wrists and ankles, as well as pendants in their ears.

The natives of Siam are remarkably clean and neat; they bathe three or four times a day, and perfume themselves: they wash their hair with water and sweet oil, and keep their black dyed teeth as clean as possible: they apply a pomatum to their lips to render them pale; for pale lips and black teeth are the marks of delicacy and beauty.

Such women as do not chuse to bathe have water poured upon them: they never go quite naked into a river, the idea of infamy in the sex being annexed to nakedness; nor can a greater affront be offered to a Siamese lady than the introducing any obscene conversation. The laws of Siam prohibit the importation of all Chinese figures or paintings tending to give offence to female modesty.

The people of this country have very clear ideas, and are extremely smart in conversation: they are by nature kind and complaisant, though rather haughty when too much submission is shewn them. They abhor both drunkenness and adultery, and a sincere affection subsists between men and their wives, who bring up their offspring to be as temperate, modest, obliging and affectionate as themselves. They are partial to the customs of their ancestors, and little admire the curiosities of foreign countries. They are timorous, careless, indolent, and have an aversion to the spilling of human blood.

Their usual food is rice and fish. The sea yields them very excellent fish of all kinds; they have fine lobsters, delicate little turtles, and small oysters, besides a variety of fish that the Europeans are unacquainted with. Here too are very fine river fish, particularly eels; they however prefer dry salt-fish, even though it stinks; and they eat mice, rats, locusts, and lizards.

A pound of rice, costing about a farthing, with a little salt-fish of no greater value, will serve a Siamese the whole day, their sauce is only a little water, mixed with spices or herbs. They have a favourite dish called *ta-la-chaun*, made of small fish reduced to a mash. They drink arrack, which is very cheap, or else common water. They use buffalo's milk, which yields a fine thick cream, and in greater plenty than the milk of our cows: they however make no cheese, and very little butter. They seldom eat flesh; when they do, they prefer the intellines. All animal food there is tough and dry; nor is any care bestowed on the poultry. As to wild fowl, these they never eat at all.

They drink tea when they receive company, but do not put sugar into their cups as we do; they put a bit of sugar-candy in to thicken their mouths, and sip the tea.

Servants and slaves, when in the presence of their superiors, must never stand, but kneel, or sit on their heels, with their heads inclined a little, and their hands raised to their foreheads. When inferior people pass their superiors in the street, they bow the body, join their hands, and raise them to their heads. In visits, an inferior prostrates himself, and never speaks till spoken to by the person to whom he makes the visit; for the person of superior rank must always speak first. The visited offers his place to the visitor, and presents him with fruit, betel, &c.

When a man of quality visits his inferior, he walks upright into the house, and the visited receives his visitor at the door, and attends him thereto when he departs. In short, the ceremonies observed at Siam are almost as numerous as those of China.

The right hand is looked upon as more honourable than the left; and that part of a room opposite the door, is always offered to a visitor. If there be much company, they are all seated according to their respective ranks in life.

These people, however, notwithstanding their general ceremonies, are in some instances rather indecent; for they belch without restraint, and with their fingers wipe off the sweat from their faces.

The head is in this country very peculiarly respected; for there cannot be a greater affront offered than to touch the head or the hair of any person. The respect to the head indeed is shewn by raising the hands to it in the ceremony of salutation. When a letter arrives from any person for whom the receiver has an esteem, he holds it up to his head, and perhaps lays it upon the crown.

The Siamese will never sleep under the feet of their inferiors. Their houses, though of but one story, rise gradually, and the innermost apartments, which are the highest, are deemed the most honourable.

The children of the Siamese have much docility and natural sweetness of disposition: they are instructed to express great modesty in every action, and all possible submission to their superiors. Parents are the more careful in the education of their children, as they are accountable for their offences.

The Siamese are thoroughly versed in all the principles of refined good-manners: they are so cautious of saying any thing that may give the least offence, that they will not even relate a circumstance founded on indisputable fact, if there be any part of it they judge disagree-

able even to the most insignificant in company. They never plume themselves on their own capacities, or affront others for their ignorance. Like the Chinese, they seldom speak in the first person; and behave with a general respect, courtesy, and politeness, which distinguish them as a well-bred people.

With respect to their method of travelling, they ride on the buffalo, the ox, and the elephant. Every person has an unlimited privilege to hunt and take a wild elephant, but he must not kill him: the female is employed in common uses, and the male is trained for war.

The Siamese also ride in chairs or sedans, which are square, with flat seats placed on biers, and are carried on mens shoulders. To some there are eight men, to others four. Some of these sedans have a back and arms, whilst others are only encompassed with a rail. Some are open at the top, and others have canopies. 'Tis not every person, however, who can ride in one of these sedans; 'tis an honour allowed only to great people of the court. The Europeans have the privilege of riding in palanquins, or canopied couches, carried on mens shoulders. Umbrellas are not allowed but to such natives as have the king's royal function for them.

The Siamese dispose of their daughters in marriage at a very early age. If the parents of the maiden approve of her lover, they consult an astrologer, after the match hath been proposed by women advanced in years. The fortune-teller is to inform them whether the match will be happy or not; that is, in fact, he is to know whether the man be opulent or not; for such is the despotism of the government, that individuals are obliged to hide their wealth. If the answer of the astrologer be favourable, the lover makes three formal visits to his mistress: on the third visit, the relations of the parties meet, when the young lady's portion is paid, and the marriage is looked upon as fully completed, without further ceremony, for the present. However, a few days afterwards the new-married couple are sprinkled with water appropriated for that purpose, and prayers are offered to heaven for their felicity. The wedding is then celebrated with feasting, dancing, and music, at the house of the bride's father.

Men have the liberty of marrying several wives; very few, however, except the higher classes, marry more than one; and this is done rather for grandeur and state, than from motives of either convenience or regard. Those who have many wives, stile one of them the chief or great wife, to whom the others are subordinate; for the latter, though legitimate, are considered as slaves, being purchased. Marriage is forbidden in the first degree of kindred; yet a man may marry the sister of his wife, after the death of the latter. The succession in families is in the children of the great wife, those of the other wives are, like their mothers, deemed slaves, and may be sold as such by the heir at law.

The wives of the ordinary class of men here work for their husbands, and maintain them during the whole time they are in the service of the prince, which is about six months in the year: they till the land, buy and sell goods, and do other necessary business.

Divorce is here tolerated, on condition that the husband restores to his wife the portion she brought him. In this case, the children are divided equally between the disuniting parties, who are at liberty to marry again as soon as they please. People of reflection and reputation, however, avoid these divorces if possible, well knowing that they do them no credit; and in general, as hath been already observed, the married people live together in great harmony and esteem. The husband, who has absolute authority in his family, can dispose of all his wives except the chief, and also of the children of such wives.

The women of Siam are said to be more tenacious and jealous of the honour of their husbands, than the latter are themselves. They have a strict regard to virtue, and cannot bear the smallest blemish on their reputations. At least, this is the character of the women in general.

The Siamese bury their dead in lacquered coffins: these they place upon a table, till every necessary preparation is made for the funeral. In the mean time they

they light up tapers, and burn perfumes. The talapoins or priests assemble, and sing stanzas for which they are well requited by the relations of the deceased. The corpse, in proper time, is taken into the fields to be burnt; the pile is made near some temple, in a square spot of ground fenced with bamboo. The body is decorated with gilt and stained paper, representative of birds, flowers, fruit, &c. which are for the use of the deceased in the other world, where such emblems are supposed to be animated and realized.

The procession of the corpse to the funeral pile is attended by various instruments of solemn music, and the mourners are all in white.

On their arrival at the place, the body is taken out of the coffin, and laid on the pile; then the priests sing, and a fire-work is soon played off. About noon (for 'tis in the morning the dead are thus carried) the pile is set fire to, and the ashes of the deceased are afterwards deposited in some part of the temple.

The poorer sort of people do not burn the bodies of their deceased relations, but either privately inter them, or else expose them on a scaffold in the open field, where they are devoured by birds of prey.

As to the religion of the Siamese, they are taught, by their talapoins, that the soul transmigrates; that all nature is animated, and informed by a rational soul; that heaven, earth, woods, hills, valleys, water, fire, and houses, are animated by some spirit; that the soul of man passes through many states, and is then confined to an human body, to be punished for its crimes: and, the better to establish the doctrine of the pre-existence of the soul, some of the talapoins persuade their disciples they even remember their several transigrations. The soul, they say, is formed of such subtle matter as not to be touched or seen, and yet after death retains the human shape: but though the soul be material, yet it is by no means perishable, but animates the body of some other creature: it is sensible of pain and pleasure, and will at length re-animate an human body. They believe too, there are certain places beyond the visible globe where they shall be rewarded for their good or bad actions: there are nine distinct regions of happiness and misery; the soul does not pass immediately from one state to another, but has new birth wherever it goes; therefore, they maintain, it stands in need of such things as it had been supplied with in this life: hence they burn various effects and emblematic figures with the dead; and implore the latter to do them no hurt in this life, as they have so amply provided for them.

They maintain that the soul resides in the blood, and therefore deem it improper to open a vein, or make any incision in the flesh, by which the blood might issue out.

As to the nine degrees of felicity and punishment, as we have just mentioned above, they believe that the nine first are above this world, and the other nine under our feet. The highest of the first nine is the place of most bliss, and the lowest of the second nine the place of most misery. But however great may be the felicity of the highest paradise, yet that felicity is not eternal, nor exempt from inquietudes; since it is a state in which a person is not only born, but also dies. The true paradise is of another kind. If, after several transigrations, a soul, by the good works done in each new life, arrives at such a degree of merit, that there is not, in any of the worlds, any mortal condition which is worthy of it, then they say, it enjoys the Hireupan; that is, it has disappeared, and will return no more to any world, but remain in a state of eternal impassibility and happiness. This is, properly, the Indian's heaven.

When a person, yet living, is supposed to have merited this everlasting state of happiness, they ascribe to him great strength both of intellects and body; they suppose he possesses universal knowledge; that he remembers every thing that occurred to him during his several transigrations, and knows what is to happen till the period of his departure from this life; that, before his exit, he shall have the power of working miracles; and that his death will be of a more noble kind than that of other people: he shall vanish, say they, like a spark lost in the air.

It is to the memory of these supposed perfect beings, that the Siamese erect and dedicate their temples: but the person who, they pretend, has surpassed the men that ever lived a life of righteousness, and to whom they therefore pay adoration, is Sommona Kodom. Kodom was the proper name of this man; and Sommona signifies a talapoin of the woods.

The books of the talapoins affirm, that the above holy person was the son of a prince of Ceylon, and that he not only exhausted his whole substance in continued acts of munificence, but even pulled out his own eyes, and then slaying his wife and children, gave them to the talapoins for . The same books also assert, that before the entrance of the above extraordinary character into the paradise of eternal bliss, he had acquired an amazing corporal strength, and could work miracles, being capable of extending his earthly frame to whatever dimensions he thought proper, and then of diminishing it even to so small a point, as to become totally invisible.

But whatever power they ascribe to this great Sommona Kodom, they do not maintain that his power extends over other nations; nor do they consider him as the institutor of their religion, but only the restorer of it, after mankind had relinquished such wise precepts as had been originally laid down for them.

The Siamese allow of the practice of all religions, and never wish to convert any person: they do not, like the Europeans, extol faith as a grand virtue; they believe, because they know not how to doubt; much less are they persuaded that there is a mode of worship which ought to be the established religion of all nations. The priests do not hold, that a soul shall be punished for denying their traditions; for they themselves have a respect for every religion, even if they cannot immediately comprehend it. They do not imagine their religion to have proceeded from heaven, or that it is in every point consistent with reason: they frankly acknowledge that there are inconsistencies in their sacred books; yet, upon the whole, insist that their religion is founded in truth and virtue: they hold it to have been born with man, and penned by some extraordinary human judgment that never committed any kind of sin, though uninspired.

We shall close this section with observing, that the principles of the Siamese morals are reduced to five negative precepts.

The first precept, "Kill nothing," is extended to vegetables and feeds, as well as animals; because they believe the seed contains the plant, or is only the plant itself under a cover. The person, therefore, who keeps the precept inviolate, can live solely upon fruit, which they consider only as part of a thing that has life, and which thing does not suffer by having its fruit plucked from it: but in eating the fruit, the kernel must not be devoured, as being a seed. The precept even forbids the destruction of any thing in nature; because, as hath been already remarked, they suppose every thing to be animated with a rational spirit. Thus they believe, that to break a branch of a tree, is like breaking the arm of an innocent man, and offends the soul of the tree; but when once the soul has been dislodged from any body, they think there is no crime in feeding upon the latter. They have methods of evading many of the rules ordained by their religion.

The second precept, "Steal nothing," is most strictly and religiously observed; as is the third generally, "Commit no impurity." The fourth, "Lye not, nor slander," is enforced with great warmth and zeal by the talapoins, and observed, as much as the frailty of the human heart will admit, by their disciples. The fifth and last precept, "Drink no intoxicating liquors," prohibits not only the drinking strong liquors to excess, but even the drinking them at all.

S E C T. IV.

Particular Account of the Talapoins and Talapoinesses.

THERE are talapoins of the woods, and those of the towns; but as any person who is learned may become a talapoin, he who inclines to enter into the spiritual

spiritual brotherhood, first applies properly for admission, and then assumes the distinguishing habit, which is a garment of various colours; but he has no shirt or vest, and goes bareheaded and barefooted. The habit consists of four pieces of cloth; the one is the angia, a kind of shoullder-belt, five or six inches broad; they wear it on the left shoullder, and button it with a single button on the right hip. Over this belt they have another, called the passivon, reaching to the ground both behind and before, and leaving the two arms, with all the right shoullder free. Over this is the papat, which reaches low behind, as well as to the middle before, and is generally of a red colour. They gird the whole with a piece of yellow cloth called rappakod, that completes the four pieces of which their habit consists.

The talapoins have strange conceptions of the nature of sin; for, supposing their ideas in this respect to be ever so comprehensive and just, they, however, violate, for convenience, the strictest rules. For instance, though they themselves refrain from the commission of actions repugnant to the principles of their religion, yet they readily connive at whatever the laity do. Thus, rice being a food, they will not boil it, as boiling it is killing it; but they will eat it when boiled, nor be displeased with those who commit the sin. Whatever sins the laity commit, these fathers expiate by their good works.

A talapoin is never suffered to intermeddle in any state affairs; nor must he, if avaritiously inclined, in the least shew it: he must never adorn his apparel, or betray any particular fondness for women.

The spirit of the institution of this holy order is to lead a life of devotion and penitence for the sins of other people. They subsist entirely upon alms, and are constrained, so long as they continue to follow their profession, to live single, on pain of being burnt; but not burnt to death; or the authors of the Universal History are in a great mistake when they say, "It is one of the privileges of the talapoins, that they cannot be put to death."

The talapoins are ignorant of the founder of their order, though the people think them and their doctrine as ancient as the world itself.

These fathers educate children, and at every new and full moon expound the principles of their religion in the temples. When the rivers swell, they preach constantly every day, both morning and afternoon, till the inundation subsides. They relieve each other, and sit cross-legged, in a high state-chair; and when each concludes his sermon, the people give him alms: so that those who are industrious in preaching, soon become rich.

"This time of the inundation, says an author, may be called the Lent of the talapoins: their fasting is to eat nothing from noon; they only chew betel."

When the rice harvest is got in, the talapoins of the towns go every night, for three weeks successively, to watch in the fields, under little huts, and in the day return and sleep in their cells, near the temples. In the centre of their temporary habitations stands the hut of a superior. They make no fires to guard themselves against the wild beasts, their sanctity being deemed alone sufficient to protect them. But it must be considered, that in this season the beasts meet with a good deal of forage, and are not so sharply on the hunt as at other times: besides, the priests generally take care to have their huts secured by some fence. The people, however, attribute their preservation entirely to the purity and holiness of their manners. They think that a tyger, when coming up to a talapoin, will only lick his hands and feet, and then leave him.

At dawn of day, the talapoins rise and wash themselves. They then attend a superior to the temple, and spend two hours in prayer, and singing hymns, which are engraved in the Bali tongue upon long and broad leaves. Both the talapoins and the people prostrate themselves three times upon entering, as well as leaving the temple: the object of their homage is a great idol in the building.

As soon as service is over, the priests go and beg alms in the street: their begging is of a peculiar nature;

they have an iron bowl in a piece of linen, which they throw across their shoulders by means of a cord, and then fix themselves at some door, without opening their lips: the people, however, generally give them something, and, with whatever they get, they repair to the temple, to make an offering of it to the idol.

Having breakfasted, they apply themselves to study, and the instruction of their pupils: in the afternoon they sleep; and towards night, after spending two hours in prayer and singing, they refresh themselves with some fruit, and retire to their natural rest.

At every new and full moon the people wash the talapoins, after these priests have shaved their faces, heads, and eye-brows; and when a superior of a convent dies, another is elected in his room by the brotherhood. The name of the superior is Chaw-Vat, or a lord of the convent. The highest, however, in office, is the Sankrat, who ordains the talapoins, as our bishops do their priests. But though the sankrats alone can constitute a talapoin, yet the jurisdiction of the former extends no farther than just over the people of their own particular convent.

The clergy have great privileges granted them; among others, they are exempt from services under the king, who therefore, lest they become too numerous, causes them to be examined, at particular times, as to their knowledge of the Bali language, and of the holy writings. If they are not deemed sufficiently learned, he reduces them to a secular state. Some thousands were reduced in the year 1687.

The talapoineses are nuns who live with the talapoins in the same convents; which convents are a number of single houses standing upon bamboo pillars at a small distance from each other. Of their temples we shall give an account, when we describe the city of Siam.

Though the talapoineses reside with the men in the same convents, yet, as they are never admitted till they are old, there is no apprehension of a criminal connexion. Every person who goes to a convent, goes there entirely by choice, and has liberty to leave it whenever he or she pleases.

SECT. V.

Of the Laws of Siam, and Punishments inflicted for Offences.

THE laws of Siam are contained in three large volumes, enjoining an unlimited obedience from children to their parents, and subjecting the former entirely to the jurisdiction of the latter.

The governors of provinces have the sole command in both civil and military concerns.

With regard to punishments for offences, some are equitable and rational, others ridiculous and barbarous.

The usual punishment for robbery is the being obliged to pay double the value of the effects stolen, or the suffering corporal punishment, as the delinquent may perhaps have no effects to compensate with. Whoever here wrongfully keeps possession of another man's estate, is considered in the light of a thief or robber; so that, when ejected by law, he is not only obliged to give up the inheritance to its right owner, but also to pay, exclusively, the full value of such estate; half of which goes to the party injured, and the other half to the judge who tries the cause.

Persons guilty of rebellion are ripped up alive; and those convicted of treason or murder are trampled to death by elephants. If a great man of the court be detected in embezzling any of the royal treasure, they pour melted lead or other metal down his throat. Omissions, in a general execution of orders, are punished by cutting the head with a sword, called pricking the head, as if to punish the memory. The bastinado is sometimes exercised in a very rigorous manner. Almost the smallest appearance of guilt confirms the crime, and to be accused is nearly enough to render a man culpable. When a person, however, designs to prosecute another, he is obliged to draw up a petition, in which he states his complaint, and presents

it to a Nai, or chief, who conveys it to the governor of the province in which the offence was committed. When every thing is prepared for trial, the parties have summonses sent them to make their personal appearance in court; where, merely by way of form, they are advised to compromise matters. At length, however, the governor fixes upon a day for all parties to attend again; and on this day, if sufficient testimonies are not produced, as to matter of fact, and admissible defences made, both plaintiff and defendant are constrained to walk upon red-hot coals, and he who escapes unhurt is looked upon to be innocent. In some cases the parties are obliged to put their hands into boiling oil; and in both these ordeal trials, by some dexterous management, one or the other of the parties is said to remain unhurt. Loubiere relates, that a Frenchman, from whom a Siamese had stolen some tin, not having sufficient proof to convict the offender, was advised to put his hand into a pot of boiling oil, with this assurance, that if he was just in his accusation the oil could not possibly hurt him. The Frenchman agreed to the trial, but almost consumed his hand, whilst the Siamese, who had readily submitted to the same proof, drew his hand out of the oil unhurt.

There is also a proof in this country, by placing the parties under water, and he who can remain there longest is supposed to be innocent. Sometimes emetic pills are administered, and he who can keep them on his stomach without vomiting, is looked upon as guiltless. "These trials," says an author, are made in the presence of the king and magistrates; and it sometimes happens that the former causes both plaintiff and defendant to be thrown to tigers, and if either of the persons has the good fortune to escape, he is deemed innocent."

We should, from the nature and extreme absurdity of these trials (which are practised in other parts of the world as well as Siam,) suppose them to have been long since abolished, had we not the concurrent affirmations of respectable authors to the contrary. We will flatter ourselves with the hopes, however, that ignorance and insatiation do not cause so frequent an exercise of them as in earlier ages. The committing a couple of men to the fury of a tyger, is the very excess of equal ignorance and cruelty; for if both be devoured, what proof of innocence is there in either?

The provinces frequently appeal from one to another; and the president of the tribunal in the city of Siam, can reverse a judgment given in any of them, except the province appeals to the king; so that where the parties are opulent, a suit is sometimes very tedious and expensive; and when the poorer sort of people have formidable adversaries to cope with, their innocence is but a slender shield to them. Suits ought always to end in three days, but some last as many years. They have no attorneys; the parties either act, and speak for themselves, or depute some relation; and what each says is minuted down by the governor's clerks.

The functions of governor and judge in the capital are divided into two offices; and the subordinate offices are given to the principal officers of state, who compose a tribunal in the palace royal, and to whom all appeals are made. Indeed when the king removes from thence, the president dispenses justice in a tower out of the royal inclosure; and to him alone belongs the determinate voice. Judgment is never executed without a special commission from the king; and to prevent oppression being exercised by the governors of provinces, officers are appointed to repeat to the king every thing that passes, in causes of particular consequence in the courts of judicature: the salutary intention of this constitutional measure, however, is generally defeated by a connivance between the officers.

As we have, in the course of this section, spoken of the punishment inflicted for treason, we shall add a quotation from an author who treats of the trial of capt. Hamilton for that offence at Siam, in the year 1719.

"In 1719, Captain Hamilton being at Siam, and conversing with Oya Sennarat, a man in power, about some alteration in the English treaty of commerce, happened to say, that 'the king had been imposed on.'"

16

Now it seems that the merely saying that the king of Siam was imposed on, was deemed to be treason. The captain was therefore in a few days taken into custody, and brought to account of justice, where Oya Sennarat appeared against him, and brought a evidence one Collifon, who affirmed he had heard the captain utter the words in the Indian language, but Collifon being asked by the judge if he understood that language, and the former acknowledging he did not, the captain was acquitted. Had he been convicted, he would have been immediately executed on the spot, the elephant being ready."

Lesser crimes are usually punished in a very suitable manner; for lying, the mouth is sewed up; a cheat is obliged to walk about several days with a small wooden pillory about his neck; and one who is guilty of assaulting another with a malicious intent, is sentenced to be quickset, that is, set in the ground up to the shoulders, and his head severely buffeted about. In these rational punishments, strict equity seems to deal her judgments with impartiality.

"Of all the virtues, equity is best,
"Valour without it is a common pest;
"Pirates and thieves too oft with courage grac'd,
"Shew us how ill that virtue may be plac'd:
"Tis our complexion makes us chaste or brave,
"Justice from reason, and from heaven we have;
"All other virtues dwell but in the blood,
"That in the soul, and gives the name of good."

Yet it cannot be denied, that in Siam, as well as other places, favour may be bought; equity is frequently sacrificed to a bribe, and the smiles of the law are disposed of to the best bidder.

"Laws bear the name, but money has the power,
"The cause is bad whenever the client's poor;
"Those strict-liv'd men, that seem above our world,
"Are oft too modest to resist our gold,
"So judgment, like our other wares, is sold;
"And the grave knight that nods upon the laws,
"Wak'd by a fee—Hems! and approves the cause."

They have, however, one excellent custom here, which is, that none are permitted to upbraid a delinquent with his offence, after he has suffered the sentence of the law; nay, the crime is so little thought of after the punishment has been inflicted, that the person is caressed as much as ever; and an offender who is one day in the utmost disgrace, may the next be advanced to the highest dignity—For by his suffering

"The scurf is worn away of each committed crime,
"No speck is left of his habitual stains,
"But the pure ether of the soul remains."

S E C T. VI.

Of their Languages and Learning.

THE natives of Siam have two languages, viz. the Siamese and the Bali: the latter is their learned and sacred language. The former has thirty-seven, the Bali thirty-three letters, all consonants. The Siamese resembles the Chinese in some respects: it has neither inflections of nouns or verbs, these being supplied by four or five particles, placed either before or after the verb.

The favourite study of the people of Siam is arithmetic, in which they use ten characters as we do, and are very ready in casting up accounts.

They have no ideas of the graces of oratory; nor have they the art of printing among them: books are engraved with an iron pencil.

They have very slender conceptions of philosophy; and as to the laws of their country, these they do not study, unless placed in some office where a knowledge of them is essentially requisite.

As to astronomy, they know nothing of the system of the
Y y the

the world : like the Chinese, they think that eclipses are occasioned by a mighty dragon ready to destroy both the sun and moon, and therefore make a great noise with brass pans, &c. to frighten away the monster. They believe the earth to be square, on whose extremities the arch of the firmament rests.

Their calendar has been regulated twice by able European astronomers, who have taken two epochs, distinguished for some rare conjunction of the planets: the first refers to the year 545 before Christ; the second to the 638th after Christ. Their year they divide into three seasons, beginning it at the first moon of November or December: they have no clocks, but judge of the time by the sun: they have four watches for the night; and in a court of the royal palace, there is an hollow vessel with a small hole therein; and this, set upon water, gradually lets it in, till it sinks just as the hour expires; and then particular persons about the palace strike loudly upon copper basons, to proclaim the expiration of the hour.

As to astrology, no affairs of consequence are ever undertaken without a previous consultation with some prophetic and learned sage in that sublime science.

They scarce know any thing of anatomy or medicine: indeed there are some physicians among them; but these must act with great caution: for if they prescribe for the king or royal family, and do not give relief, they are severely cudgelled. They cure most diseases by sudorifics: their whole practice of physic consists in using certain receipts handed down from their ancestors. The physicians sometimes prescribe purgatives, but very seldom emetics. Their chief diseases are fluxes and dysenteries; and the small-pox often makes great havoc amongst them. When a patient is past all cure, they say he is enchanted.

An author, speaking of these people, says, "They know nothing of chymistry, though they passionately affect it; and some boast of profound secrets. A king of Siam once spent a prodigious sum in search of the philosopher's stone."

As to music, they use a kind of violin, with three strings, and a shrill hautboy; also little drums and copper basons; but neither play nor sing by any kind of notes. They have also a trumpet that makes a very harsh noise.

When the king goes out, and the whole royal band attend him, the sounds have an extraordinary effect upon an European ear.

S E C T. VII.

Of the King: general Relation of this despotic Monarch, including an Account of his Palace, Guards, and Elephants. Of the Ladies who attend on his Majesty: of the Queen: of the King's annual Processions; of his Army, Navy, and royal Revenues.

THE king of Siam, who claims a kindred with all the kings, is a most despotic prince, and is almost adored by his subjects: even his ministers, when in council, never must presume to speak to him but upon their knees. His palace is a most splendid edifice, situated on an eminence, and may be compared to a city, so extensive is it, and so grand are its several pyramids, towers, &c. This superb pile, which stands on the north side of the city of Siam, and is built with brick, is surrounded by three inclosures, and spacious courts between each wall. The apartments of the king and queen are in the innermost court, which includes several elegant gardens. The people always prostrate themselves on entering or quitting this inner court.

An intelligent author, speaking of the royal palace, says, "It is a mile and a half in circumference, and divided by courts: in the two first are lodged the officers of the king's household; and in the others are still to be seen some old apartments of the ancient Siamese monarchs, esteemed as sacred places, with lovely rows of trees before them. There are also some antique temples, grand and ornamental. The king's apartment, which is in the innermost court, was but newly built when the French ambassadors were at Siam: the gold, which glitters in a thousand places, distinguishes it from the other

buildings: nor can any thing be better done than the carved work with which it is adorned on every side. The queen's, which is very magnificent, adjoins to the king's."

The palace gates are always kept shut; and at each gate stands a porter, who, on any person's wanting admission, informs an officer of it; and no one can ever be admitted that has drank any spirituous liquor; on which account the officer always smells the breath of those who enter. There are always six hundred soldiers in and about the palace; but these are never armed, except on particular occasions. They are the king's executioners as well as guards, and a party of them row his balon when he goes on the water.

The king has also two bodies of horse-guards, who are natives of Laos and Meen; and a third composed partly of the natives of Indostan and Chinese Tartary. These horse-guards always attend his majesty when he goes abroad; but it must be observed, they are never suffered to be within the palace gates.

In the first inclosure of the royal palace are the stables of the best elephants and horses: the former are named by the king, and attended with great care: that which has the most honourable name, is treated with the greater respect. They have always their rich trappings on when taken out of the stables; and the people have an opinion that these sagacious animals possess the souls that formerly lived in the bodies of great and famous men. The king will never ride upon a white elephant, from a notion that it is animated with the soul of some prince. His majesty is styled, king of the white elephant; a title, however, which the king of Pegu disputes with him.

In the innermost court of the palace, where, as we have observed, the apartments of the king and queen are, there are handsome halls, besides a grand hall of audience; at two corners of the latter there are two noble doors, ascended by a flight of steps: the window has three umbrellas, one before it with nine rounds, and two on each side with seven; the umbrella being, in this country, a mark of state, as the canopy is in Europe. In this hall the officers receive their orders, by the intervention of forty pages divided into four bands, who prostrate themselves, half on the right hand, and half on the left, while the monarch shews himself at a window looking into the hall.

None but ladies are allowed to attend his Siamese majesty in his bedchamber, who dress and undress him, except indeed putting on his night-cap, which he does himself, as nobody must touch his head. His provisions are dressed by females also, who wait on him at table, after some little ceremony between them and the eunuchs with regard to the bringing in the dishes.

But though the king is thus attended by women, he has gentlemen of the wardrobe; the most distinguished of whom has the honour of having in his care his majesty's golden cup.

The queen has her elephants and balons, and is attended with great pomp wherever she goes: she, however, is not seen by any body except her female attendants and eunuchs; for she is always in a chair inclosed with curtains.

The eldest son of the queen does not always succeed to the crown, but generally the eldest son of the king by the first concubine that brings him a child. Daughters never inherit the throne.

When the king goes abroad, he either rides upon an elephant most richly caparisoned, or is carried in a grand chair. Once a year he passes through the city, with a numerous train of elephants, and bands of music. The populace, during the procession, fall prostrate at the approach of his majesty, and rise, after he has passed them, to gaze at him.

Once a year also he shews himself on the river in a grand balon covered with a rich canopy: several thousand other balons are seen upon the water at the same time, forming a most elegant sight. He is rowed to a temple on the opposite shore, where the priests pray for him, and present him with a couple of yards of cotton cloth, spun and woven on that day. At sun-set he leaves the temple, and is rowed back to the palace.

An author, speaking of the king of Siam's water procession,

cession, says, "His reason for honouring the river and his people at this time, is to forbid the water rising above such an height, or to continue increasing above such a number of days: however, it often disobeys his majesty's commands."

No officer or other person must ever presume to approach the king in his royal apartment without a previous order given him: this is a law made for the prince's safety.

The great officers must never visit each other privately; the visit must be on some public occasion; and they must always speak loud, so as to be heard; for if they speak in a low tone of voice, it is suspected they are conspiring against the state; and every person who hears any thing said that is not favourable to government, is under a necessity of commencing informer; for 'tis death to conceal it; and there are always a number of spies ready on the spot, to make general observations of the company.

Though it is high treason to say the king can be deceived, yet he is often and easily deceived; for all informers are dishonest, and the Indian princes love to be flattered: the courtiers conceal their real sentiments from their prince, and the prince conceals his own from them: they must never presume to point out any error the sovereign has committed, or be so bold as to tell him that it is impossible to execute what he commands; they therefore implicitly obey him, and if they miscarry, excuse the miscarriage afterwards in the gentlest terms.

The common people live in much greater security and happiness than the nobility and officers of the crown; for honours here never lead to happiness, but to anxiety, dread, and a perpetual disturbance of mind. "The common people, says a respectable author, enjoy pleasures which their superiors are strangers to; nor indeed are they so liable to be oppressed as the subjects of some other countries, free access to the throne being always had when complaints are to be made."

That no individual (a talapoin excepted) may avoid serving his prince six months in the year, every man is enrolled; and companies are formed and commanded by a Nai or general officer.

When the Siamese go to war, their order of encampment and battle is thus: the army arranges itself in three lines, and each line is composed of three great square battalions, the king being in the centre one.

The nine battalions thus formed, each has sixteen male elephants in the rear, accompanied by two females, besides others of those animals for carrying baggage, &c. The Siamese rely much on their elephants, though the latter cannot be managed with a bit and bridle like a horse; in short, when they are wounded, they often turn back on their masters, and throw the whole army into disorder.

The battle always commences with a discharge of artillery, with which they have been supplied by the Portuguese; and then they exercise their arrows, but never come to a close engagement.

We shall here beg leave to quote a few words from an author who treats on this subject, and who seems to have taken great pains to obtain a thorough knowledge of the Siamese. "As their religion, says he, inspires them with an horror of blood, they, to avoid killing, do not shoot directly at one another, but higher; yet so as that the shot may fall among the enemy, and oblige them to retreat; which one party fails not long to do, when they perceive it to rain darts and bullets. Indeed, when they find themselves pursued, they shoot lower, in order to stop their adversaries; who, if slain, are then thought to be guilty of their own death, by approaching too near: for the order which the king gives his troops is, 'Kill not, unless ye are forced to it by necessity.' As for sieges, they are wholly incapable of carrying them on."

The same author says, "The armies of Siam, and indeed all the neighbouring countries who hold the metempsychosis, busy themselves only in making slaves; and the usual way among them of waging war, is to invade each others dominions in different parts at the same time, and to carry off whole villages into captivity."

As to the king of Siam's navy, his majesty is not master of above half a dozen capital ships, the crews of

which are foreigners; he has, however, exclusive of these, about sixty galleys of war: but they are small, with only one man to an oar, who is obliged to row standing, the oar being so short, for lightness sake, that if not held perpendicularly, it would not touch the water. The king, in his naval expeditions, only makes reprisals on such of his neighbours as injure him in his commerce. His royal baloons, or pleasure barges, consist of about an hundred and fifty, and are very magnificent.

As to the revenues of the king, they arise from cultivated lands, exports and imports, vessels, gardens, fruits, fines, confiscations, &c. &c. His treasury is immensely rich.

S E C T. VIII.

Of the Nobility, great Officers of State, and Ambassadors.

NOBILITY in Siam is not constituted by birth, but by the prince's favour, or by opulence. He sometimes ennobles people of the very meanest extraction, provided they have any particular services to recommend them. To these he gives, as a mark of distinction, either a golden or silver bouffette to hold their betel.

There are five degrees of nobility, viz. the Oyas, who possess the highest places, and whose golden bouffette or box is much better wrought than those of the inferior nobility.

The Okpras form the second degree of nobility, and are considerably more numerous than the Oyas. From the Okpras, the king's ambassadors extraordinary are chosen.

The third degree of nobility are the Oklouans: these have only a silver bouffette, chased with festoons and branches.

The fourth and fifth orders are the Okkowns and Okmunes; out of whom the king chuses his judges, governors, &c. and whose bouffette is quite unornamented.

The authors of the Modern Universal History say, "The king of Siam has many lords, who are peculiarly attached to his royal person: these always live within the palace. Others there are who are employed without, to govern affairs, and preserve good order among the people. The rank of each nobleman is distinguished, when he appears abroad, by the richness of his sword as well as other marks of honour. The ladies are also distinguished in proportion to their respective ranks."

The abbe de Choisy says, "There are eight great officers of state in Siam, viz. the Maha Ommarat, who is the next to the king in authority, and sits in his presence; the Chakri, who regulates the affairs of war and justice; the Aahoon, who is generalissimo both by land and sea; the Okya Vang, who superintends the affairs of the palace; the Okya Pracklang, who has the care of foreign affairs and the royal magazines; the Okya Pollatep, who has the charge of the king's revenues; the Okya Jombarat, who is head judge of all criminal matters; and the Okya Pakdi, grand treasurer. These prime officers, with the king's approbation, dispose of all other posts in the realm, and are responsible for any errors committed in them."

All the officers of government, residing in the capital, must daily attend in some part of the palace, except they have leave of absence, on pain of being severely whipped with split rattans, which cut deep in the flesh.

Ambassadors in Siam are considered in a very inferior light, being deemed only the special messengers of the princes whom they represent; which office is far from being accounted so respectable as in Europe, and other parts. Those who come from the neighbouring sovereigns, that are dependant on, or connected with the emperor of Siam, are obliged to prostrate themselves before him, and advance towards him creeping upon their hands and knees. Ambassadors from independent Asiatic monarchs are treated with some trifling degree of greater respect. But the European ambassadors are exempted from many of the ceremonials which the others are obliged to observe. They must, however, not attempt to open their lips till the emperor has first spoken; and when they do speak, to be exceeding laconic, a long harangue being deemed an egregious insult.

SECT. IX.

The City of Siam, Houses, Furniture, Trade, Six Months Service of the People, which they are obliged to perform annually for the Emperor.

THE city of Siam, the metropolis of the Siamese empire, is in 14 deg. north lat. and 101 deg. 5 min. long. its circumference is 10 miles; and many canals, whose sources are in the river Menan, pass through it; as they are navigable, the convenience to the inhabitants is very great. The walls are thick and high, built of stone and bricks, of both which materials some of the bridges are erected, though most are built of wood. The only public structures worth notice are the palaces already described, and the temples, which are so gilded on the outside, that the effulgence of the sun beams reflected from them, dazzle the eyes of the beholders. One of the latter, which is a square building, contains 100 idols, placed in niches 4 feet from the ground. They are as big as life, sit cross legged, and are all gilt. The figures of dreadful dragons are placed at the gates of the temples, and above 50,000 talapouts reside in and near the city. In the vicinity of Siam, the French have a church, a bishop, and a college for converts; the Portuguese have a chapel; and in the city itself are many Chinese temples. About a mile below the town the Dutch have a factory, and the suburbs on both sides the river are in general inhabited by strangers. The streets are narrow, but regular; the houses are built on raised ground, by reason of the frequent inundations; and the inhabitants in the rainy seasons go about their business in boats. All the houses are built of timber or cane, except one street, which contains 200 brick dwellings of only one story. The markets here are well stocked with cattle, wild and tame; rice, fruits, pulse, roots, &c. And the trade consists of the admirable gems of Pegu, silver bullion, manufactured iron, broad flannel cloth, looking glasses, &c. China wares are cheaper than at Bantam. The river will contain vessels of 400 tons burthen, and divides the city into eight parts.

The walls and floors of the houses are of cane materials, covered with mats; the windows are holes in the sides, which are always open, the stair-cases are ladders, the chimnies are apertures in the roof, and their fire place is only a basket of earth in the middle of the room. The cattle are kept in the houses for fear of inundations. The principal pieces of furniture are, a small couch covered with a mat, which serves for a seat by day, and a bed by night; but when they retire to rest, a mattress stuffed with cotton is added in lieu of a bed; many have likewise a sheet, a quilt, and a pillow; the rest of the furniture consists of lacquered tables, cabinets with drawers, copper and earthen vessels, China ware, &c. Besides which, every family has a chest of working tools.

The emperor of Siam claims six months labour from all his male subjects; if he is at war, they are enrolled as soldiers; but if it is a time of peace, they are employed in agriculture, mining, building, fishing, rowing, &c. They are divided into bands, each of which is under the direction of a proper officer, who frequently supplies their necessities by lending them money, paying their creditors, &c. but this often turns out to his own

advantage, as all who are insolvent become his slaves. Those who row the emperor's balons, barges, and gondolas, are branded in the wrists to be peculiarly distinguished; they are better dressed, and better fed than such as belong to the other bands; but at the same time, they are harder worked, and oftener corrected.

Thus all th' advantage which from dress they gain,
Is lost in punishment, and sunk in pain;
While the still greater slav'ry, renders crude
The finest sauces to the daintiest food.

SECT. X.

History of Siam.

NOTHING that can be deemed authentic of the history of Siam is known previous to the year 1500, nor do the Siamese themselves pretend to be possessed of any ancient records.

The Portuguese affirm, that in 1511, when they took the city of Malacca, that it was governed by an Arabian prince, named Mahomet, who was totally independent of the Siamese sovereign. From the above is nothing remarkable happened till 1640, when the Dutch took Malacca, which they still retain, from the Portuguese.

In 1688, the general of the Siamese troops, being popular among the soldiers, and having the army at his devotion, took occasion to quarrel with his sovereign in order to depose him. This he effected, and deprived his master of life, in the manner of a royal criminal; that is, by pounding him to death in a large iron mortar with a wooden pestle. The secretary of state was kept confined three years with the Siamese pillory about his neck, and was never, during that time, permitted to quit his dungeon, but when he was taken out to be severely lashed, in order to make him accuse some of the principal people of having accumulated riches by clandestine means, that the usurper might have some pretext to plunder them. The usurper, however, enjoyed but little satisfaction from reigning; as he lived the martyr of guilt and slave of suspicion, his crimes encreased his fears, and his fears multiplied his crimes; for, while his conscience tormented him with the idea of the murders he had done, the dread of being himself murdered prompted him to commit more, and induced him to fancy that his security could only be founded on the blood of those he suspected.

"The man who rises on his country's ruin,
Lives in a crowd of foes, himself the chief;
In vain his pow'r, in vain his pomp and pleasures,
His guilty thoughts, those tyrants of the soul,
Seal in unseen, and stab him in his triumph.
Wretched distracting state! when ev'ry object
Strikes him with horror, ev'ry thought with fear."

The above revolution was the ruin of the factory, which the French had just before erected at Bancock.

In 1717, the Siamese monarch invaded Cambodia with 50,000 men by land, and 20,000 by sea, but proved unsuccessful in his expedition, which is the most recent circumstance that we are acquainted with, relative to this country, that can be depended on as authentic.

CHAP. XIV.

OF TONQUIN.

SECT. I.

In Boundaries, Extent, and Situation; its Climate, Soil, and Produce; Division of the Country, with the Manners, and Customs of the Inhabitants.

THE kingdom of Tonquin is bounded on the east and north by the empire of China; on the west by the two small kingdoms of Laos and Bowes, bordering on Siam; and on the south and south-east by Cochin-China. It is about 300 miles in length, and 400 miles in the broadest part; and is divided into eight provinces, viz. east, west, north, and south provinces, Tenay, Tenhoa, Ngeam, and the province of Cachao. It lies on the side of a gulph, 30 leagues across in the widest part, at the extremity of which are several small islands.

As to the climate of Tonquin, this country being situated under the tropic, the weather is extremely variable; however, their two chief distinctions with respect to this are those of the dry and rainy seasons; the former of which is the more agreeable, and continues from September to March; during which time the north wind blows without intermission, and the air is healthy, except in January and February, when the weather is frequently very severe. The rainy season begins in April, and ends in August, the south wind blowing all the time; the three first months of this season are very unhealthy. During the months of June, July, and August the heat is very intense; nevertheless, the country, at this time, has a most pleasing and beautiful appearance; the trees are loaded with fruit, and the plains covered with a rich harvest. However, as the land mostly lies low, particularly near the sea, it is subject to frequent inundations; and when these are greater than usual, the natives are considerable sufferers.

Added to a good soil, there are great numbers of canals; and as rice is the chief food of the natives, so the husbandry of it is the peasant's whole employ, and the land generally rewards his toil with two crops yearly.

The oranges of Tonquin are said to excel all others in the east for richness of flavour; and here are guavas, bananas, arekas, papays, &c. as well as various kinds of flowers, among which are very beautiful lilies and Jessamins, though the Tonquinese discover not much taste for this elegant entertainment of nature. Indeed the ladies here have a great esteem for one particular flower, which retains a very fragrant scent even for 15 days after it is gathered: with this flower they decorate their persons, when in their best and gayest apparel.

Tonquin affords no mines of gold or silver; there are, however, iron and lead mines in abundance. Silk-worms are also here in such plenty, that silk is almost as cheap as cotton. Sugar-canes likewise thrive well in this country; and they have a sort of tea which they call Chia-bang, the leaves of which they boil; as also another kind called chia-way, the leaf of which is not fit for any use, but the flower, when dried before the fire, makes a very agreeable liquor by infusion, as the other does by decoction.

Tonquin, as before observed, is divided into eight provinces; among which is the metropolis Cachao, the residence of the chova or king; but this city has no remarkable buildings except the royal palace, which stands in the centre of it. This is a spacious edifice, encompassed by a wall, within the precinct of which are several buildings two stories high, with gates and fronts in a superb taste. The chova's apartments, and those

of his concubines, are grandly decorated with gilding and varnish-work; and behind the palace are large handsome gardens.

The houses of private people in this city are of wood and earth, and chiefly of one story; those of foreign merchants only are built of brick.

There are to be seen in Cachao the remains of an antique palace of marble, which, according to the dubious authority of their histories, was erected by Li-bal-vie, the second elected sovereign of the kingdom. From the ruins of this building one would judge it to have been one of the grandest and most magnificent structures in the east.

The Tonquinese are of a middle size, and pretty well proportioned; they are of a tawny complexion bordering upon yellow; their hair is black, thick, and long, falling in waves upon their shoulders. Their teeth are as white as snow, till they colour them black, using for this purpose a corrosive composition. They much resemble the Chinese, and, like them, have great natural politeness, without being altogether such slaves to ceremony; they are superstitious, inconstant, and intemperate. Their provisions are dressed and served up in an elegant taste; and they perfume both their tables and their dishes. Their usual fare consists of rice dressed various ways, eggs, pulse, roots, fowl, fish, buffalo, pork, beef, kid, and frogs. They have neither table-cloths or napkins; and, instead of forks, use ivory sticks as the Chinese do, and eat much in the same manner. The food of the common people is rice, dried fish, and pulse, and tea is their usual drink; but the higher classes mix arrack with their tea, and often become intoxicated with it. The grandees have halls in their houses, for the encouragement of singing and dancing in the evenings; and indeed, every villa hath its houses of mirth and jollity, where the people assemble, especially on their festivals, and cause plays to be acted: the actors are generally about half a dozen in number, and the dances are performed by the women, who sing at the same time. A merry-andrew too appears, exciting the laughter of the spectators by his drollery and humour. They have several kinds of musical instruments, such as kettle-drums, trumpets, fiddles, guitars, and hautboys.

These people celebrate a great number of festivals: two of them are kept with more than ordinary solemnity: the first is held at the beginning of the year, which at Tonquin commences with the new moon nearest to the end of January, and sometimes three or four days sooner: this feast lasts about 12 days; but the first day is rather a day of lamentation than of rejoicing, for they then shut up their habitation, and keep within doors, for fear, as they pretend, of meeting with some unlucky object in the street, which might prove to them an omen of ill-fortune in the course of the ensuing year. On the day following they begin their festivity, when booths and stages are erected in the streets, in which are represented different kinds of shows; nothing is heard but the sound of musical instruments, and the wild uproar of riot and licentiousness. The second grand festival is kept with the same kind of mad merriment, in the sixth moon; and, exclusive of these, they observe two monthly feasts, in which religion has some share, it being customary at these feasts to sacrifice to their ancestors, by oblations of provisions at their tombs. Another solemn feast is what they call can-ja, on which their king gives his public benediction to the country, and ploughs two or three furrows with his own hands; which custom the princes of Tonquin have undoubtedly

borrowed from the Chinese emperors: the natives practise fasting and prayers by way of preparation for this festival.

SECT. II.

Of their Marriages; of their Sciences, Language, Manufactures, Commerce, Religion, and Funeral Ceremonies.

IN Tonquin, as in China, young people must not marry without the consent of their parents; and females are seldom disposed of in marriage before the age of 16. When a young man seeks a maiden, he first applies to the father, and makes him a present. After the articles are agreed upon, the man sends to the house of the young woman such presents as have been stipulated, and on the wedding-day the fathers of both families, accompanied by their friends, conduct the bride to the bridegroom's house, where the ceremony is performed in great form. There is no wedding without a feast, which holds three or more days.

Though the men have the privilege of marrying several wives, yet only one takes the title of wife. The men are suffered to divorce their wives whenever they please; but the women cannot divorce themselves without consent of their husbands; however, when they are thus put away by their husbands, they have the privilege of taking with them not only the effects which they brought, but likewise the presents made to them previous to marriage; and if there be any children, these are left with the father to maintain: on this account very few divorces happen.

If a woman be convicted of adultery, she is condemned to be trampled to death by an elephant: the adulterer is also sentenced to die, but not to suffer so severe a death.

The Tonquinese are indebted to the Chinese for the greatest part of their arts and sciences: they are little skilled in the mathematics or astronomy; nor have they any public schools, the children being privately educated at home by their parents. The art of medicine here is principally confined to the knowledge of simples, and the physicians pretend to be as skilful as those of China, with regard to the pulse: they judge of the cause, seat and quality of the distemper, by the number of pulses in one respiration: their surgery is confined to the use of caustics and cupping, which they practise in most disorders, using gourd and calabashes in the latter instead of glasses. The fever, dysentery and small-pox are the most common maladies the people of this country are subject to, which they in general treat pretty successfully, by means of certain drinks and prudent regimen. They prescribe tea, as hot as it can possibly be drank, for the head-ach.

The language of these people abounds with monosyllables; one of them in some instances signifies 11 or 12 different things; the precise sense of which in conversation is only distinguishable by the different inflection and modification of the voice.

The Tonquinese have good manufactures of silk, potters ware, and paper; their varnished commodities are in good estimation; they work well in wood and iron, understand the art of foundery, and know how to cast cannon: but notwithstanding this their ingenuity, they make but little advantage of it, through want of genius for traffic. Their chief trade is with the Dutch and Chinese, who buy up their silk both raw and in thread; and they also sell large quantities of their wrought silk to the English. The articles chiefly imported into Tonquin are salt-petre, sulphur, English broad-cloth, &c. The traders are said to be fairer dealers than the Chinese.

It does not appear that these people have any coinage of their own, but make use of foreign coin, and particularly copper money, which they have from China.

As to the religion of the Tonquinese, they profess two systems, both received from their neighbours the Chinese; the one is that of Confucius, the substance of which, as held by them, consists in an inward devotion, or observance of some secret rites in honour of the dead, and in the practice of moral virtues: the professors of this system have neither priests, temples, or

any fixed mode of public worship, every one paying his adorations to the Deity in what form he thinks proper: they worship one God, whom they believe to have created the universe; and they also pay a kind of inferior adoration to some spirits, as the vicegerents of the supreme governor of all things. Some believe that the souls of persons are immortal, and that there is a future state of rewards and punishments; others, however, assign immortality only to the souls of the righteous.

The other religion which these people profess is that of Foe: this is the religion of most of the common people, who worship many idols; and indeed these have their temples and their priests; their temples, however, are no more than a kind of pent-house raised on props, in the figure of an oblong square, and open on every side, without any altar; the floor is generally raised some feet above the level of the ground, for its security against floods, so that it is ascended by steps on all sides. Idols, suspending from the roof, or placed in some part of the wood-work, make up all the furniture of these awkward buildings. The priests lead a very austere life, and subsist chiefly on alms; they reside in mean huts near the temples, to offer up the petitions of the people, as occasionally brought to them, which they read aloud to their idols, and then burn them in an incense-pot, the petitioners being all the time prostrate on the ground. The religion of Foe is divided into many sects, the most considerable is that of Lanzo, whose followers profess magic; they pretend to the prediction of future events, and are divided into different classes.

As to the funeral ceremonies observed by the Tonquinese, they dress their dead in their richest apparel, and put small pieces of gold or silver, together with pearls, into the mouths of the rich; and into those of the poor, are put little copper pieces and other baubles; they do this, from a supposition that they hereby secure the dead from poverty in the other world, and themselves from being haunted by them. There is great emulation among the opulent in providing fine coffins for themselves: in framing these coffins they make no use of nails, as this would have the appearance of laying a constraint on the deceased, but only cement the boards together.

The corpse is conveyed to the place of burial with great funeral pomp, the sons of the deceased attending, clothed in robes of grey cloth, and supporting themselves with a staff, as if ready to drop to the ground with immoderate grief: the wives and daughters follow, robed in grey, and crying most bitterly and loudly. The eldest son, during the procession, prostrates himself several times before the coffin, and sometimes thumps upon the lid of it, as if to awake his father from the sleep of death. The rest of the funeral solemnities of these people differ very little from those of the Chinese, and their mourning habiliments are exactly the same.

SECT. III.

Of the Origin of the Tonquinese; of the Revolution of the Kingdom; the triennial Tribute paid to China; of their titular, and their real Sovereign; their Government and Laws; their Army, and their Naval Force.

THE Tonquinese are of very ancient origin; but matters relating to the foundation of their government are buried in obscurity; for these people were many ages ignorant of the art of writing. One of the first kings mentioned in their history was Ding, said to have reigned 200 years before Christ, and to have been raised to the throne by a troop of banditti: he, however, reigned with such oppression, that his subjects revolted, and murdered him. This revolution and murder were followed by long wars, which at length terminated in the election of a king, named Le-day-han, in whose reign the Chinese invaded and over-ran the kingdom. This prince, however, defended himself with the greatest bravery, and defeated them several times, but could not drive them out of the country. Upon the death of Le-day-han, Li-bai-vie was placed on the throne, who vanquished and totally drove the Chinese from his territories. The posterity of this prince enjoyed a tranquil reign for several generations; and the

last king of this family leaving behind him but one daughter, this princess shared the throne with a nobleman whom she espoused; but another grandee, named Ho, conspired against the queen, subdued her husband in battle, put both of them to death, and took possession of the crown; his treachery and cruelty occasioned a revolt of his subjects, who applied to the Chinese for aid, and occasioned their entrance into the kingdom with a numerous army, which drove away the tyrant, and, as a reward for their services, took possession themselves of the government, forcing the Tonquinese to accept of a viceroy from China, who changed the form of the constitution, and introduced the Chinese laws and customs.

The Tonquinese, however, in process of time, headed by a man of a most intrepid spirit, named Li, took up arms against the Chinese, put them all to the sword, and compelled the emperor to assent to a dishonourable peace. Li was crowned king of Tonquin; and all that the Chinese were able to obtain was, that the kings of Tonquin should hold the crown in fealty under the emperor of China, and pay them a triennial tribute. This treaty was concluded about the year 1200 of the Christian era, and both nations have faithfully observed the articles of it ever since. The Tonquinese send ambassadors to Peking every three years with their tribute, who do homage to the emperor; and the latter also sends his ambassadors to Tonquin, who behave with the utmost haughtiness; insomuch that when the king has occasion to treat with them on any important matters, he is obliged to wait upon them, instead of their attending upon him: nor can a prince of Tonquin ascend the throne of his ancestors without a confirmation from the hand of the emperor of China.

The descendants of Li sat upon the throne for two centuries, after which ensued many revolutions. About the year 1260 of the Christian era, a simple fisherman, named Mack, usurped the crown, but was dethroned by Tring, another usurper, who covered his usurpation with the pretence of restoring the family of Li to the throne, and accordingly caused a young prince of that house to be crowned; but whilst he bestowed on the prince the title, he reserved to himself the regal power, under the name of Chova, or general of the realm.

Tring had a brother-in-law whose name was Hoaving, son of a governor of the province of Tingwa, to whom Tring lay under some particular obligations; for this governor had not only been greatly his friend, in assisting him in his enterprise with the troops of his province, but likewise disposed of his daughter to him in wedlock; and, moreover, on his death-bed committed to him the guardianship of his only son, who was this Hoaving above-mentioned. Hoaving reflected with great concern on the conduct of his brother-in-law and guardian, in having employed his father's forces to set any other than himself (Hoaving) on the throne of Tonquin, and conceived on the occasion such a spirit of resentment, that he not only refused to do homage to the new king, but openly took up arms; possessed himself of Cochinchina, an antient province of Tonquin, and, after the example of his brother-in-law, caused himself to be proclaimed chova at the head of his army. These two generals governed with absolute authority, the one in Tonquin, and the other in Cochinchina, and

waged war with each other as long as they lived, with success nearly equal on both sides. They transmitted the title of chova to their successors, and their descendants enjoy it to this present period of time in both kingdoms. But we shall here confine ourselves to the chova of Tonquin, where indeed are at present two supreme magistrates or sovereigns, the one titular, the other real: the former has the name of bova; but in the chova are vested all the powers of government. The authority of the bova consists principally in giving the form of ratification to the decrees of the chova. The dignity of the latter is hereditary, and his eldest son succeeds him; but the succession of bovas is uncertain; for when a bova leaves several sons, the chova chuses which of them he pleases, and may even raise a collateral branch to the dignity.

Each province in the kingdom of Tonquin hath its particular governor, and every governor has a mandarin for his lieutenant, who has the care of administering justice, and of seeing that the laws are properly observed, which indeed are the Chinese laws, as introduced amongst them in the twelfth century: nevertheless, they have some particular original constitutions of their own; and it has been observed, that in several of their antient laws, there are more manifest testimonies of equity and humanity, than in some of the usages practised by the Chinese; however, on the other hand, it is an incontestable fact, that some of the courts of judicature in Tonquin are so corrupt, that there are few offences for which money will not purchase impunity.

The bova, who has only the shadow of authority, lives shut up in his palace, and his court is very little resorted to; whereas the court of the chova is graced daily with a splendid appearance of company of the highest rank. The chova keeps a great number of concubines, it not being customary for him to marry till his advanced age affords him but little hope of his having any more children; when he always espouses a princess of the royal family, who ranks above his concubines, and bears the title of Mother of the kingdom. The concubine who bore the king his first son, is treated with distinguished honour, and takes place next to the queen.

The army of the king of Tonquin consists of 150,000 men, exclusive of 10,000 horse. The soldiers are picked men out of the different villages, and it is the chief pride of the officers to have the firelocks of the men neat and bright: they are so nice in this respect, that if the arms become rusty, they stop a week's pay of the soldier's wages for the first offence, and for the second inflict corporal punishment. When the army marches, the generals, and other principal officers, ride upon elephants.

The Tonquinese are by no means good soldiers; and this may, in a great measure, be attributed to the inefficiency of their officers, to the want of military encouragement, to the influence of money, and to the favour of the great.

The naval force of Tonquin consists of a considerable number of galleys, barks, and boats; but these are better calculated for coasting on the sea-shore, than for long voyages. They have no sails, but make use of oars only.

CHAP. XV.

COCHIN-CHINA.

SECT. I.

Of its Situation, Extent, Boundaries, Produce, Inhabitants, &c.

THIS kingdom is situated under the torrid zone, and extends, according to some, from the eighth to the 17th; and, according to others, from the 12th to the 18th degree of north latitude; it is about 500 miles in length, and is bounded on the east by the Chinese Sea, on the west by Laos and Cambodia, on the south by Champa, or Chiampa, and on the north by Tonquin. It was originally a province of Tonquin, but has, for upwards of 300 years, formed a distinct kingdom, and is, like Tonquin, tributary to China.

This country produces great plenty of rice and sugar; and they have gold and silver mines. Here are also eagle wood, calambac, an ordinary sort of tea, and several kinds of drugs. The kingdom is divided into five or six provinces, and is well peopled: the king resides at the capital of Ke-hue. Along the coast are several islands subject to this kingdom, which produce many useful fruit and other trees.

Cochin-China is visited by a regular annual inundation, happening about the middle of autumn, and overspreading the country for two months; it leaves behind it a kind of slime, which helps to fertilize the land. In this wet season the people fall about the country in barks; nor would they be secure in their habitations, were they not to erect them on piles, so as to leave a free passage for the water below.

The houses are built of canes entwined together, so that the walls resemble the sides of a wicker basket; and these they plaister over with a mortar made of dirt or lime. They cover their habitation with straw, or the leaves of cocoa, and they consist in common of one story; the window frames are closed up with Japan paper, or Naker shells ground to transparency; the partitions of their chambers are formed of screens, and their floors are covered with mats, which serve them both for seats and beds: in the houses of the opulent, indeed, the rooms are furnished with handsome chairs.

The Cochin-Chinese are a temperate people, and the chief of their food is rice and fish, which they have in great plenty: they have no kitchens in their houses, for fear of accidents by fire, but dress their provisions by the river's side; for the country abounds with rivers, on the banks of which their towns are built: and when the wind blows from the sea, it is customary for a soldier to go about beating a drum, as a signal for people to extinguish their fires.

The Cochin-Chinese, though but imperfectly civilized, possess that felicity which might excite the envy of more improved societies. They have neither robbers nor beggars; and hospitality is seen in every habitation. A traveller freely enters a house in any village, sits down to eat and drink without any invitation, and departs without acknowledging the civility: he is a man and fellow-creature, and therefore welcome: if he were a foreigner, he would excite more curiosity, but would be equally welcome.

Though pride and luxury are not in general encouraged by these natives, yet the wealthier sort know how, occasionally, to entertain their friends in a sumptuous

manner: at these times their tables vie with the European, either in variety or cookery.

The common people, at public festivals, assemble in the streets, where they spread their mats, and, sitting in a circle, eat their provisions, while tumblers and merry-andrews exercise their mummery.

SECT. II.

Of the Obvya, or King; of the Government and Laws of the Cochin-chinese; their Mechanics, Trade, and Money.

THE king of Cochin-China is a despotic monarch, and so difficult of access, that the most considerable or opulent of his people must not presume to present a petition to him, without previously making court to his chief minister of state. He gives audience at his palace gate in a sort of state-litter, superbly gilt, and somewhat resembling a cage. No persons must approach nearer to him than at the distance of fourscore paces. His palace, as hath been observed, is at Ke-hue, the metropolis, where, after the eastern custom, he keeps his seraglio, guarded by eunuchs. As there is nothing very strikingly magnificent in the palace, we will not trouble our readers with an account of it. When he goes abroad, he rides on an elephant, on which he always sits side-ways, and is accompanied by guards: on his head he wears a turban of the finest calico; pendants of the richest brilliants hang from his ears; he has bracelets on his arms, but his body is almost bare, having only a covering round his middle, and he holds a spear, or rather a long javelin, in his left hand.

The provinces of Cochin-china are governed by mandarins, and different courts of justice; and if a mandarin should be convicted of mal-administration, he is, at a certainty, punished with death. Not only all the officers of state, but even the lives and fortunes of the people, are entirely at the disposal of the king.

In cases of treason and rebellion, the laws of this country are exceedingly rigid; these capital crimes are not only punished with the most dreadful tortures, but very severe penalties are likewise insisted on all the kindred of the traitors. Other offences, that are in any degree heinous, are punished with death, or the loss of a limb: though it must be acknowledged, that the all-powerful influence of money too frequently shelters the guilty from the punishment due to their crimes.

The Cochin-Chinese, though totally unacquainted with the sciences, are very skilful mechanics; and, in the manufacture of silk, they far surpass the Tonquinese. They make sugar-mills and water-engines, but know not how to make any sort of fire-arms. Their foreign trade is by no means considerable; silk, cotton, betel, aloes, wax, japan wood, cassia, and sugar, are the chief articles they export; the greater part of which are purchased by the Chinese, who, indeed, have nearly engrossed the whole of this trade to themselves. The only money current in this country consists of pieces of copper struck in China, like those used by the Tonquinese. Silver is exceeding scarce with them, inasmuch that a man deemed wealthy, who is possessed of 80 or 100 piastras.

The state of their religion, their marriages, funeral ceremonies, &c. are the same as at Tonquin.

C H A P. XVI.

Of the Kingdom of CAMBODIA, or CAMBOYA; with
the Island of PULO-CONDORÉ.

S E C T. I.

Situation, and Extent of the Kingdom; Produce of the Country; Persons and Drefs of the Inhabitants; their Manufactories and Employments.

THIS kingdom is situated on the east side of the gulph of Siam: it is bounded on the west by Cochinchina; by the Indian Ocean on the south; and by the kingdom of Laos and the Kemois mountains on the north. It extends from north to south upwards of 300 miles, and is about 210 miles in breadth. The river Mecon, which is very spacious, runs through it, and falls by two channels into the sea. At the place where it first rises, it is called Longmu, after which it takes the name of Mecon, and continuing that name for a considerable space at length changes it to Ou-bequanne. This river has an annual swell, which begins in the month of June, and continues till August, when it generally rises so high as to overflow the neighbouring countries. It runs the same way for six months together, owing to the southerly winds, which drives the sands in such shoals that the bar is entirely stopped up, and the current is by that means driven back, till the wind shifts and removes the sands, when the current is restored to its regular course.

The country in general is exceeding fertile, and produces various kinds of grain, particularly rice and corn. There are likewise a great variety of fruit-trees, as orange, citrons, mangos, cocoas, &c. Here are also several kinds of wood, as the sandal, aquila and japan, stick-lack, and lack for japanning.

Rice here is exceeding plentiful and cheap, as are also flesh and fish; the two last of which are the only articles allowed to be purchased without a permit from the king. A fine bullock is frequently purchased for a dollar; and the common value of rice is one shilling and sixpence for 140 pounds weight. Poultry, indeed, is very scarce, because the few that are bred, when young, retire to the woods, where they shift for themselves; nor do the people take any pains to seek after them.

The country produces several kinds of rich commodities, particularly gold, cambogia of a gold colour, or deep yellow, in rolls, raw silk, and elephants teeth. There are likewise several sorts of very valuable drugs; and many parts abound with amethysts, garnets, sapphires, cornelians, chrysolites, and blood-stones.

The animals of this country are, wild elephants and boars, which are exceeding numerous, particularly in the woods; tigers and lions; also wild cattle and buffaloes; with many horses, and a prodigious number of deer; all of which every person has free liberty to kill and convert to their own use.

The inhabitants of this country are in general well shaped, and the women in particular are exceeding handsome. The men wear a long vest which reaches from the shoulders to the ancles, but their head and feet are bare. The women wear a thin garment that fits quite close on the body and arms; and have a kind of petticoat that reaches from the waist to the ancles. Their heads have not any covering, but their hair is dressed, and curiously decorated. Both sexes have long hair, and take great pains in displaying it to the greatest advantage.

Their religion is the same as that of the Siamese, and they worship the same deities. They believe that all animals, as well as human beings, will be hereafter rewarded or punished. Their priests are chosen from among the laity, and are little respected by the people

in general; nor have they any other provision for their existence than what arises from public benevolence.

There are several manufactories in different parts of the country, for making calicoes, muslins, dimities, and other curious pieces, which are much superior in quality to those made in Holland and other parts.

The poorer sort of people are employed in making beads, small idols, bracelets, necklaces, &c. They also weave silk, and work curious tapestry, which is used for lining chairs and palanquins of the quality.

S E C T. II.

Of the City of Cambodia.

THE only city in this kingdom that merits the least notice is Cambodia, which is situated on the river Mecon, about an hundred miles from the bar. It is built on a rising ground in order to avoid the annual overflowings of the river, and principally consists of one large street. About the center of it is a palace for the residence of the prince: it is a very insignificant edifice, surrounded by a kind of wall, with ramparts, in which are several pieces of artillery.

The power of the prince is despotic, and favours are only obtained from him by pecuniary compliments. When he thinks proper to distinguish any peculiar favourite, he presents him with two swords, one of which is called the sword of state, and the other the sword of justice. The person on whom this honour is bestowed receives them with the greatest marks of humility, and after prostrating himself to the ground, retires. When he has received this high dignity, the swords must be always carried before him whenever he goes abroad on public occasions, and all people are obliged to compliment him in words adapted to the elevation of his character. If he meets with another who has received the same preferment, they enquire of each other the time of their being honoured with this great distinction, and he who last received it must first salute his superior. These persons are empowered to hold courts of justice; and the choice of punishment, whether in civil or criminal cases, is left solely to their determination.

They have only one sort of coin in this kingdom, which are called Galls: they are small pieces of ordinary silver, with characters on one side, but plain on the other; and are valued at about four-pence sterling.

S E C T. III.

Of the Island of Pulo-Condore.

THERE are several islands which lie off the coast of Cambodia, the most distinguished of which is Pulo-Condore, situated about twenty leagues south from the westernmost channel of the river Cambodia. It is between four and five leagues long, and is the only inhabited island on the coast.

The natives of this island are of a middle stature, and well shaped, but their complexion is exceeding swarthy. Their hair is strait and black; their eyes are remarkably small, and their noses high; they have thin lips, small mouths, and white teeth; and in their disposition are very courteous. They go almost naked, except on very particular occasions, when they are dressed in a long garment girded about the waist, and ornamented with various coloured ribbands.

Their houses, which are very small, are built of bamboos, covered with long grass. They are raised several feet from the earth, on account of the dampness of the ground; and they have neither doors or win-

dows, so that one side is left open, as well for convenience of light, as for the entrance of the people.

Their religion is the same with that of the Pagans, and they worship idols, representing horses and elephants. In a small village, on the south side of the island, is a temple, which is a mean edifice built of wood: within it is the figure of an elephant, and without is that of a horse.

This island produces several kinds of fruit: among these is one about the size of a perch, which is very juicy and grateful to the palate, and has so fragrant a smell as to perfume the air at some distance. Here are also several sorts of trees, particularly a tall one near four feet in diameter, in which the inhabitants make an horizontal incision half way through, about a foot from the ground, and then cutting the upper part slope-ways within till it meets with a transverse incision, a liquor gradually falls into a hollow, made in the semi-circular stump, which, when boiled, becomes good tar, and if boiled still more, comes to the solidity of pitch, instead of which it is used. One of these trees will produce two quarts of juice every day for a month together, when it dries up, but will recover itself in a very short time.

There is great plenty of grapes here, both red and white, that nearly resemble ours, and have a very delicious taste. They grow on a fruit tree, whose trunk is about a foot in diameter, upon which the fruit hangs in clusters, in the same manner as the fruit of the cocoa-tree. Here are likewise wild nutmeg-trees, the fruit of which grows among the boughs like that of the wal-

nut-tree. It greatly resembles the true nutmeg, but is smaller, and without either taste or smell.

Here are several sorts of fowl, as turtle doves, pigeons, wild cocks and hens, parrots and parroquets; also several kinds of animals and reptiles, as hogs, granes, lizards, &c. and the sea produces a great plenty of turtles, limpets and muscles.

Although this island is conveniently situated for carrying on a trade with Japan, China, Manila, Tonquin, and Cochinchina, yet the natives in general are very poor, and have little other employment than gathering the juice of the pitch-tree, and making turtle oil, by boiling the fat of the turtle, which they export in great quantities to Cochinchina. Another article in which they are employed is making brine for salting small fish, like anchovies, that are caught here in great abundance.

The English settled on this island in 1702, when the factory of Chusan, on the coast of China, was broke up. However, they continued here but a short time, for having made an agreement with some Macassars, natives of the island of Celebes, to serve for soldiers, and assist in building a fort, and not discharging them at the end of three years, (for which time they were engaged) they rose in the night and murdered every Englishman they could find on the island. The island had been purchased by the English of the king of Cambodia, to whom, after this circumstance, it again reverted. The fort was principally demolished, but some few remains of it are still standing.

CHAP. XVII.

Of the KINGDOM of LAOS.

SECT. I.

Its Boundaries and Produce; Nature of the Inhabitants; their Manners, Customs, Ceremonies, &c.

THIS is a rich plentiful country, but is little visited by Europeans. It is bounded on the east by Cochinchina and Tonquin; on the west, by Siam; on the north, by the lake Chamay; and on the south, by Cambodia and Siam. Its extent cannot with certainty be ascertained; but the general opinion is, that it reaches from the 15th to the 25th degree of north latitude.

The most valuable article produced in this country is Benjamin, which is esteemed the best in quality of any throughout the Indies; it grows in great abundance, and brings so considerable a revenue to the king, that the exportation of it is severely prohibited. The gardens abound with a great variety of fruit, and they have rice in abundance, which, though different in taste from that of any other country, is esteemed the best in the east. They have a great plenty of honey, wax, cotton, amber and musk; and ivory is so little valued, from the great number of elephants with which the country abounds, that the teeth are used for fences to their fields and gardens. They have prodigious herds of bees and buffaloes, and the rivers abound with all kinds of fish, some of which are of an immense size. In these rivers are found gold and silver dust; and in several parts of the country are mines of iron, lead and tin. Salt is also produced here in great abundance, and prodigious quantities of it are exported to foreign parts. It is formed by a white froth left on the rice fields after harvest, which afterwards becomes condensed by the heat of the sun.

The Langians, or inhabitants of Laos, are naturally very affable in their disposition; and though they envy such as are in a more eligible situation than themselves,

yet they are strictly honest, and appear to be utter strangers to avaricious sentiments. They are in general well shaped, and though their complexion is of an olive cast, yet they are much fairer than their neighbours; the women are very modest in their carriage, and in other respects little inferior to the women of Portugal.

Their food principally consists of rice, the flesh of the buffalo, and several kinds of pulse: they eat four meals a day, and have very great appetites, notwithstanding which, they are seldom afflicted with any diseases. They sometimes eat fowls, which they dress without plucking off the feathers; and they kill them by striking them on the head with a stick, the shedding of blood being considered as one of the greatest crimes.

Their employment principally consists in husbandry and fishing; but they are naturally of an indolent disposition, nor will they attend business till they are reduced to it from absolute necessity.

A robbery is here seldom heard of, but when such circumstances do happen, if the criminal cannot be found, the neighbours must make restitution to the parties injured.

If a woman is found guilty of adultery, she is deprived of her liberty, and for the rest of her life is considered as an absolute slave, and must be subject to such severe treatment as her husband shall think proper to inflict.

Their marriage ceremonies consist only in the parties promising before two who have been some years joined in wedlock, that they will be true to each other so long as they shall live; but they often part from the most trifling circumstances, and this may be attributed to the insignificance of the mode by which they are joined together.

Fornication is permitted among the laity, but the talapouns, or priests, are prohibited from it under severe punishments. Polygamy is also allowed; but the first

wife

wife has the pre-eminence, and must be treated with great respect by the others, who are considered more as her servants than her companions.

They strongly believe in sorcery; to prevent the effects of which, during the time a woman lies in, all her relations and friends repair to the house, and divert themselves with singing, dancing, and other amusements. They do this that the magicians or forcerers may not come near the woman; for should that be the case, they would immediately take it for granted, that the infant was bewitched.

A great festival is also held on the death of a person: it is celebrated with much splendor, and continues for a month, at the expiration of which a pyramid is erected, on the top whereof the corpse is laid: the talapoins or priests (who are the only persons invited to the festival) then sing certain songs, which they assert qualifies the soul of the deceased for the mansions of paradise. After the priests have finished their songs, the pyramid is set on fire; and when the body is consumed, the ashes are conveyed with great ceremony to the pagod, or usual place of interment, where the better sort of people erect magnificent tombs to perpetuate the memory of their ancestors.

The Langians profess the Pagan religion. Those who deny the transmigration of souls affirm, that the wicked, after death, are irredeemably lost; but that the good assume a body of air as light and pure as the sun, and that after insensibly passing through 16 heavens, where they enjoy the most celestial felicity, they return to their natural shape, and are for ever after in a perfect state of happiness.

When they are ill, they implore the favour of those souls whom they suppose to be in the celestial state, which they do by making them presents, inviting them to eat with them, and entertaining them (in idea) the same as if they were really present, and heard and saw every transaction; and to add to the solemnity, they sing particular songs, attended by a rough kind of music, which is continued day and night till the patient either recovers or dies.

The talapoins or priests are in general very indolent; and though they originate from the most humble stations, yet on their being elevated to the dignity of priest, they assume the most distinguished arrogance. They are under tuition from their childhood till they are 23 years of age, when they undergo an examination, and if approved, are immediately appointed to the order of priesthood.

SECT. II.

Of the Power of the Sovereign; his Dignity, and the particular Homage paid him on all public Occasions; his Officers of State, &c.

THE sovereign of Laos preserves an unlimited power in all cases, whether civil or ecclesiastical; and all honours and employments are solely at his disposal: the private property of individuals is subject to be converted to such purposes as he shall think proper; so that no family can be said to enjoy their own possessions. When a person dies, all his effects become the property of the king, except those which are moveable; so that in fact no person, who has an estate in land, can properly call it his own. The priests, indeed, have the peculiar privilege of disposing of such things as are immediately occupied; but their property in land is under the direction of mandarins, who let it out to farmers, and one half of every third year's rent is converted to the use of the king.

The king considers himself as superior to all other sovereigns, and the greatest homage is paid to him by all ranks of people. In order to impress his people with a due sense of respect for him, he appears in public twice every year; and his subjects are so flattered on this occasion, that they testify their happiness by the most distinguished rejoicings.

The characteristic by which he distinguishes his superiority over other princes, is from the length of his ears, which are so distended as to hang upon his shoulders. This is considered as a mark of the highest dignity; and the means for obtaining it are used in their

infancy, when the fleshy parts of the ears are repeatedly bored, and they are extended by weights hung at the ends of them. The people in general are very fond of large ears, but they must be careful that the dimensions of them do not come near to those of their sovereign's.

When the king appears in public, his subjects exert themselves to express loyalty to his person and government. They bring a variety of wild beasts, particularly elephants, which they decorate with the most superb trappings: they have also wrestlers, gladiators, &c. all of whom assemble in a large area, or field, before the king, who is diverted with their various exhibitions.

The splendor of the king's court is most distinguished when he goes with the mandarins and nobility to offer presents to some distinguished temple. On this occasion the king is seated on a beautiful elephant, decorated with trappings of gold, which hang from his sides to the ground; and the king is dressed in the most sumptuous manner, his garments being loaded with diamonds of immense value. The mandarins go in front, the king follows next, and the nobility close the procession. These last are mounted on fine horses elegantly decorated, and with them are a great number of cattle, richly dressed, and laden with presents for the idol.

The women are prohibited from being seen in the streets on these days: they therefore look out at their windows when the procession passes, and sprinkle scented water on the king, and the presents that are going to be offered to the idol. The talapoins are dressed in their richest habits, and meet the king as he arrives at their respective convents, after which they attend him during the time he sacrifices the presents to the idol.

There are several tributary kings that come to court, in order to pay homage to the king of Laos, and they acknowledge their submission to him by magnificent presents.

The king's principal officers are seven viceroys, the chief of whom is distinguished by the title of viceroy-general. This officer executes the principal business of the government; and on the death of the king, adjusts all matters, and disposes of all employments till a successor is chosen to the throne.

These viceroys are governors of the seven provinces, into which the kingdom is divided. They support their characters with the highest dignity, and are always consulted by the king in matters of a public nature. They have each a deputy, who officiates for them in the respective provinces, during their absence, or when the affairs of government command their attendance at court.

The viceroy-general has the distinguished privilege of riding on an elephant in all public processions; but the others are only permitted to go in chairs, attended by a number of servants dressed in one uniform. The mandarins, and all other inferior officers, go on foot, without any attendants.

Every province has a militia of horse and foot, who are maintained at the expence of that province to which they belong; and the officers are all dependant on the viceroy-general.

As the king is an absolute monarch, they have but few laws; but every family has a chief, to whom the rest are all subordinate; except the talapoins, who are exempted from it on account of their sacred characters. These vassalages are a convenient security to the state, because, on any emergency, the king, by giving notice to the chiefs, can assemble a considerable army in a very little time.

If any chief is convicted of committing a capital offence, all his relations are immediately deprived of their positions, and are for ever after employed in discharging the most servile offices. Crimes are here punished with such severity, that there are few offenders; and in all civil affairs the judge's determination is absolute.

SECT. III.

Of the capital City of Laos.

THE capital city of this kingdom is by some called Lanchang, and by others Lanjeng. It is situated in the interior part of the kingdom, in 18 deg. north lat.

It is defended on one side by the great river Lao, and on the other, by high walls and extensive ditches.

The most distinguished edifice in this city is the palace, which is very lofty and magnificent, and, with the offices and other buildings, extends more than two miles in circumference. The architecture is exceeding grand, and the apartments within are furnished in the most sumptuous manner: the basso relievos, in particular, are so richly gilt, as to appear as if covered with panes instead of leaves of gold.

A French historian, after describing the elegant construction of the palace, as well as the magnificence of its furniture, says, "There is likewise as extraordinary a temple, with a tower of 100 cubits high, and thin plates of gold, which being moved by the wind, make a delicate harmony." This writer, however, in all his descriptions borders so strong on the marvellous, that there is great reason to doubt the truth of his assertion; more especially as it doth not appear that the circumstances related by him are confirmed by any other traveller.

The houses of the better sort are built of wood, and are very lofty and handsome; but those of the common people are very low and mean, and chiefly made of dirt and clay. The talapins or priests have liberty to build their houses of brick or stone; but all others are restrained from the like indulgence.

The houses of the quality are in general very elegantly furnished; instead of tapestry they line the walls with mats beautifully wrought, and ornamented with foliage, and a great variety of very curious figures.

The inhabitants are all Pagans, and have temples which contain the idols they worship; they are more strict in the execution of their religious ceremonies than the people in any other part of the kingdom, and pay much greater respect to their priests.

There are several other towns dispersed in various parts of this kingdom; but neither of them contain any thing that demands the least attention of the traveller.

CH A P. XVIII.

OF T I B E T.

S E C T. I.

Situation, Extent, and Boundaries; Climate, Soil, natural Produce, Rivers, &c.

TIBET, the last place we have to mention on the continent of Asia, is situated in an excellent climate, between 30 and 40 deg. north lat, but it is surrounded with very extensive mountains. It is called by the Tartars Barantola; but then it includes all that large track between the great river Ya-long, and the source of the Ganges. The Chinese call it Tfan or Tfan-li, and the inhabitants of Casimere, as well as those on the other side the Ganges, call it Butan or Buton. The country is divided into three principal parts, namely, Great Tibet, Little Tibet, and Lassa. This last division being the most rich, as well as the most plentiful province, and the residence of the grand lama, it frequently gives name to the whole country.

Tibet is bounded on the east by China; on the west by Indostan; on the north by the country of the Mongols; and on the south, by Ava. The whole country extends in length, from east to west, upwards of 1700 miles, and the broadest part of it from north to south is about 1780.

The climate of this country is in general very temperate and healthful; but on the western parts it is cold, especially on the tops of the mountains. Though the land is in most parts high, yet it is often overflowed from the great torrents of water that pour down the rocks after heavy rains. The mountains are so close together, that the tops of them seem almost to join, and the rocks which lead up to them have so dreadful an appearance as to strike the greatest terror in the mind of the spectator. There is a road between the mountains, but it is so narrow as to be not only inconvenient, but very dangerous to travellers, and in some parts bridges are made across the avenues that lead from one mountain to another, for the convenience of passengers during the times of the floods.

The soil of this country is in general fertile, and produces great plenty of rice and pulse. It is particularly famous for the produce of rhubarb and musk; the latter of which is esteemed the best of any to be met with in India.

Here are many rivers, several of which produce great quantities of gold, particularly the Kin-cha-kyang, which enters the Chinese province of Yun-nan, whose name signifies, the river with golden sand. It is from some one of these rivers that China is supplied with gold, which in purity is said to exceed that brought from all other parts. It is uncertain where many of the rivers in this country discharge themselves. The Nukyang, which is a very principal one, enters Yun-nan, and after a considerable course changes its name to Lukyang, from whence it passes into the kingdom of Ava. The Lantian-kyang also enters Yun-nan, and after being joined by several small rivers, becomes the Great Kiw Long Kyang, (that is, the river of the Nine Dragons) and flows into the kingdom of Tonquin. The great river, which runs through Tibet, is called Yuratsan-pu or Dfan-pu: this river flows from the east of the mountain Kentsau, but it is difficult to determine where it discharges itself: it is supposed to fall into the bay of Bengal, about Aracan, or near the mouth of the Ganges in the Mogul's empire, which is called by the inhabitants of Tibet, Aronkek, or Anonjen.

The towns in Tibet are in general exceeding small, and very poorly inhabited; nor is even Lassa, the principal place of the country, in the least fortified. Indeed, there is but little occasion for fortifications here, the Tartars in their wars rather chusing to fight in the open fields, than to undertake sieges.

Great Tibet, the second province in this country, is situated to the north-east of Kishmar; and its climate is much the same as that of Lassa, it being surrounded with high mountains. The soil is also very fertile, and produces various kinds of grain; but they have few trees and little fruit.

Little Tibet, which is also exceeding mountainous, is situated to the north-west of Kishmar, and is bounded on the east by Great Tibet. The soil is in general good, and some parts of the province produce very rich fruits, particularly melons.

The trade of this country is but very small, the chief articles produced in it being wool, musk, coral, amber, and jasper. This last is a stone of a bluish cast, with white veins, and is so hard as to be cut only by a diamond. It is esteemed of great value, inasmuch that very

S E C T. II.

*Persons of the Inhabitants of Tibet; their Dress, Customs,
Language, Religion, &c.*

THE natives of Tibet are in general a very robust
people, and of the most healthy constitutions.
They have an olive or tawny complexion, their noses
are flat, and their faces very broad; but the women are
much handfomer in their features than the men. They
are naturally very indolent, and the common people in
particular are exceeding filthy. The garments of both
sexes are alike, consisting of a large piece of coarse
cloth fastened round the body by a girdle; and on
their heads they wear a kind of bonnet, which is de-
corated with pieces of tortoise-shell, and other trifling
baubles; but the better sort ornament them with coral
and beads of amber. Both sexes wear bracelets on their
left arms, which are fastened with beads, and round
their necks is a silk twist, from whence hangs a long
string ornamented with coral, and at the end of it is a
beaver's tooth.

The poor people live principally on rice and pulse,
though they have various kinds of flesh; they are in
general very temperate in their diet, but will often drink
to excess, and are exceeding fond of spirituous liquors.
They have a particular veneration for the cow, which
they never kill, as they consider that animal in the most
sacred light.

The houses of the better sort are tolerably handsome,
and chiefly built of wood; but those of the common
people are low mean huts, made of stones rudely piled
together.

Their language bears a strong affinity to that used by
the natives of Si-fan, a country which lies contiguous to
three Chinese provinces; for which reason the Chi-
nese extend the name of Si-fan throughout Tibet, not-
withstanding the forms and customs of the two coun-
tries are totally different. This language consists of
four vowels and 20 consonants; 95 compound charac-
ters, and ten double letters.

The king is a despotic prince, and is as it were secluded
from his subjects; for he very seldom leaves his palace,
and when he does it is so privately, that it is a great
rarity to obtain the sight of him. All business of a
public nature is referred to his prime minister, who,
unless it is a matter of some very singular tendency, ad-
justs it without ever consulting the king. When am-
bassadors desire audience of his majesty, they apply to
the prime minister, who, if he approves of their embassy,
presents them to the king; on which occasions his ma-
jesty is seated on a throne, dressed in the most sumptuous
apparel, and on his head is a crown ornamented with
the richest diamonds.

With respect to the religion of Tibet, in some parts
they are Mahometans, and in other parts they profess
Paganism; but the latter are much less superstitious
than those in other idolatrous countries. They are per-
mitted to eat flesh; and in most particulars greatly re-
semble the maxims used by the church of Rome. They
differ entirely from the Indians in their religious prin-
ciples, as they reject male-polygamy, and the doctrine of
the transmigration of souls. They chaunt their prayers,
and present offerings in the temples, which they receive
again from the priest in the most solemn and devout
manner.

The great number of lamas or priests in Tibet is
almost incredible, there being scarce a family without
one. These people obtain the sacred function either
from a principal of devotion, or from an expectation of
preferment in the service of the grand lama.

Before the war between the inhabitants of Tibet and
the Calmuck Tartars, the grand lama was sovereign of
all Tibet; but since that time he has relinquished all
temporal concerns, and dedicated himself solely to those
of a spiritual nature. He therefore appoints a governor
to act in his stead, who is distinguished by the name of
Tipa.

All the lamas are prohibited from marriage, and from
having any concern in worldly employments. The
tipa, or governor, wears the lama habit, which consists
of a frize garment reaching to the ankles, with a hat of
a red or yellow colour, edged with gold. The others
wear various kinds of bonnets, by which they are
distinguished according to their respective dignities.

The grand lama resides near the city of Lassa, in a
spacious pagoda or palace, and is revered by all ranks of
people in the most sacred manner. On particular days
he is seated on a kind of altar richly ornamented with
gold, above which is a grand canopy, and beneath his
feet, a magnificent cushion. Here he receives the adora-
tion not only of his subjects, but even strangers of
the most elevated characters, who come from different
countries to pay him homage, relate the sufferings they
have undergone in the course of their pilgrimage, and
to obtain his blessing. Even princes themselves are
happy in obtaining this singular benefit; nor is there any
greater respect paid to them than to the meanest vassal.
The grand lama considers himself so highly distinguished
above the rest of human beings, that he never conde-
scends to move in the least from his situation, or to
offer any return of salute, even to a prince; he only
lays his hand on the heads of his worshippers, who re-
tire with a confidence of mind that all their sins are
pardoned.

This strange adoration arises from the exalted idea
the people entertain of the power and holiness of the
grand lama. They believe that the god Fo lives in
him, and that he is immortal; so that after he dies, the
soul changes its abode, being placed again in an entire
new body; and that the place of his residence is made
known by certain pretended tokens, which can only be
discovered by the other lamas.

The most distinguished idol worshipped by these peo-
ple is called Manippe, which is represented with nine
heads placed in rows above each other in the form of a
cone. Before this image they perform their sacred
rites, and amidst their ejaculations exclaim, "O Ma-
nippe mi-hum!" that is, "Manippe save us!" In
order to obtain the favour of this idol, they frequently
place before it various kinds of provisions, of which
they earnestly entreat it to participate; and those are
the happiest who in this case can procure the greatest
dainties.

Besides the grand lama, there are several other princes
in Tibet who assume the lama habit; and under the
titles of his chief officers, preserve power independent of
him, and receive a peculiar homage from the people.

The dignity of lama is not alone confined to the na-
tives of Tibet; the Chinese and Tartars go to Lassa to
obtain it; for to be admitted into the number of the
grand lama's disciples is considered as the summit of all
earthly enjoyments. These never exceed 200, out of
whom are chosen the inferior lamas, that live in pagodas,
and are treated with the greatest respect by the people
where they reside. One of the most distinguished titles
among these is the Hutuktus, who are considered as
little inferior to Fo himself; but these are not confined
to the pagodas, nor even to Tibet, but have liberty to
settle where they think proper; and many of them
obtain considerable wealth by the liberal offerings of
their numerous worshippers.

Some of the lamas are tolerably well skilled in physick
and surgery; and others are acquainted with astronomy
and the calculation of eclipses. Few of them, however,
can read their ancient books, as they are written in a
language which has been a long time discontinued.

The inhabitants of Great Tibet somewhat differ in
their religious ceremonies from those of the other pro-
vinces. The supreme deity, whom they worship, is
called Conchock, and they have another named Urgien,
who they believe was born of a flower; and the idol
they worship, in consequence of this opinion, is the
statue of a woman, with a flower in her hand, who
they say was the mother of Urgien. They likewise wor-
ship saints, and use beads in repeating their prayers.
The lamas here have a particular dress from those in
the other provinces; they usually associate and live to-
gether, and are held in the highest veneration by the
3 B laity.

laity. They have superiors according to their respective dignities; and one above the rest is so distinguished, as to be treated with the greatest respect even by the grand lama himself.

The laws of this country are but few, as offences are very rarely committed; and in all matters of a trifling nature, the administration of justice is vested in the lamas; but capital cases are referred to the grand lama.

The men are prohibited from polygamy, but the women are allowed several husbands. The first child born is taken care of by the first husband, and those born after by the other husbands, according to the priority of their marriage.

We have not any particulars relative to the history of this country before the last century; at the beginning of which, the king not paying that respect to the grand

lama which he thought due to him, the latter called in the assistance of the Tartars, who took the king prisoner, put him to death, and established the grand lama in his stead. A few years after this, one Raptan, an experienced commander, resenting the fate of his royal master, commenced hostilities with the then lama, whom he declared an impostor, and in an engagement defeated and killed him. Elated at his success, and fully resolving to make the lamas subservient to the sovereign, he ravaged the whole country, demolished the pagodas, and banished all the lamas he could find. Raptan, however, was afterwards defeated in several engagements by the Chinese troops, and was at length obliged to retire, soon after which the tranquillity of Tibet was again restored, and it has continued on its original footing from that time to the present.

CHAP. XIX.

ASIATIC ISLANDS.

Of the Islands in the PACIFIC and INDIAN OCEANS.

1. The EMPIRE of JAPAN.

SECT. I.

Name, Extent, Divisions, &c.

THIS extensive and opulent empire is known to the Europeans by the general name of Japan; but the natives usually call it Nippon, which is the name of the most considerable island belonging to this sovereignty; and which appellation seems to have absorbed those appertaining to the other islands of the empire; but the vanity of the natives induces them sometimes to stile it Ten-ka, or *Under Heaven*, intimating, that it is the only country in the universe, so particularly favoured as to be placed directly under the celestial regions; on which account they frequently call the emperors Ten-ka-suna, or the *sovereign under heaven*; and indeed they imagine that sun, moon, stars, earth, seas, &c. were entirely formed upon their account, and for their accommodation only: such is the singular modesty of these Asiatic Islanders!

"Ask for whose use the heav'nly bodies shine,
Earth for whose form'd? Pride answers, 'Tis for mine!
"For me, kind nature wakes her genial pow'r,
Suckles each herb, and spreads out ev'ry flow'r;
"Annual for me, the grape, the rose, renew
The juice nectareous, and the balmy dew;
"For me, the mine a thousand treasures brings;
"For me, health gushes from a thousand springs;
"Seas rowl to waft me, suns to light me rise;
"My footstool earth, my canopy the skies."

In treating of Japan, some authors have thought proper to launch out rather too much, and enlarge upon many things hyperbolically; by which, instead of a genuine account of the place, they have furnished us with some mighty pretty romances; and several travellers, who have written concerning this empire, have unfortunately rather too much indulged that faculty so generally attributed to them, viz. not adhering closely to veracity, but trusting more to an inventive imagi-

nation than truth. A fancy fertile in fiction is certainly a very necessary qualification in a novel writer; but it is an unlucky circumstance when it haunts the historian or geographer. Therefore, faithfully to discharge the task we have undertaken, we shall not amuse our readers with any fabulous tales, but confine ourselves to facts only.

The empire of Japan, which consists of three large, and many lesser islands, is 130 deg. eastward of London, extending from 30 to 41. deg. north lat. and from 130 to 147 deg. east long. the whole cluster being about 600 leagues in circumference, and 200 in length.

The larger islands are Japan itself, Ximo the next in extent, and Xicoco the smaller of the three, which is situated between the former two. The less considerable islands, of various sizes, are scattered round those in an irregular manner.

The topographical division of the whole empire is into seven capital territories, five of which are in Japan, properly so called. Those territories were formerly divided into 62 provinces, and the latter subdivided into 604 districts.

Nippon, or Japan itself, extends from 33 deg. 10 min. to 41 deg. north lat. and from 130 deg. and an half, to 147 deg. and an half, east long. It is divided from the land of Jesso by the freights of Kamtschatka, being in length about 660 miles, and in breadth 400 where broadest; but the form is so exceedingly irregular that the exact circumference is difficult to be ascertained.

The grand security of this empire from foreign invasion are, the tempestuous seas and craggy rocks by which it is surrounded; indeed they seem so high and inaccessible, that when seen at sea, from a distance, the whole appears as one immense rock:

"—A rock that braves
The raging tempest, and the rising waves;
"Self prompt it seems to stand: its solid sides
"Keep off the sea-weeds, and the sounding tides,"

BY the situation of Japan rises with the Japanese
seventh climates, the sun rises with the Japanese
about eight hours before it does with us. The sea
breezes greatly mitigate the heat in summer, but they
add to the excessive coldness in winter, and render the
seasons here more inconstant than in any other parts of
the Indies. Heavy rains sometimes continue almost the
year throughout; but in the months of June and July,
which are called the water-months, they are always
excessive. The country is likewise frequently visited
with dreadful storms and hurricanes, thunder, lightening,
&c. by which the natives sustain great damage.
The soil is rocky, and rather sterile; but the industry
of the inhabitants hath overcome the unkindness of na-
ture, and given fertility to a land of itself unfertile.
They have rice, of which they make bread, and brew
beer; with the barley they feed cattle, convert their fine
wheat into cakes, and of two species of beans, they grind
one to meal to boil for eating, and with the other make
a kind of confectionary. They have besides Indian wheat,
millet, and many other sorts of grain. Even the rocks,
and other barren places, have been so well cultivated,
as to produce abundance of fruits and plants. They
have good pasturage, which feeds great numbers of buf-
faloes, oxen, sheep, horses, deer, &c. and various
flowers and herbs, particularly excellent tea. The en-
circling seas, intersecting rivers, and interior lakes, ab-
ound in fish.

The rivers are in general exceedingly rapid, and many
dreadful cataracts fall from the mountains. The princi-
pal rivers are the Ujingawa, whose waters are so furious,
that no bridge can be built over it; the Corric, that
takes its name from the province in which it rises; and
the Askagawa, remarkable for its depth and perpetual
fluctuation. The chief lake, called Citz, is 100 miles in
length, and 20 in breadth. It is formed by the conflux
of several rivers, and disembogues itself into the sea on
the south-west side of the island.

Besides the beforementioned animals, they have a fine
breed of horses that are small, but uncommonly swift,
and extremely beautiful. Many wild beasts that yield a
great number of valuable furs, and elephants, whose
teeth are a very profitable article to them.

Their seas produce red and white coral, ambergris,
admirable pearls, and many curious shells, sea-weeds,
&c. but the greatest wealth of the empire results from
its invaluable mines, particularly those of gold. The
emperor claims an exclusive right to all the gold and
silver mines, as well as all the gold sand in his domi-
nions. The copper mines are innumerable, producing
a fine and coarse fort. The bowels of their mountains
are likewise pregnant with sulphur, iron, and steel.
They, however, have not any quicksilver, antimony,
sal ammoniac, calamy, cinnabar, or borax.

Salt they procure by inclosing portions of ground near
the sea, covering them with fine sand, and repeatedly
throwing sea-water upon the sand, till it is well im-
pregnated with the saline particles: it is then placed in
large vessels, with holes in the bottom, for the salt to
fall into proper receivers, as it filters through the sand;
after which it is boiled, and brought to a proper con-
sistency as with us.

The sulphur every where inclosed in the bowels of
the earth is supposed to be the cause of the frequent
earthquakes, and of the volcanos, of which there are
eight very dreadful ones in the empire. From the same
cause their hot baths, and mineral springs, which are
extremely numerous, may be deduced; some equal the
heat of boiling water, and others are even as hot as boil-
ing oil. They have likewise many cold mineral springs,
but their physicians are so ignorant, as to be incapable of
advising them to the proper use of either.

In Japan are found a species of white ants, which
are exceedingly beautiful, but very mischievous; for
they pierce, with their little snouts, through every thing
they come near, except metal and stone, and greatly
damage all kinds of goods, if not prevented from ap-

proaching them, by strewing the adjacent places with
salt, which these little insects abhor.

The ducks of Japan are some of the finest in the
universe, for size, shape, and beauty. The nightin-
gales are likewise the most melodious to be found. The
beetles make an agreeable kind of humming noise, which
gradually rises to a pretty high note. The night-fly,
however, exceeds all other Japanese insects for its
beauty; the body is about three inches long, round,
and finely shaped: it has four wings, viz. two close to the
body, which make a brilliant appearance, by means of
the admirable blue and gold streaks with which they are
tinged; and two above these, whose transparency not
only admits of the others being seen through them, but
even adds to their shining lustre. This insect is a
mighty favourite with the ladies, and has given rise to
the best fable ever written by any of the Japanese poets;
with a translation of which we shall here present our
readers.

A JAPANESE FABLE.

A Nippon youth sat in a shady grove,
And thus bewail'd his unsuccessful love:
Like the night-fly, my cruel fair, I find,
Alike she's lovely, and alike unkind.
Insect! 'tis thou hast my destruction wrought;
By studying thee her cruelty the caught:
In thee, like her, I various charms survey;
Describing thee, her faults I can display.

Nothing in symmetry excels thy frame;
Thy head is coral, and thine eyes are flame;
Transparent wings the blue beneath unfold,
And give a polish to the streaky gold:
But such attractions how do you employ?
You charm to kill, and please but to destroy;
Then, your most faithful lovers to remove,
Pretend that their sincerity you'll prove,
And tell them, if their passion they'd reveal,
The spiny flames from tapers they must steal:
The hapless moths, to prove their love, aspire,
Singe their silk wings, and in the flame expire.

Their fate is mine—I ev'ry shape assume,
And aim to please with presents and perfume;
But meet disdain, and in her frowns consume;
Like the poor silly moths, obey to burn,
And in my passion find my fun'ral urn.

Near the hot springs a great number of camphire
trees grow, which resemble laurels, and bear purple,
or black berries. The cedars of Japan are some of the
finest in the universe; and many other trees abound in
those islands, particularly plantanes, &c. and some which,
when fawn or cut asunder, exhibit admirable figures of
birds, beasts, landscapes, &c. Of these many curious
pieces of furniture are made, which, when polished,
have a most beautiful effect.

Among many useful stones of various colours, there
is in this empire abundance of excellent marble, which
is used in the construction of many of the principal edi-
fices. The porcelain earth, &c. we shall describe here-
after, and only inform our readers, that, with respect
to other articles in the animal, vegetable, and mineral
systems not mentioned above, Japan abounds in most
that have already been described in China.

S E C T. III.

*Persons, Habits, Manners, Customs, natural and acquired
Accomplishments, Learning, &c.*

THE great disparity between the persons, manners,
and dispositions of the Japanese, evinces that they
are the descendants of different nations; and that the
empire of Japan was peopled at various times, by the
emigrations from, and revolutions of, several countries,
and the accidental shipwrecks of people, who were na-
tives of regions unconnected with each other: hence
no general description can be given of the inhabitants;
we shall, however, particularly describe the persons and
manners of the majority, in which the greatest simi-
larity is perceivable, as such a picture may be termed the
prevailing characteristic.

The

The generality then of the Japanese have but a forbidding appearance; a very flat nose, and eye-lids disgustingly thick, disfigure a face unproportionably broad, and disagreeably tawny. Their stature is short, their bodies thick, and their legs clumsy. Many differ from this character, and resemble the Chinese, from whom it is imagined they are descendants; and some few, particularly among the better sort of people, and those of the northern provinces, are similar in their appearance to the Europeans.

The Japanese habits are a short jacket of silk next to the skin, and a long cotton gown over it. They wear no covering to their heads, but when they go abroad defend themselves from the excessive heat of the sun by means of umbrellas; and the appearance of the men is at once martial and effeminate, for by their sides they wear a broad sword, or dagger, and in their hand carry a fan. They are, in another particular, singularly inconsistent, muffling themselves up in cloaks when at home, and throwing them off when they go abroad. Unlike most other nations, white is their mourning dress, and black deemed the gayest apparel: the travelling dress, however, differs from the above; it consists of a very large hat made of bambo splinters, which totally defends the head from heat and wet; and a cloak made of oiled paper, sufficiently large to cover man and horse, which are both so exceedingly light, that their weight is scarcely felt: ribbons wrapped round their legs, instead of stockings; and wide drawers, with slits on each side to receive the extremities of their gowns, complete the whole. None manage or direct their own horse, for none ride but such as can have a person to lead him. Not therefore having the bridle to mind, a Japanese traveller amuses himself with finging, fanning himself, or perusing the subjects painted upon his fan, which usually are a map of the country, description of the road, account of the inns, number of miles from stage to stage, price of accommodation at each, &c.

The bright side of the general character of a Japanese is diametrically opposite to that of a Chinese: he is modest, patient, no ways avaricious, temperate, a stranger to envy or defamation, and strictly honest in all his dealings: his deportment is grave, his words laconic, and his behaviour affable; gluttony and drunkenness are to him unknown; he despises idle ceremony, and is sincere in what he speaks.

The dark side of the character of a Japanese is filled with very black lines, and some of his vices seem inconsistent with the virtues ascribed to him; but travellers in general, and the observers of human nature in particular, know, from experience, that in the characteristics of every country there are incoherencies: the most authentic authorities represent a Japanese as being cruel to an excess, ambitious, proud, uncharitable, and possessed of so little feeling, that he will suffer a fellow-creature to perish, sooner than give him any relief, though what he gave could not be the least inconvenience to himself; and so exceedingly revengeful, that if he is disappointed in gratifying his resentment against another, he will destroy himself. In war they are ferocious and sanguinary, and when a town is taken, put all the inhabitants indiscriminately to the sword.

The Japanese are so quick of apprehension, that they make an amazing progress in whatever they are taught, and never forget what they once attain. Their common learning consists in reading, writing, understanding their own history, civil, military, and ecclesiastical; and a few simple precepts of morality; but many of them acquired several branches of the mathematics and philosophy from the European missionaries at various times, which their descendants still retain: their philosophy, however, is tinged with many superstitions of their own, and their astronomy blended with the absurdities of astrology. Prior to the arrival of the Europeans in their country, they were so ignorant with respect to geography, that they imagined their own empire, China, and Siam, to be the only countries in the universe; and even of the situation and extent of these, their notions were extremely imperfect: they have, however, many universities, and public academies, for the training up of youth in the learning of the country,

and the practice of the moral duties. These seminaries are well supplied with books, and resorted to by a great number of students, governed by bonzas, who are usually of noble descent, and well endowed with money for their support. According to the Portuguese missionaries, these superiors of the public seats of learning are adepts in moral philosophy, and great masters of the most persuasive elocution.

They have no regular system of physic; their doctors trust to experience, and always prescribe according to precedent, if they have a precedent to go by; but where that is wanting, they proceed entirely by conjecture; so that similar cases, and guess-work, form the whole of their materia medica: but the most fashionable remedies, upon all occasions, are hot and cold baths. The surgeons are more unskilful than the physicians in every thing except the cure of the feuki, a most grievous kind of cholera peculiar to the Japanese, which they almost instantly expel, by taking blood from the part afflicted, with a small needle made of gold or silver: both physicians and surgeons are, however, highly esteemed by the people, and usually acquire considerable fortunes by their practice.

The Japanese poetry is lofty, sublime, melodious, and descriptive; their music is less agreeable, but their paintings are the best executed by any of the Orientals, though they fall far short of the Europeans in every essential except colouring, in which they exceed them.

They lay claim to the invention of gunpowder and printing, as well as the Chinese: in the preparation and use of the first, they are much inferior to them; but they exceed them in the latter, which is performed in a similar manner, as well as in the composition of ink and paper.

They write like the Chinese from top to bottom in columns, which they begin at the right hand; and their letters were originally the same, but they have changed the form, and even the sound, of many, in order to differ as much as possible from the Chinese, whom they naturally hate, and affect upon all occasions to despise.

They educate their children with great care, and win them to a love of their studies by motives of emulation, and the most captivating endearments. They differ from all the other oriental nations in inculcating a contempt of pain and death, teaching them to despise all kinds of luxuries, weaning them from every thing that in the least tends to effeminacy, and inuring them to every kind of hardship.

Their mechanics and manufacturers excel in their different branches, and are even far superior to the ingenious Chinese. Their silks and cottons are excellent, and their Japan ware and porcelain unequalled; but great restrictions are laid upon their trade, the Dutch being the only Europeans who are permitted to enjoy it; and even when their ships arrive, they are obliged to land their great guns, and all their other weapons, sails, tackling, &c. which are carefully deposited in warehouses, till they have the emperor's permission to depart, when all is again returned, and they are under an obligation to sail away immediately; and the natives themselves are not allowed to trade, by the means of their shipping, to any places but China, Korea, and the land of Jesso. The swarms of pirates in their sea add to the obstacles that obstruct their commerce.

The commodities exported are wrought silk and cotton, rice, Japan ware, porcelain, gold, silver, copper, iron, steel, artificial metals, furs, tea, finer and better cured than that of China; gums, medicinal herbs, roots, &c. diamonds, pearls, coral, shells, ambergris, &c. The Dutch factory is situated on a rock, called Disima, near the city of Nanguwzak, from which it is separated by a wall and a river; and out of this little island, which is only two miles in circumference, none of the Dutch are permitted to stir. This restraint the people of the factory always suffer, and the merchants and sailors are compelled to endure it during their continuance in Japan, which usually lasts about nine months.

The Japanese, for whatever goods they want, pay either by way of barter with other commodities, or in bullion of gold, silver, or copper. Their ships, which resemble those of the Chinese, are built of cedar

wood,

wood, but are only fit for very short voyages; they are built from 80 to 90 feet in length, and from 20 to 25 in breadth, and constructed both for sailing and rowing: they contain many little cabins, separated by screens, folding-doors, &c. They have only one mast, and one sail; the ropes are made of rice straw, and the anchors of coarse iron. The Japanese pleasure boats, which are intended only for the navigation of lakes, rivers, &c. are extremely beautiful, being finely gilt, carved, and otherwise adorned with the most curious and superb embellishments.

For domestic purposes the Japanese coin various pieces of money. The gold coins are obans and cobans; ten cobans make one oban, which latter is of about two guineas value. The silver coin is composed of a variety of flat pieces of different shapes, dimensions, weight, and value; and a copper coin is stamped for the inferior purposes of change.

The public edifices of Japan resemble those of China in their architecture and magnificence; but the private buildings, though erected upon the same model, exceed them in neatness, simplicity, and convenience.

The furniture is plain and useful; the floor, or rather pavement, is only covered with mats; though it must be allowed that the houses of the nobles are elegantly decorated; almost every house has a garden, in which much industry, and some taste, are displayed; and the apartments of most houses are divided by moveable wainscots or screens, which may be taken away at pleasure, and many apartments thrown into one upon any particular occasion. The screens, couches, beds, tables, cabinets, &c. of the grandes, are all made of the best materials, admirably wrought, and highly finished: they are, however, less gaudy than neat, and less superb than elegant; but their ceilings are exceedingly magnificent, being made of the best cedar, admirably carved and gilt, and inlaid in a most ingenious manner with gold and silver plates.

The coaches, equipages, and dresses of those who attend on the emperor, are very grand; though most of the coaches are clove, particularly those appropriated to the use of the women.

When the Japanese salute, they stand erect, unless it is before the emperor, or some great lord, when they prostrate themselves. If a person salutes them, they sit down, instead of returning it. Thus, by trying to avoid the stiff formality, and tedious ceremonials of the Chinese, they frequently run into extremes as disagreeably absurd:

- "Extremes, though contrary, have the like effects:
- "Extreme heat mortifies like extreme cold:
- "Extreme love breeds satiety, as well
- "As extreme hatred; and too violent rigour
- "Tempts chastity as much as too much licence."

They black their teeth and nails, and let the latter grow very long.

The Japanese are temperate in eating and drinking, seldom touch the flesh of any animal, unless it is killed in hunting; are equally abstemious with respect to fowls, and even fish; their chief food being rice, herbs, pulse, fruit, &c. They are neat in dressing their food, sit cross-legged to eat it, and make use of little sticks instead of knives and forks. They drink warm water at their meals, but after dinner and supper, they indulge themselves with a dish of tea.

At the time of any public festival, they are entertained with music, dancing, plays, and masquerades. Their dramatic pieces are neither so correct or elegant as those of the Europeans, yet they are not without their merits.

The marriage ceremony of the Japanese is celebrated by the bonza, or priest, before some idol. It is with them as with us, the rich go in coaches to be married, but the poor are obliged to trudge it on foot. The bride and bridegroom having a lighted torch, or a lamp, put into their hands, the priest performs the ceremony; when the bride, to evince that she is determined to commence a woman, burns her dolls, and all the trinkets and toys of her childhood; the company

then congratulate her on her marriage, and make her a variety of presents to recompence her for those she hath destroyed. The rejoicings continue seven days, during which every thing is done to promote mirth and festivity, and at the close of that time the bride is conducted with great ceremony to her private apartment.

They pay an annual visit to the tombs of their ancestors; at which time, when the company have arrived at the sepulchres of the dead, the bonzas describe the situation of the persons deceased, and inform their relations of all they have occasion for in the other life, which demands are usually very extravagant; the kindred, however, furnish every article with great satisfaction, which they send, together with a few kind and complimentary messages, to the deceased, by means of the bonzas, who convert the whole to their own use, and leave the dead to shift for themselves as well as they can.

The pages and dependants who attend upon the grandes, engage themselves by a most solemn oath not to outlive their lords, but upon their decease, to put themselves to a voluntary death; which oath they are never known to break. The funerals in general, but particularly those of the nobles, are conducted with great pomp and solemnity, and no manner of expence is spared; as it is a prevailing opinion among the Japanese, that the greater the expence of a funeral, the happier the deceased will be in the other life.

The corpse of a principal person is dressed in the most superb apparel, and placed upon a litter made of cedar, in the ornaments of which the most exquisite workmanship is displayed; the women are carried in clove coaches, or sedans, and the men, elegantly dressed in white garments, walk on foot. Many bonzas follow, some singing, some playing upon musical instruments, and others carrying the banners of the deceased. The rear is brought up by the domestics of the family, who, like the rest of the mourners, are clad in white. On arriving at the funeral pile, which is built of the most sweet scented woods that can be procured, and the fragrant of it heightened by the addition of spices, gums, oils, and other perfumes, or odoriferous materials, the corpse is laid upon it. An oration suitable to the occasion is spoken, stanzas are sung, and then fire is put to the pile in several places at once; a variety of cloaths, wines, flowers, sweet herbs, pieces of money, victuals, &c. are then thrown in by the relations and friends, as presents to the deceased for his particular use in the other world. The whole then concludes with a banquet, and an entertainment of such music as is best calculated to banish melancholy ideas.

Secluded as Japan is from the rest of the world, and little as the origin or ancient connections of the inhabitants are known, their ceremonies bear a pretty strong resemblance to those formerly used by the Grecians and Romans. The supposition of the former, that an expensive burial is of service to the circumstances of the deceased in the other world, exactly coincides with the sentiments which the latter entertained.

- "Mean time: the rites and funeral pomps prepare,
- "Due to your dead companions of the war;
- "The last respect the living can bestow,
- "To shield their shadows from contempt below."

VIRGIL.

With respect to presents for the use of the dead, their notions appear to have been pretty similar.

- "Then twice around the kindled piles they go;
- "Thrice horse and foot about the piles are led,
- "And thrice with loud laments they hail the dead;
- "Tears trickling down their breasts bedew the ground,
- "And drums and trumpets mix their mournful sound;
- "Amidst the blaze their pious brethren throw
- "The spoils in battle taken from the foe;
- "Helms, bits embos'd, and swords of shining steel;
- "One casts a target, one a chariot wheel;
- "Some to their fellows their own arms restore,
- "The falchions which in juckles fight they bore;

3 C

"Their

" Their bucklers pierc'd, their darts below'd in vain,
 " And shiver'd lances gather'd from the plain ;
 " Whole herds of offer'd bulls about the fire,
 " And bristled boars and woolly sheep expire."

VIRGIL.

The bonzas or Japanese priests are not only the chief mourners and officiating persons upon these occasions, but the undertakers likewise, as they furnish every thing but the presents, and order the ceremonials of the whole affair.

The ensuing day, the nearest relations gather up the bones and ashes of the deceased, put them into a rich funeral urn, and deposit them in the sepulchres of their ancestors. This is likewise agreeable to the Grecian and Roman Custom.

" And last, the relics by themselves dispose,
 " Which in a brazen urn the priests inclose."

The sepulchres are at a distance from the towns, surrounded by an inclosure, and planted with trees, which give them a very agreeable appearance.

The Japanese in general are healthy ; many, however, are troubled with the leprosy, a disorder equally dreadful and nauseous ; and those who are infected with it are obliged to live in some solitary place, secluded from society, where they remain without assistance or compassion, till death puts an end to their miserable existence. The small-pox, and bloody flux, are disorders known here, but not much dreaded. But they are totally unacquainted with the stone and gravel, gout, rheumatism, &c.

SECT. IV.

Government, Revenue, civil, military, and ecclesiastical Establishments, &c.

JAPAN is under a monarchical government, and despotic administration ; it was formerly divided into many petty sovereignties, the princes of which are at present either immediately dependent on, or tributary to the emperor of Japan, and may be deposed, or even put to death at his pleasure. They are near sixty in number ; and it is the grand policy of the emperor's court to encourage dissensions between them, to engage them in perpetual wars against each other ; that by keeping them in continual alarms, and weakening them frequently, they may the more effectually secure their subjection ; and neither give them opportunity to unite, or permit them to acquire strength sufficient to become independent.

The emperors were formerly at the head of religious as well as civil and military matters ; and under the title of Dairo, were the pontiffs as well as sovereigns of Japan ; at which time they were held so sacred, on account of the ecclesiastical being blended with the regal authority, that a defection in any of their subjects was deemed as a rebellion against Heaven itself. They were perfectly adored ; but the absurd dignity which they affected, and state in which they passed their time, rendered their lives none of the most desirable ; they were closely confined, as it was deemed derogatory to their consequence to suffer the sun to shine, or the wind to blow upon them ; thus through a ridiculous parade of importance, were they at once deprived of three of the greatest blessings of Providence, viz. liberty, light, and fresh air. Many other marks of his grandeur were equally disagreeable, and even disgusting ; they were never suffered to put their feet to the ground, to wear the same cloaths, eat out of the same utensils, or lie in the same beds twice ; nor were they permitted to have their hair cut, their beards shaved, or their nails pared. Their titles and the manner of approaching them were equally absurd, the first bordering on blasphemy, and the latter on idolatry. Thus confined to a solitary effeminacy and luxurious inactivity, the administration of public affairs was delegated to the prime minister, who was styled Cubo ; and it was one of the Cubos that stripped the Dairo of having any concern in the civil and military authority. So that the cubo at present may be deemed the emperor, as he hath all the power ; and the

dairo, the high priest or pontiff, as he still possesses all the ecclesiastical dignity. The cubo goes once in five years in grand procession to the city of Meaco, to do homage to the dairo, and acknowledges himself his deputy ; this ceremony, however, is a mere piece of superstition, and only calculated to prevent an insurrection in favour of the dairo, who is still highly revered by the common people.

The administration at present is composed of a council, in which the emperor presides, four ministers selected from the principal nobility, and twenty-eight assistant counsellors, four of whom are tributary princes, who come to the city of Jeddo, and attend by rotation. And not only these, but all the other dependant kings are obliged to attend upon the emperor six months annually. The governors and nobles must be in waiting a limited time, and the eldest sons of all the tributary princes, governors, grandees, nobles, &c. must be educated at court, and remain there during pleasure, by which means, the submission and fidelity of all the principal people in the empire is secured either by their own presence, or the hostages they leave behind them. In critical times, an oath of fidelity is administered, and the wives and younger children are obliged to reside in Jeddo, till any storm which is thought to be impending is blown over.

As industry is the best preservative from mischievous thoughts, 100,000 of the common people are constantly employed in public works : to these precautions we may add, that numerous garrisons are dispersed throughout the empire ; all cities and towns are divided into wards, separated from each other by gates, which are shut and guarded every night.

From what is said above, it may easily be inferred that the emperor's security is great, and his court numerous, and that what adds to his safety, contributes to his grandeur. His army, garrisons included, consist of 100,000 foot, and 20,000 horse. This is the peace establishment, but in the time of war, the tributary princes are obliged to join the royal standard with such a number of troops, as increases the first to 368,000, and the latter to 38,000 men. The cavalry wear armour, but the infantry have not any thing defensive but helmets.

The Japanese troops march in divisions of 50 men in each, five in front, and ten deep, each division being commanded by a single officer, who keeps them in exact order. They are armed with either muskets, pikes, bows and arrows, sabres and targets, or battle axes. Five of these divisions form a kind of regiment ; but they are not accompanied by any warlike music ; between each division are three led horses finely caparisoned, and three slaves are appointed to lead each horse with long reins. The captains ride on horseback behind their respective divisions, on each side of the horses are a kind of panniers, containing the officer's bedding and baggage. When an officer grows old, he is permitted to have a small sort of couch or supporter behind him, against which he may commodiously lean when fatigued by sitting upright.

The revenues of the emperor are certainly very great, some authors affirm that they amount to 28,000,000l. sterling, but the truth of such assertions is greatly to be doubted.

Their laws are exceeding severe, and their punishments sanguinary ; the first have little or no mixture of lenity, and the latter are more than adequate to the crime. They have no code of statutes, the emperor's will being the grand law, and the inclinations of the subordinate princes and governors final in their own kingdoms and provinces ; even every petty lord, or the master of a family, have a power over the lives of their vassals and relations. The smallest crimes are punished with death ; and the only indulgence shown is to any of the tributary kings when they offend, and this is no more than allowing them to execute themselves, which is deemed a mighty favour. The mildest sentence in Japan is banishment to a dreary and almost barren island, surrounded by rocks, and destitute of almost every comfort of life. High treason, and other crimes of an atrocious nature, which concern the emperor's safety or interest,

the still posses-
sion of Meaco, to do

are not only punished in the person of the criminal, but his parents, children, and all his relations are put to death on the same day, let them be at ever so great a distance, expresses being sent for that purpose to the different governors. With respect to other crimes, the male relations only are put to death, and the females sold as slaves.

The modes of punishment are these, viz. crucifixion with the head downwards, burning, boiling in oil, tearing to pieces by wild horses, cutting to pieces by the executioner, beheading, hanging, &c. If the criminal escapes, he is executed in effigy; but his unfortunate relations are punished in reality for crimes, of which, perhaps, they never had the least conception.

- "When sanguinary laws are strain'd too high,
- "The hapless guiltless for the guilty die;
- "And greater crimes the legislators cause,
- "Than the poor culprit who infrin'd the laws."

The worship of the Japanese is the grossest idolatry; they think that the world existed from eternity, and that the idols they worship were originally men, who for their exemplary piety, at length were transformed into deities. They are divided into several sects, the principal of which are, 1. The Xinto, or those who worship only the ancient idols. 2. The Siutto, or those who admit of no ceremonies whatever in religion. 3. The Budzo, or those who have introduced many Chinese, Siamese, and other exotic idols. These are subdivided into many other classes, by whom fun, moon, stars, almost every visible object, and even the devil himself is worshipped.

The chief idols belonging to Xinto's sect, are Amida and Xaca; Amida they imagine flourished many thousand years since, and having done many penances, preached many sermons, and performed many miracles, grew tired of life, and put an end to his own existence, when he was about 2000 years of age. Xaca they think lived 8000 years ago, past much such a life as the former, and when he was about 3000 years of age, immured himself in a cave, the mouth of which he caused to be closed up.

Their next idol is Cambodoxi, who they say is only of 900 years standing; he it seems was a great astrologer, and shut himself up alive in a tomb, which he had caused to be erected, promising to come to his followers again; we do not, however, hear that he ever kept his promise by paying them a visit.

Such hath been the superstition of many ages and countries, absurdly to give to the creature what is due alone to the Creator, and to canonize those who were so sufficiently artful in their designs, or singular in their whims as to impose on the weak.

- "Who first taught souls, enslav'd, and realms undone,
- "Th' enormous faith of many made for one;
- "That proud exception to all nature's laws,
- "To invert the world, and counter-work its cause:
- "Force first made conquest, and that conquest law,
- "Till superstition taught the tyrant awe;
- "Then shar'd the tyranny, then lent it aid,
- "And gods of conquerors, slaves of subjects made;
- "She from the rending earth, and bursting skies,
- "Saw gods descend, and fiends infernal rise:
- "Gods partial, changeful, passionate, unjust,
- "Whose attributes was rage, revenge, or lust;
- "Such as the souls of cowards might conceive,
- "And form'd like tyrants, tyrants wou'd believe."

Temples in Japan are innumerable, and the number of monasteries are scarcely credible. The monks are either regulars or seculars. The regulars reside in convents, some of which contain a thousand monks or upwards; the seculars are dispersed about and live in private houses. The former are exceedingly abstemious, but the latter live in luxury and idleness.

Some of the temples are extraordinary for their extent and magnificence, particularly one near Meaco, which contains 33,333 idols. The temple of Cano, the son of Amida, contains 1000 images, 500 on each side,

the workmanship of which is exquisite. The temple of Meaco, which is as big as the church of St. Paul, London, contains the largest idol in the Japanese empire. The chair upon which it sits, according to Sir Thomas Herbert, is 70 feet high, and 80 broad. The festivals are as numerous as the deities; and as the number of the latter are so great, many of the former are daily celebrated in different parts of the empire; the number of festivals greatly exceeding the number of days in the year, and various ceremonies are used upon these occasions, according to the antiquity, dignity and reputation of the idol whom they intend to honour.

It may not be improper here, to subjoin an account of the introduction, success, continuation in, and extermination of, Christianity from Japan.

The Portuguese jesuits introduced Christianity into Japan about the year 1552; their skill in the mathematical sciences being their recommendation to the emperor, nobility and literati. They gained many proselytes among the lower orders of the people, who were won by the mild precepts of a religion so different from their own, which abounded in the most bloody tenets; and captivated by the innumerable charities of the missionaries to the poor, blind, lame, and diseased of all denominations, whom their own priests represented as marked out by the vengeance of the gods, and afflicted by means of their anger. Many of the petty kings, and of the nobility, likewise became proselytes; but these the missionaries represent as hypocrites, who embraced the Christian faith merely through interested motives, that is, either to monopolize the commerce of the Portuguese, or to learn those arts and sciences in which the jesuits were capable of instructing them. The missionaries had great success till 1616, when being accused of having formed a plot to dethrone the emperor, and subvert the government, great jealousies subsisted till 1622, when a dreadful persecution ensued, not only of the Christian foreigners, but of the native proselytes. Christianity was totally extirpated, and none are since permitted to profess the Christian tenets, under pain of death; nor is a stranger suffered to land in any part of the empire, unless he first publicly renounces them.

S E C T. V.

A Description of the chief Cities of Japan, and of the magnificent March of the Cubo, to pay Homage to the Dairo.

MEACO, or Miaco, is situated in the province of Jamatto, in 45 deg. 38 min. north lat. and 138 deg. 15 min. east long. being 276 miles west of Jeddo, and was the ancient metropolis of the whole empire, as it is at present the residence of the dairo. It is built in a pleasant and extensive plain, on the southern coast of the island of Japan, being surrounded at some distance by mountains, which give a delightful and romantic prospect to the whole.

The circumjacent country between the city and the mountains, and the mountains themselves are covered with temples, sepulchres and monasteries, and embellished with a variety of orchards, gardens, groves, cascades, and purling streams.

- "The various leaves on every bough are seen,
- "Some ruddy colour'd, some of lighter green;
- "The painted birds, companions of the spring,
- "Hopping from spray to spray are heard to sing;
- "Both ears and eyes receive a like delight,
- "Enchanting music, and a charming sight."

Three considerable rivers likewise water this fertile plain, and unite their streams in the center of the city, where a magnificent stone bridge facilitates the communication between the upper and lower town.

In the north part of the upper town the dairo has his palace. And on the western side is a strong castle, which serves as a palace for the cubo, when he comes to pay homage. It contains a small garrison, is 600 yards in length, has a tower in the center, and is surrounded by two ditches, the one dry, the other full of water, and abounding with the most delicious fish.

This city has greatly declined since the emperor's court

has discontinued to reside here; it was then 20 miles in length, nine in breadth, exclusive of the suburbs, and surrounded by strong and stately walls. The streets were long and narrow, and exceedingly crowded with inhabitants; for on a list being given in by order of government, the number amounted to 529,726, though the dairo's court, and strangers not constantly residing in the place, were not included. But according to the best authorities, it does not at present contain above one hundred thousand souls. The universities, colleges, monasteries, temples, are almost incredible in number, and magnificent in appearance; the following list is said to be genuine, by writers of the greatest veracity:

Temples of the Buddho sect	3893
Do. of the Suito sect	2127
Number of palaces	157
Do. streets	1858
Do. bridges	87
Do. houses	138,979

Though the public buildings are magnificent, the private houses are but two stories high, built of wood, and covered with clay, or thatched. Every house is obliged to have a reservoir, or trough of water always ready in case of fire. They however join neatness with their simplicity; and every trade or calling hath its particular street or district.

The dairo's palace may be deemed a city of itself. It is inclosed by magnificent walls, flanked with stately towers, and surrounded with a double ditch. It contains twelve capital streets, in the center of which are the royal apartments, superbly built, elegantly furnished, and adorned with gardens, orchards, pavilions, terraces, groves, &c.

The city of Jeddo, or Yeddo, the residence of the cubo of Japan, or acting emperor, is in 35 deg. 48 min. north lat. and 144 deg. 10 min. east long. and stands in the midst of a fine plain in the province of Musasi. It is at present the most important city in the Japanese dominions with respect to commerce, opulence, extent, and number of inhabitants. It is in the form of a crescent, and exceeds Meaco both in circumference and population. It is intersected in almost every street by canals of water, whose banks are planted with rows of trees. These canals not only serve as ornaments to the city, but are of singular utility in cases of fire, as they both afford a ready supply, and stop the progress of the conflagration. The city is not surrounded by walls, but has a strong castle to defend it; the river Tonkag waters it, supplies the castle ditch, and being divided into five streams, has a bridge over each. The principal of these bridges, named Nipponbar, is the standard from which all the roads, posts and distances in the empire are taken. The tributary princes who attend on the emperor, are obliged to reside here with their whole retinues all the year round. The streets are wide and handsome, but more irregular than those of Meaco. The public buildings are magnificent, but the private dwellings are as mean, and at the same time as neat as those of the before mentioned city.

The imperial palace is a most noble building, formed by three cincluras, or circular piles of buildings, and inclosing many streets, courts, apartments, pavilions, guard houses, gates, draw-bridges, gardens, canals, &c. &c. In it resides the emperor and his family, the royal domestics, tributary princes, and their retinues, the ministers of state, many officers, and a strong garrison. The walls are built of free stones, which are not cemented by mortar, or braced together with iron, but being prodigiously large, are laid loose upon each other; which is a precaution taken, that they may not receive any considerable injury from the earthquakes which are so frequent. The whole pile of buildings is covered with gilt tiles, so that at a distance it makes a most splendid appearance, and seems to be a huge mountain of gold. Many of the stately apartments are formed, and altered at pleasure, by means of magnificent screens, and superb moveable partitions. The principal apartments are, the *hall of attendance*, where the emperor gives audience. The *council chamber*, where the ministers of state meet. The *hall of a thousand mats*, where the tributary

princes do homage, &c. This palace was built so late as the year 1600, in the reign of the emperor Tayko.

This city is under the direction of two governors, who rule a year each alternately; under these are inferior officers like our aldermen, who have the direction of particular districts or wards; and subordinate to these are the *ottonas*, who have each the care of a particular street.

Next to the above two, the most considerable city in Japan, is Ofacca, which is situated on the mouth of the river Jedogawa, about 15 leagues from Meaco, and in 35 deg. 15 min. north lat. and 137 deg. 20 min. east long. it is deemed the principal sea port in the empire, and is filled with an incredible number of merchants, tradesmen, mechanics, ecclesiastics, &c. Indeed, it is so populous, that an army of 80,000 men has been drawn from it upon emergencies. It is near 15 miles in circumference, contains many elegant houses, and some palaces belonging to the nobility. A strong quadrangular castle defends the port. The walls are thick, the towers with which they are flanked, well fortified, and the garrison numerous. Two officers command here, one has the superintendence of the castle and the emperor's treasures, stores, and customs; the other presides over the garrison; but the city itself hath a governor of its own, who has the regulation of all civil affairs. The houses in this city are covered with a kind of earth of a yellow colour, which gives their roofs an elegant appearance, and great quantities of this earth are transported to other parts of the empire. In this city, the watchmen make the hour known by means of three instruments. An hour after sunset, they beat a drum, the succeeding hour is signified by striking on a brazen bowl, and the hour subsequent to that by ringing a bell; the next hour they begin again with the drum, proceed to the bowl and bell, and so continue the whole night, using the three instruments alternately. In all other parts of the empire, however, the hour of the night is told by beating with two wooden cylinders against each other.

The city of Surunga, in 35 deg. 22 min. north lat. and 142 deg. 30 min. east long. is the capital of the province of the same name, and a very considerable seaport town; some of the emperor's once resided in it; and Captain Saris informs us, when he was there, that the English were permitted to trade with the merchants who lived chiefly in the suburbs. It is now greatly on the decline, but still retains some of its ancient privileges, particularly the liberty of coining money.

Saeaca, which stands about twenty miles from Ofacca, is inhabited by a proud set of people, who all boast of their ancestors, and pretend to be descended from the ancient Japanese emperors. This city is very advantageously situated as a place of strength, being defended on the different sides by a strong wall, an inaccessible mountain, a capacious ditch, and a formidable castle.

Near the harbour is a little island, called Pie-nez, celebrated for its pleasant groves, and famed as the residence of a favourite idol, to whose temple many of the inhabitants of the city repair in boats; and, some through an excess of zeal, jump into the water and drown themselves by the way.

The above are the principal places in the island of Nippon, or Japan. In the island of Ximo, the chief cities are,

Bungo, which though said to be the capital, is not particularly described by any author.

Cangoxima, a sea-port on the southern part of the island, was the first place where the Portuguese landed when they discovered Japan. It lies in 31 deg. 42 min. north lat. and 133 deg. 16 min. east long. a strong castle is built on a rock in the harbour, and a light-house on another very high rock in the harbour. A good garrison is kept here; and many stately temples adorn the city.

Nangazaki lies in north lat. 32 deg. 36 min. and in 131 deg. 22 min. east long. in the province of Tigen, and is the only place in the whole Japanese empire, where the Dutch are permitted to come. The city is in the form of a crescent, delightfully situated among verdant lawns, and surrounded by pleasant hills: it contains many handsome buildings, particularly temples, and

EMPIRE OF JAPAN.

197

and is strongly garrisoned, the streets in general are narrow and crooked, but run a considerable length, the temple or some public building usually terminating the vista; the town is watered by three rivers, and divided into upper and lower; the former containing 26, and the latter 61 streets; but strangers reside in the suburbs, and are narrowly watched. The principal buildings are five warehouses, in which are laid up all the materials for forming three men of war, which, upon an emergency, may be taken out, and put together in a very short time; a powder magazine, the palaces of the two governors, the palaces of between 20 and 35 grandees, 62 temples, 35 bridges, 20 being of stone, and the rest of timber, and the gokina or prison, which the people very emphatically stile Hell. It consists of about 100 dungeons or cages separate from each other, apartments for private executions, and baths in which the prisoners are obliged to wash themselves, in order, as much as possible, to prevent infections.

The it and of Xicoco is divided into four provinces: Ava is the capital of the island, but of that, as well as the other towns of the island, we have no particular description, at least none that can be depended on.

Besides the three great islands already mentioned, many others appertain to the Japanese empire; some few of which are inhabited, but most of them are mere deserts; of the first kind, the island of Firando is the most considerable; it extends from 33 deg. 20 min. to 34 deg. north lat. and from 131 to 132 deg. east long. The Dutch first fixed their factory here, built many elegant houses, and erected some extensive magazines; but the Japanese fancying that they designed the latter rather for forts than warehouses, they were, by order of the court, obliged to quit the island in 1640, and confine themselves to their factory at Nangazaki. The island contains nothing worth particular mention, except its castle, which is large, strong, and stately.

We shall now give a description of the grand march or procession of the cubo from Jeddo to Meaco to pay homage to the Dairo, the preparations for which usually take up a twelvemonth. The route between the two cities is divided into 28 stages, two of which the Cubo performs in a day, entering the first at noon and putting up at the other at night; hence the whole journey takes up a fortnight to complete it. At every stage the equipages and guards are changed, but the whole join in the procession, and follow the Cubo entirely to Meaco, so that the retinue is very considerably augmented daily.

His excellency Conrad Krammer, the Dutch ambassador, informs us, that in 1626, when he was in Japan, the Dairo and Cubo agreed to unite their numerous retinues, in order to render the scene more splendid and magnificent. The streets were strewn with a white glittering sand, which gave them a silver appearance, and on each side a ballustrade was erected and lined with a double file of soldiers, who were all clothed in white robes: they wore a scymetar on each side, a varnished cap on their heads, and a pike in their right hand.

At the dawn of day the superb cavalcade began, the domestics of each monarch went first carrying the respective presents in boxes admirably wrought, and elegantly varnished. These were followed by 100 magnificent sedans, containing the ladies and gentlemen of the Dairo's court, and each being carried by four men in white garments, a servant attending every one, and holding over it a beautiful umbrella of silk finely embroidered with gold: 24 gentlemen on horseback succeeded, their caps brown and varnished, and adorned with a black plume of feathers, their boots were gilt, their drawers of taffin, covered with gold and silver lace, and their arms were scymetars, bows, and arrows. The horses on which they rode were small, beautiful and high spirited, and richly caparisoned. The saddles being finely embroidered, and the holsters made of tygers skin, elegantly decorated with red silk and gold fringes. The horses had besides two gilt horns placed between their ears, and their manes curiously ornamented with gold and silver wires. Each horse was led by two men who held the bridle in one hand and a rich

umbrella in the other, and every one of these gentlemen was followed by eight servants, dressed in white, and armed with two scymetars each. The horses were shod upon this particular occasion with a kind of red silk, just strong enough to serve for the day: after these came three superb state coaches, each of which had two beautiful black bulls to draw it, every bull being covered with crimson silk, and led by four men. The coaches were of a shining brown, finely gilt, and embellished with the most admirable decorations; besides a door on each side, they had a door behind, embellished with festoons; the wheels were shod, and the spokes plated with gold elegantly enamelled; the bodies were square, but the roofs of a circular form; the insides were of a shining black varnish, painted with the arms of the Dairo: each coach contained one of the Dairo's wives, and a female attendant; and all three were strongly guarded by a great number of footmen. Behind each coach was a pair of steps plated with gold, to serve in lieu of a footboard, and the flippers of the lady, who was riding in it; 23 sedans followed filled with the ladies of honor; their chairs were made of a fine white wood, highly polished, and adorned with plates of copper elegantly wrought; they were each carried by four men in white, followed by two with umbrellas, and guarded by a numerous escort; then came 68 gentlemen on horseback, attended by a great number of footmen. These were followed by the principal grandees and ministers of state, carrying presents of inestimable value, and succeeded by 260 noblemen; then came the Cubo's brothers, and 164 tributary kings and governors, each attended by a suitable retinue: these were followed by two state coaches, richer and more magnificent than the former, the first containing the late emperor, Fude-tadda, who had abdicated the crown in favour of his son Toxogunfama, who followed his father in the other coach, both being guarded by 400 soldiers richly accoutred; after these came many other superb coaches and caravans, and 30 sedan chairs, made of ebony and ivory, richly embellished, covered by the most sumptuous umbrellas, escorted by many servants both horse and foot, and followed by a large band of musicians, who sung to the tune of their instruments. Then followed the Dairo's sedan, carried by 50 gentlemen richly apparelled, and preceded by 40 life guards; the chair itself was as magnificent as art and expence could make it. The inside represented a blue sky, embellished with the figures of the sun, moon, and planets, admirably formed with diamonds and other precious stones; perched on the summit of the outside appeared the figure of a cock, with expanded wings, made of massy gold; and the whole cavalcade was clothed by a numerous retinue clad in the most noble garments that art could furnish, of money procure.

S E C T. VI.

History of Japan.

THE Japanese annals of early times are filled with such inconsistent absurdities, and ridiculous fables, that no dependence can be placed on them, till about 660 years before Christ, which is their common era; and, according to which, our present year 1777 is with them the year 2437; it is likewise to be observed, that the Japanese year begins the nearest new moon, which either precedes or follows the 31st day of February.

The histories of Japan, written by the natives, take very little notice of the policy, virtues, vices, or transactions of their monarchs, but are filled with an account of their descent, names, birth, succession, length of reign, &c. The following chronicle is taken from their own historians.

1. Sin-mu, the founder of the Japanese monarchy, began his reign 660 years before Christ. In the 70th year of his reign he instituted a form of government, established laws, civilized the people, taught them chronology, and other arts and sciences; divided time into years, and years into months and days; secured the crown to his posterity; and having reigned 79 years, died in the 149th year of his age, and was succeeded by his third son; but as nothing particular happened in his

reign,

reign, or the reigns of several of his successors, we shall only give a catalogue of them till a remarkable reign requires a more ample account.

Order of succession.	Names.	Reigned years.	Died, aged.

Their ages not mentioned by the Japanese historians.

62 Murakami, in the year of Christ 947, and 1607 of the Japanese year, called together a synod of the clergy, to regulate all that related to the ecclesiastical establishment in Japan, and to prescribe the ceremonies of the modes of worship proper for every sect.

From the death of this monarch, till the reign of Kon-jei, 13 emperors are mentioned, in whose reigns nothing worth recording happened: they occupied the space of 174 years, and the last was succeeded by

76 Kon-jei; this monarch began his reign in the year 1142, and in his time was born the celebrated crown general, Jeritomo, who rendered himself sufficiently formidable to strip the Dairors of their secular power, and to install it upon his own family.

From this period a double chronology commences, including the reigns of the Dairors and of the Cubos.

The number of Dairors from Kon-jei to Kin-fen, is 38, who occupied a space of 545 years, that is, from the year of Christ 1142, to the year 1687, or from the Japanese year 1802 to 2347; after which period, the exclusion of all Christians from Japan, the Dutch excepted, and the total silence of the Dutch writers upon every subject but those which relate to trade, and emoluments accruing from their commercial affairs, render it impossible to say any thing farther of the Japanese history. And as the Dairors are totally excluded from society, the transactions of that period are not to be connected with their names, but should be recorded in the reigns of the Cubos, which are as follow:

	Reigned.		Reigned.

The ages of these princes the Japanese historians do not mention, and indeed they have been more remiss in this particular in the recent than the early reigns; perhaps the great length of the former rendered them more remarkable than the latter could be from their general brevity, but to proceed.

29. Tayche, this monarch was of a very mean extraction, but in his youth raised himself to be butler to a tributary prince, and by dint of valour and merit was at length exalted to the cuboship. He was the first monarch who obliged the petty kings and great lords to attend upon him personally, and suffer their wives and kindred to reside in his palace, as hostages for their fidelity; by which prudent policy, he struck at the very root of that rebellious spirit so common in Japan, and put an end to the possibility of raising insurrections. He expelled the Portuguese from Japan, prohibited their

ever after trading with his subjects, and began the first persecution against the Christians. He died on the 6th of December, A. D. 1598. After his decease he was deified, and called the *Second Mori of Japan*.

30. Quanbacondono, the nephew of Taycho, is accounted the 30th Cubo, as he reigned for some time in conjunction with his uncle; but having disobliged that monarch, he was ordered to rip up his own bowels, the most honourable method of suffering death in Japan.

31. Fide-Jori, the son of Taycho, began his reign at six years of age; during his minority, the affairs of government were conducted by his father-in-law Ijejas, for Fide-Jori had been contracted in his infancy to a daughter of that nobleman, who traitorously deprived him of his crown and life, after a reign of 14 years.

32. Ijejas-Samma, having usurped the throne, made the following articles the principal objects of his reign.

1. The total extirpation of the Portuguese from Japan.
2. The prohibition of any of his subjects from leaving the empire, and recalling those who were in foreign parts.
3. The publication of severe edicts against gaming, luxury, and duelling.

4. The granting a Dutch factory to be established in Japan.

The persecution against the Christians in Japan, both natives and foreigners, was carried on with such horrid cruelty, that in the space of the four first years of his reign 20,570 persons were massacred. Notwithstanding which, in the two succeeding years, after the churches had been shut, and the public professing of Christianity prohibited, the Jesuits, by their private endeavours, made 12,000 proselytes; and when any of these were detected, they not only absolutely refused to abjure the Christian faith, but readily submitted to death, and suffered martyrdom with astonishing constancy. And indeed, the persecution continued 40 years, reckoning from its commencement in the reign of Taycho, with unremitting cruelty, before Christianity could be totally exterminated. Ijeja reigned about five years after the death of Fide-Jori, and died at about 70 years of age.

33. Fide-Tada, the grandson of the above monarch, as we have already inferred, continued the persecution, till at length the Christians, driven to the utmost despair, retired to the number of 37,000, to the castle of Simabara, in the island of Ximo, where they determined to defend themselves to the last extremity. The Japanese army laid siege to the place, which held out for three months; but at length was compelled to surrender on the 12th of April, 1638, when the Christians were all put to the sword. This monarch reigned 18 years, and was succeeded by his son.

34. Ijeitz. This emperor reigned 21 years, and was succeeded by

35. Ijetzanako. This monarch, who was the son of the former, reigned 30 years, and left the crown to his son.

36. Tsinajos. This prince was the last Japan monarch that we have any authentic account of, and was upon the throne when the Dutch ambassador was at Japan, in the year 1692, being then 43 years of age, and having reigned 13 years; he was a great philosopher, a strict observer of the laws, exceedingly humane and benevolent, and, in the true sense of the word, the father of his people.

S E C T. VII.

The Land of Jesso or Jedso.

JESSO or Jedso extends from 42 to 50 deg. of north lat. which track is known, but how much farther it reaches hath not been ascertained; nor do the Japanese geographers seem better acquainted with it than the Europeans. The southern part lies opposite to the northern coast of Nippon or Japan, and together they form the straits of Sangar and Jesso, which are separated by the little island Matsuma. The Japanese trade to Jesso for furs, and a fish called karasakki, that is caught upon its coast, and which is considered in Japan as a great delicacy; but the natives of Jesso never come to Japan, so they are afraid to cross the straits, though it requires but a day to sail over them.

The natives of Jesso are strong, fierce, and savage; they wear their hair and beards long, and cover themselves all over with the skin of wild beasts, with the fur outwards, so that, upon the whole, they have a most frightful appearance. The Japanese informed captain Saris, that those who live on the southern coast are much more civilized than such as reside in the inland parts; and that the emperor of Japan had a governor, and a garrison in the capital, which is called Matzimai, to receive his tribute, which it paid in furs, feathers, and silver.

The natives are expert in fishing, hunting, and the use of the bow and arrow, which are their only weapons. The country is rocky, woody, but little cultivated, and in many places barren; it only produces a coarse kind of barley, some roots, and a few fruit trees. The people worship the firmament, but have but few religious ceremonies; they are strong, hardy, and addicted to drinking, when they can procure liquor; they have their ears bored, and wear silver ornaments hanging to them.

The above is the account the Japanese give of this country and its inhabitants; but Father De Angeli, a Sicilian Jesuit, who went thither in the year 1620, and resided among the people a considerable time, gives a more favourable description of them, and informs us, that the natives of Jesso are stouter, taller, and fairer than the Japanese; that they let their beards grow very long, but shave the fore-parts of their head; that they make a very strong wine, which they drink to excess; and dress themselves in very pretty silk, cotton, or linen gowns, which are long, and embellished with needlework tolerably executed.

He likewise tells us, that besides bows and arrows, they use lances, scymetars, and poisoned darts; that they are quarrelsome, capricious, passionate, and revengeful; but at the same time almost as ceremonious and insincere as the Chinese; polygamy is allowed among them, and adultery they thus punish: the man pays a pecuniary fine, and the woman is close shaved, which is the greatest disgrace that can happen to her. If the gallant refuses to pay the mulct, the husband has a right to strip him whenever and where-ever he meets him, and send him home naked; to effect which, he calls to his assistance all that are near at hand, who are obliged to aid him in plundering the adulterer. All the particulars mentioned by the above Jesuit are confirmed by several Dutch mariners, who have, since his time, visited Jesso; and farther add, that their boats are made of light boards sewed together with cords made of the bark of a tree, called coxo, which when they return from fishing are unfewed again, and carefully laid up; that many of the natives wear rings on their fingers as well as trinkets in their ears, and paint their lips and eye-brows blue; that the men are very jealous, the women in general modest; and the language a corrupt mixture of the Chinese and Japanese tongues.

They have no place in the whole country that can deserve the name of a city, even Matzimai the capital is a very inconsiderable town. Here the prince of the country, as well as the Japanese governor, resides; but the former is obliged to go once a year to Jeddo to do homage, and make a present to the emperor of Japan.

The manner of executing criminals is something singular, the culprit is laid flat upon his back, his arms and legs being stretched out, and held tight by two stout fellows to each; the executioner then, who is armed with an iron headed club, dances round him, sings a song, and at length discharges such a blow at his head as breaks his skull, which is immediately followed by another upon the stomach that dispatches him in an instant.

Of the Higher Jesso or Oku, we have no other account from the Japanese geographers than that it is 900 miles in length; but the southern parts of Jesso, already described, were conquered by Joritomo, the first Cubo of Japan, and annexed to the dominions of that empire.

C H A P. XX.

2. Of the Islands of FORMOSA and HAINAN.

SOME parts of these islands belong to the Chinese, to whom the natives are subject; but, in the other parts they live independent, and are only subject to their own laws and government.

Formosa, which is the most fertile of these islands, is altogether a very fine country; and for that reason it obtained its name, the word Formosa signifying *fair* or *beautiful*. It is situated nearly opposite to the province of Fo-kien in China, and is computed to be 216 miles in length from north to south, and about 70 miles in the broadest part. Its longitude from Peking is from 3 deg. 20 min. to 5 deg. 40 min. east; so that when the sun is almost vertical over it, the climate is rather hot; but this is far from being disagreeable, as the violence of the heat is greatly mitigated by the situation of the island, which is so elevated as to receive the most agreeable advantages from the cooling breezes of the sea.

Thus while the sun with rays intense assails,
The zephyrs soften with a friendly gale;
Glide through the fainting Formosan's retreat,
And quench the rage of equinoctial heat.

That part of the island possessed by the Chinese is particularly fertile, and produces great quantities of different kinds of grain, especially rice; and its fertility is greatly accelerated by the numerous rivers, whose streams glide conveniently through it.

This island likewise produces as great a variety of fruits as are to be found in any other parts of the Indies, particularly oranges, cocoas, bananas, ananas, goyavas, papayas, &c. Also several kinds of those produced in Europe, as peaches, apricots, figs, grapes and chestnuts. They have likewise a sort of melon, which is of an oblong form, and much larger than those in Europe: they consist of a white or red pulp, and are full of a fine juice, which is exceeding grateful to the taste. Sugar and tobacco also grow here to the greatest perfection; and the trees that produce these are so agreeably arranged, that they appear as if calculated to embellish the most beautiful garden.

The wild beasts of this island are but few, and those seldom seen, as they chiefly inhabit the distant parts of it, which are exceeding mountainous, and seldom resorted to by the inhabitants. They have some horses, sheep, oxen, goats, and hogs. They have but few birds, the principal of which is the pheasant; but the rivers produce great plenty of various kinds of fish.

The coasts about this island are very high and rocky, and have neither havens or sea-ports, so that it is almost impossible to effect an invasion. Teovang, or Tyowang, is the only bay in the whole island, where ships of any bulk can approach; and this is situated at the mouth of a river so narrow, and defended by such high rocks and forts on each side, that no enemy could possibly enter it, without being repulsed.

The inhabitants of those parts of the island belonging to the Chinese have the same manners and customs, and are under the same government, as those of China; so that a repetition of them would be here unnecessary: we shall therefore only describe the persons, manners, and customs of the natives.

The natives of this island, who are subject to the Chinese, are divided into 45 boroughs, or towns, 36 of which are in the northern part, and nine in the southern. They are in general of a low stature, have a large mouth, and are very swarthy in complexion: they have a very high forehead, and are altogether greatly disproportioned, for the body is very short, the neck small, and the arms and legs remarkably long.

They go almost naked, their dresses consisting only of a rough piece of cloth tied round the waist and reaching to the knees; but they adorn their bodies with the figures of trees, flowers, animals, &c. in doing of which they undergo such violent pain, that only a small part of the operation must be performed at one time; so that it will take some months before the whole is completed. These embellishments, however, are only permitted to such as have distinguished themselves either by feats of activity or courage. The better sort avoid the punishment of obtaining these ornaments, by using the hair of animals intermixed with silk, and embroidered with gold and silver. They have all, however, liberty to ornament their arms and ears, which they do with the greatest profusion, and on their heads they wear a kind of coronet, the top of which is terminated by a plume made of the feathers of cocks or pheasants. In short, the whole of their ornaments with the awkwardness of their shape, form together a very whimsical appearance.

The climate of the northern part being less temperate than the southern, the inhabitants are better clothed, their dresses consisting of the skins of beasts, particularly fags, which they kill in hunting. This garment, however, is very uncouth in its form, being shaped like a vestment worn by priests, and without sleeves. They wear a kind of bonnet on their heads, made of the leaves of bananas, and adorned with coronets placed one above another, in the form of a pyramid; the whole is fastened with locks of hair of different colours, and the top of it, like those in the south, is terminated by a plume of feathers.

The houses of those in the northern parts are built after the manner of the Chinese; but those of the south are mean cottages made of earth and bamboo covered with straw, and so close together, that they are only separated by a very slight partition. Their customs, however, in both parts are the same. They have neither chairs, tables, benches, or beds; instead of the latter they use the leaves of trees, which they spread on the floor, and lay themselves down without any sort of covering. They dress their virginals in a kind of chimney or stove placed in the center of the room; and are exceeding filthy in their manner of eating it; they have neither dishes, spoons, or knives, so that when the provision is dressed it is laid on a piece of wood, or mat, and they pull it to pieces with their fingers. They do not take much pains in dressing their meat, for the less it is done the better they like it, and some of them admire it most when it is so raw as barely to have felt the effects of the fire.

Their food chiefly consists of boiled rice, which they eat instead of bread; the flesh of sheep and goats, and game, which they sometimes catch in the woods, by shooting them, or running them down; the latter is the most common method; for their agility is so great, that they will even out-run the swiftest horse.

Their weapons are bows and arrows, which they use with such dexterity, that they will kill a pheasant flying at the distance of 400 yards.

They have little ceremony in their marriages; nor do they purchase their wives as in China. When a man fixes on any object that he wishes to be his wife, he goes several days together with music, which he plays for some time before the door; but he is not permitted to enter the house. If the object of his affections approves of him, she comes out, and they agree upon terms, which being made known to their parents, the marriage feast is prepared, and the friends of each party are invited.

invited. The feast consummates the marriage; after which, instead of the wife going home with her husband, he continues in his father-in-law's house, and provides as well for him as for himself during the remainder of his life.

With respect to their religion, some writers have described them as being mere infidels, which we can assign no other reason for, but from their being considered to be by the Chinese. This, however, is a false assertion: they believe in one Supreme Being, and seem to entertain wiser notions than the inhabitants of many eastern countries. The Chinese acknowledge, that they are not subject to cheat, thieve, or quarrel; but, on the contrary, that they practise all the duties of equity and mutual benevolence. They worship idols as in China, to whom they offer sacrifices of hogs, rice, &c.

Their funeral ceremonies are very trifling, but the manner of treating the dead before interment is very singular. When a person dies, they lay him on a kind of scaffold made of bamboo, which they place over a flow fire for nine days; after which they wrap the corpse in a mat, and lay it on a higher scaffold, covered with a pavilion made of shreds of silk, cloth, &c. Here it remains for two years, at the expiration of which, they dig a large hole in the earth, and bury it. Each of these ceremonies is accompanied with feasting, music, dancing, &c.

The notions of humanity, with which these people are possessed, and the impression an object in distress strikes on their mind, is displayed in one custom, which is almost universal, namely, if a person is exceeding ill, or afflicted with any painful disorder, which is not likely to be removed, they think it a kindness to dispatch him.

The government of each town or borough is confined to itself. Three or four of the most ancient, who are known to be men of integrity, are appointed as judges over the rest, who determine all differences; and he who refuses to submit to the decision, is banished the town, nor can he either return, or be admitted into any of the others, so that he is obliged to finish his days, without ever again participating of the natural enjoyments of society.

The inhabitants here pay an annual tribute to the Chinese, which consists of certain quantities of grain, the tails and skins of fags, and other productions of the country. In order to gather this tribute, a person is appointed to each town, who learns the language of the natives, and discharges the office of interpreter between them and the mandarins of China. There were formerly twelve boroughs in the southern part of the island that paid tribute to the Chinese; but, from the tyrannic conduct of their interpreter, or gatherer of the tax, they revolted, drove the interpreter out of the town, and no longer continued to pay tribute to China.

Having said thus much of the natives, we shall now give some account of the capital city on this island, which, with several other considerable towns, is in the possession of the Chinese.

The capital city here is called Tai-ooun-fou. It is large and populous, and carries on so extensive a trade, that it is little inferior to some of the most opulent in China. It is plentifully supplied with all kinds of provisions, either of its own product, or commodities brought from other countries, as rice, cotton, sugar, wine, tobacco, and dried venison, the latter of which is greatly admired by the Chinese, and considered as the most delicious food. They have likewise all kinds of fruits, medicinal herbs, roots, gums, &c. with plenty of linen, silk, and cotton of various sorts.

The houses are in general very small, and are built of clay, covered with thatch. The streets are long and spacious, and the buildings on each side have awnings, that join in such a manner as to cover the street; but these are only used during the hot months, to keep off the excessive heat of the sun. Some of the streets are near three miles in length, and between 30 and 40 feet broad: these streets are chiefly occupied by dealers, whose shops are furnished with all kinds of goods, ranged and displayed to the greatest advantage. These shops appear very brilliant, and many people walk in

the streets merely to gratify themselves with the sight of so great a variety of the richest commodities.

The city is not defended either by walls or fortifications; but it has a good garrison of horse and foot, consisting of 10,000 men, who are principally Tartars. These are commanded by a lieutenant-general, two major-generals, and a number of inferior officers, who are at liberty to relinquish their situation after having served three years, or sooner, if occasion should require.

The harbour is tolerably good, and sheltered from the winds; but the entrance to it is dangerous for ships of burthen, the bottom of it being rocky, and the water not above ten feet deep at the highest tides.

According to the most authentic historians, the island of Formosa was first inhabited by the Japanese about the beginning of the last century. These people were so pleased with the appearance of the country, that they built several small towns, and soon settled a colony; however, they were but a short time on the island before they were interrupted by the Dutch, a ship belonging to whom being accidentally forced into the harbour, the people landed on the island, in order to obtain refreshments, and repair the damage the vessel had sustained by the storm. Pleased with the apparent fertility of the country, and the wholesomeness of the climate, they formed a plan of circumventing the Japanese, by taking the island into their own possession.

But, however, of offending them, lest it might be injurious to their trade, they were very cautious in what manner they proceeded; and though they were the most powerful, yet they were rather desirous of obtaining their wishes by artful than violent measures. To effect this, they earnestly intreated the Japanese, that they would permit them to build a house near the sea side, which, they alleged, would be of the greatest utility to them in their passage to and from Japan. This request was refused, which produced a second solicitation that met with equal success. Unwilling, however, to give up any endeavours they could project, they again renewed their solicitations, and pressed them to give consent, assuring them that they desired no more ground than what might be encompassed by the hide of an ox. The modesty, as well as oddity, of this request, had the wished-for effect, and the Japanese at length gave their consent.

The Dutch had now made an opening into their future intentions, and immediately discovered a piece of cunning little thought of by the Japanese. They got a large hide, which they cut into a number of slips, and, fastening the whole together, covered a very extensive piece of ground, on which, instead of a single building, they erected several spacious habitations. The Japanese were at first greatly vexed at this stratagem, but, from the singularity of it, they were at length pacified; and were so far from either envying the Dutch, or being any way apprehensive of danger from them, that they permitted them to do whatever they thought proper; and of this indulgence the Dutch were not deficient in taking the greatest advantages, for they soon erected several strong buildings, particularly a castle, which they called Zealand, situated on so advantageous a spot, that it was impossible for any ship to enter it, of whatever force, without being repulsed.

The Japanese, being either offended at the great progress the Dutch had made, or not finding the advantages they expected, soon quitted the island, and left the Dutch in sole possession of it; after which the latter erected other fortifications opposite to their new fort, and raised such other defences, as made them complete masters of the island.

The Dutch, however, continued here but a few years; for one of the Chinese generals (a man of an enterprising genius) being defeated by the Tartars, who were then at war with the Chinese, fixed his views on Formosa, formed a resolution of ousting the Dutch, and establishing a new kingdom on the island. Accordingly he sailed from China with a very considerable fleet, and arriving near the mouth of the harbour, he landed some of his men, and began to attack the fort of Zealand. The Dutch, not being apprehensive of any danger, were ill provided to attack so powerful an enemy: they

had only four ships in the harbour, and not above 20 men in the fort, exclusive of the natives; notwithstanding which they made so forcible an opposition, that the siege lasted upwards of three months. The Chinese general was so enraged in being thus disappointed, that he at length had recourse to a very desperate effort, which had the desired effect. He converted several of his vessels into fire-ships, and the wind happening to be high and favourable, drove them into the harbour, when three of the Dutch ships were entirely destroyed. Thus situated, the Dutch could not make any farther resistance, and the Chinese general offering them liberty to depart with their effects in case they would surrender, they readily accepted the offer; and putting all their valuables on board the ship that was left, they departed, and left the Chinese general sole possessor of the island. The general immediately acknowledged submission to the emperor, and several other towns were soon built on different parts of the island, the inhabitants of which have ever since been subject to the government of China, and, as hath been before observed, testify their submission by an annual tribute.

HAYNAN, the other island to be noticed in this chapter, (the principal part of which also belongs to the Chinese) is of considerable extent, and some of the towns are very populous. It is situated between 107 and 110 degrees east longitude, and between 18 and 20 degrees north latitude. It is bounded on the east by the Chinese sea; on the west by the coast of Cochinchina; on the north by part of the province of Quang-tong, to which it belongs; and on the south by the channel of Paracel, which joins the eastern coast of Cochinchina. It is about 200 miles in length from east to west, near 150 in breadth, and about 400 in circumference.

Its principal city is called Kiun-tcheou, and is so situated, that ships lie at anchor close to its walls with the greatest security. The streets are very uniform, and some of them at least a mile in length, but the houses in general are low mean buildings.

Besides the capital, there are several other considerable cities on the island, all of which are situated near the sea-side, and subject to the jurisdiction of Kiun-tcheou, which is governed by mandarins of two orders, namely, those of learning, and those of arms.

There is a fine port on the southern part of the island, the bay of which is near 20 feet deep. There is also another very convenient port on the northern part, the entrance to which is defended by two small forts, though the depth of water does not exceed 12 feet. Here the barks frequently come from Canton with various commodities, in exchange for which they take several kinds of minerals, the natural produce of the country; for in some parts of the island there are gold and silver mines, as also mines that produce the lapis-lazuli, which the natives of Canton use in painting the blue porcelain. Between the two forts that defend the entrance of the northern port, is a large plain, on which are several handsome Chinese sepulchres.

The climate of this island is in general very unhealthy, particularly the northern part, though the soil is tolerably fertile. The southern and eastern parts are exceeding mountainous; but the vallies beneath are rich, and produce great plenty of rice. Here are likewise several forts of very valuable trees, particularly the rose, or violet-tree, which is so fragrant in its scent, that it is purchased at a very high price for the sole use of the emperor. There is also another tree little inferior to this; it produces a kind of liquid, which the natives call dragon's blood, and, if thrown into the fire, diffuses a scent of the most agreeable nature.

Indigo grows very plentifully on this island, as also sugar, tobacco, and cotton; and they have a great variety of the most delicious fruits.

The chief animals on this island are horses, sheep, cows, and hogs. On the mountains, and in the woods, are prodigious numbers of apes, some of which are very large, of a black colour, and the features of their faces so distinct, as to resemble the human species with greater niceness than any others to be found in the universe;

but these are very seldom seen; and though the natives have often endeavoured to catch them, yet they are so cunning and alert, that they have baffled every machination they could project.

These apes appear to be of the same species with two sent some years ago in a coasting vessel, as a present from a merchant of the rajah of the Carnatic dominions to the governor of Bombay, a particular description of which is thus given by Mr. Grose in his *Voyage to the East Indies*: "They were, says he, scarcely two feet high, walked erect, and had perfectly an human form. They were of a fallow white, without any hair, except in those parts that it is customary for mankind to have it. By their melancholy, they seemed to have a rational sense of their captivity, and had many of the human actions. They made their bed very orderly in the cage in which they were sent, and, on being viewed, would endeavour to conceal with their hands those parts that modesty forbids manifesting. The joints of their knees were not re-entering like those of monkeys, but salient like those of men; a circumstance they have in common with the Orang-outangs in the eastern parts of India, particularly in Sumatra, Java, and the Spice Islands, of which these seem to be the diminutives, though with nearer approaches of resemblance to the human species.

"But though the navigation from the Carnatic coast to Bombay is of a very short run, of not above six or seven degrees, whether the sea air did not agree with them, or that they could not brook their confinement, or that the captain had not properly consulted their provision, the female sickening first died, and the male giving all the demonstrations of grief, seemed to take it to heart so, that she refused to eat, and in two days after followed her. The captain, on his return to Bombay, reporting this to the governor, was by him asked, What he had done with the bodies? He said, he had flung them overboard. Being further asked, Why he did not keep them in spirits? he replied, that he did not think of it. On this the governor wrote adversely to the merchant, desiring him to procure another couple at any rate, as he should grudge no expence to be master of such a curiosity. The merchant's answer was, He would very willingly oblige him, but that he was afraid it would not be in his power: that these creatures came from a forest about 70 leagues up the country, where the inhabitants would sometimes catch them on the skirts of it; but that they were so exquisitely cunning and shy, that this scarcely happened once in a century."

This island also abounds with various kinds of game, particularly deer and hares; also a great plenty of birds, as partridges, woodcocks, snipes, turtle-doves, and molt sorts of water-fowl, all which are little inferior to those in Europe. They have likewise molt sorts of fish in great abundance: among these is a little blue fish found among the rocks, which is so beautiful as to be esteemed of greater value than the golden fish; but they will live only a few days out of their natural element.

The natives of this island are short in stature, of a reddish complexion, and some of them greatly deformed. The men wear only a loose garment, reaching from the waist to the knees: it is made of callico, and the colour is either a deep blue, or quite black. The women wear a garment made of the same stuff, though different in form: it somewhat resembles a waistcoat, and reaches from the shoulders to the knees: and they are farther distinguished from the men by streaks made on their faces with indigo. Both sexes braid their hair, and ornament their ears with rings; and their hats, which tie under the chin, are made of straw or rattan.

Their chief weapons are bows and arrows, in the use of which they are not so expert as the inhabitants of Formosa. They have also a kind of hanger fastened with a girdle to their waist, which they generally use to clear the way in forests, or other woody places.

These natives occupy the center part of the island, which is very mountainous; and here they live independent, being subject only to their own laws and modes of government. They are seldom seen by the Chinese, except when they make an attempt to surprise any of the neighbouring villages. This, however, seldom happens,

pens, and when it does, they are naturally such cowards,
that half a dozen Chinese will defeat at least an hun-
dred of them.

Many of them are in the service of the Chinese, who
employ them to cultivate their lands, and take care of
their cattle. Others of them are allowed to possess vil-
lages on the plain; and the principal part, as in For-
mosa, pay an annual tribute to the emperor of China.

Between the island of Formosa and the continent of
China, are a number of small islands called the *Pisca-
dores*, or *Fisher Islands*, which are situated in 23 deg.
north latitude. On the west side of one of these islands
is a large town, with a fort defended by a garrison con-
sisting of 300 Tartars.

There is likewise a set of islands situated between
Formosa and Luconia. These are called the *Five Isles*,
the northernmost of which lies in 20 deg. 20 min. north
latitude. The largest of these islands is uninhabited,
on account of its being a barren country; but the
others have several good towns in them, and are very
populous.

The hills of these islands are rocky, but the vallies
are very fertile, being well watered with running streams.
They produce plenty of pine-apples, plantains, bana-
nas, sugar-canes, cotton, pompions, and potatoes; and
there are also great numbers of goats, oxen, and hogs.

The inhabitants of this island are of an olive com-
plexion, and are short in stature, with round faces, low
foreheads, and thick eye-brows. They have black hair,
which they cut so short that it barely touches their ears.
The men wear only a cloth about their middle, and
have no covering on their heads. The women wear a
short petticoat made of coarse callico, which reaches
from the waist to the calves of their legs. Both sexes
wear rings in their ears, made of a metal resembling
gold, which they dig out of the mountains.

Their houses are very small, and consist only of a
few posts bounded and covered with boughs of trees.
The fire-place is at one end, and here they lay boards,
on which they sleep. The houses are built in rows one
above another, on the sides of the rocks, and they
ascend to them by the help of ladders. There is a kind
of street to each row of houses, which runs parallel
with the tops of the buildings in the row beneath.

These people are naturally ingenious; they under-
stand the use of iron, which they work into various
forms, and build very neat boats, that resemble
those with us called yawls. They have likewise some
large vessels, which they row with twelve or fourteen oars.

Their food consists chiefly of vegetables; but they
sometimes make a dish of locusts, which at particular
seasons of the year come to devour their plants. They
catch them with nets, and either broil them on the fire,
or bake them in an earthen pan. Their chief drink is
water; but they have a liquor that in taste and colour
resembles English beer. This is called *Bassier*, and
gives name to one of these islands. It is made with
sugar canes, boiled and mixed with black-berries; after
which, it is put into jars, and when it has worked five or
six days, it becomes very fine, and is fit for use.

Their language bears no affinity either to the Chinese
or Malayan, but is peculiar to themselves. The only
weapons they use, are lances headed with iron: when
they go on the mountains in pursuit of beasts, they
wear a kind of armour made of a buffalo's skin, which
has sleeves, and reaches down to the calves of the legs.
It is wide at the bottom, but close about the shoul-
ders, and is of such solid substance as hardly to be pene-
trated.

They are in general a very civil people, and will nei-
ther engage in quarrels among themselves, or with stran-
gers. The men are chiefly employed in fishing, and
the women in husbandry. Each man is prohibited from
having more than one wife, who treats him with great
respect. The boys are brought up by their fathers to
fishing, and the girls work with their mothers in the
plantations, which are in vallies, where every person
plants as much ground as is sufficient to supply the ne-
cessities of the family. They have not any laws, neither
have they occasion for any; every family has one supe-
rior, to whom the rest are subservient; and children be-
have with the greatest respect to their parents. In short,
these people appear to enjoy real felicity, by seeking that
happiness in their own minds which is not to be found
independent of ourselves: they have no ambition, and
therefore are not desirous of leaving their own home to
seek after imaginary baubles; they content themselves
with the situation in which Providence has placed them,
and each succeeding day contributes to encrease their
happiness:

If solid happiness we prize,
Within our breast this jewel lies,
And they are fools who roam;
The world has nothing to bestow,
From our own selves our joys must flow,
And that dear hut our home.

CHAP. XXI.

3. The MARIAN, or LADRONE ISLANDS.

THESE islands, which are about twenty in num-
ber, belong to the Spaniards, and were first dis-
covered in 1521. They obtained the name of
Marian Islands, from Mary queen of Spain, who reigned
at the time of their being first inhabited by her subjects.
They are also known by the name of *Thieves Islands*,
which epithet was given to them by Ferdinand Magellan,
the first person who discovered them, on account of the
continual robberies for some time committed by the na-
tives.

The Ladrone islands lie about 600 leagues to the east of
Canton in China; 700 leagues east from the Philippines,
and 7300 west from Cape Corientes in America. The
principal part of them have been for many years uninha-
bited, notwithstanding they are all pleasantly situated,
and the soil in general is very fertile. The only one
that can properly be said to be now inhabited by the
Spaniards is Guam, where a governor resides, and
where there is kept a very strong garrison. It is at this
island, that the Manila register ship generally takes in

fresh provisions and waters, in her passage from Aca-
pulco to the Philippines.

The islands of Tinian and Rota were once very popu-
lous; but the former is now quite uninhabited, and the
latter contains only a few Indians, who are employed in
cultivating rice for the inhabitants of Guam.

Guam is about 40 miles in length, and 90 miles in
circumference, and the number of inhabitants are esti-
mated at 4000; out of which it is supposed 1000 live
in the city of San Ignacio de Agona, where the governor
usually resides. It is pleasantly situated, and affords a
fine landscape when viewed from the sea. The soil be-
ing rather dry, it produces little rice; but they have se-
veral kinds of excellent fruit, particularly pine-apples,
melons and oranges. They have likewise plenty of
cocoas, yams, and a fruit about the size of an apple,
which, when baked, is exceeding good, and is used in-
stead of bread.

The natives of this island are strong and well-shaped,
but of an olive complexion; they have thick lips, a long
village

visage, and a stern countenance: they wear long black hair, anoint themselves with the oil of the cocoa-nut, and paint their teeth with red and black colours. Their houses are chiefly built of stone and timber, and the tops of them are covered with tiles. Their food chiefly consists of cocoa-nuts, bananas, fowls, fish, and pork; the latter of which is peculiarly sweet in its taste, the hogs being principally fed with cocoa-nuts, which grow here in the greatest abundance.

The indigo plant grows wild in many parts of these islands, as do several other articles, which would be very valuable if properly cultivated; but as the other islands are uninhabited, and are too remote, so the Spaniards indulge their natural indolence by not taking any notice of them.

The natives of Guam, who are Indians, formerly used slings and lances as weapons of defence; but they have for some years been refrained from exercising the latter, instead of which, they use pieces of clay, made of an oval form, and baked so hard as to be little inferior in substance to stone. They throw these with great dexterity, and seldom miss the object. Some of these pieces or balls are so large, and thrown with such force, that they will kill a man, though at a considerable distance.

Notwithstanding they are an unpolished people, yet they are far from being deficient in capacity; and in some things have discovered great abilities in mechanical invention, particularly in the construction of their boats, which are said to be capable of running seven leagues an hour. These boats, which are the only vessels that have been here used for many years, are thus described in Commodore Anson's voyage round the world: "The head and stern of the proa are exactly alike, but her two sides are very different. That intended to be always the lee-side being flat, whilst the windward side is built rounding in the manner of other vessels; but as her small breadth, and the strait run of her leeward side would infallibly make her overset, a frame is laid out from her to windward, to the end of which is fastened a hollow log, formed like a small boat. The weight of the frame is designed to balance the proa, and the small boat, which is always in the water, to prevent her oversetting to windward. In short, the body of the proa is formed of two pieces joined endways, and fastened together with bark; for no iron is used in her construction. She is about two inches thick at the bottom, which at the gunwale is reduced to less than one. The proa generally carries six or seven Indians, two of whom are placed in the head and stern, who steer the vessel alternately with a paddle, according to the tack she goes on, he in the stern being the steersman. The other Indians are employed in baling out the water, which the accidentally ships, or in setting and the trimming the sails. These vessels sail most excellently on a wind, and with either end foremost run from one of these islands to the other and back again only by shifting the sail, without ever putting about; and by their small breadth and the flatness of their lee-side, are capable of lying much nearer the wind than any other vessel hitherto known."

The natives of Guam are not in friendship with the Spaniards, for which reason the latter always keep here three companies of foot soldiers; they have likewise two small castles, each mounting only five guns; and on an eminence near the sea is a small battery, consisting of five pieces of cannon.

The other islands here, though uninhabited, afford a great plenty of provisions; but neither of them have any commodious harbour.

Tinian, which is a very beautiful island, is situated in 16 degrees north latitude, and from its delightful appearance, is called by the Spaniards, Buenavista. It is about twelve miles in length, and six in breadth; and is occasionally visited by the natives of Guam, who sail there in their proas, and bring from thence some of its most valuable productions.

Though this island is uninhabited, yet it is one of the most delightful spots in the universe. It is divided into hills and dales, both of which are beautifully diversified with woods and lawns. The woods consist of tall

trees, whose spreading branches yield the most delicious fruits; and the lawns, which are in general very broad, are covered with a fine trefoil, intermixed with a variety of the most fragrant flowers. Among the fruits is one of a peculiar nature, called Rhyma, and used by the natives of Guam instead of bread. This fruit is particularly described by the writer of Anson's voyage. He says, "It grows upon a pretty lofty tree, which near the top divides into large and spreading branches: the leaves, which are generally from a foot to eighteen inches in length, are of a remarkable deep green, and notched about the edges. The fruit, which is found indifferently on all parts of the branches, is rather of an oval form than round, it is covered with a rough rind, is usually seven or eight inches long, and each of them grows singly. It is most proper to be used when green, but it must be full grown; and being roasted in the embers has some distant resemblance in taste to the bottom of an artichoke, and, like that, is of a soft and spongy nature. As it ripens, it becomes softer, turns yellow, and has a luscious taste, with an agreeable smell, not unlike a ripe peach: however, it is then esteemed unwholesome, and is said to produce fluxes." This excellent and useful fruit is in season eight months in the year, and grows to a more considerable size than in any of the neighbouring islands.

Here are also many other vegetables of a very useful nature, as scurvy-grass, sorrel, mint, dandelion, creeping purslain and water-melons; all of which are efficacious for many disorders, particularly those of a scorbutic nature.

This island likewise abounds with cattle, and in the woods are great plenty of different sorts of poultry. The cattle are so numerous, that it is no uncommon thing to see some hundreds of them grazing together; which, when the island is viewed from the sea, greatly enhances the beauties of the prospect. The flesh of these animals is well tasted, and very easy of digestion. The poultry is also exceeding good, and very readily obtained. They are in general large, and can hardly fly an hundred yards at a time, so that they are frequently caught by being run down, which is the better effect of from the openings of the woods, that in some parts are very considerable.

Near the center of the island are two large pieces of water, which are well stocked with plenty of wild fowl, as ducks, teal, curlews, and a bird called the whistling plover. The natives of Guam catch these with snares, which are ingeniously projected, and this is the only method whereby they can obtain them, as they are refrained from the use of fire arms.

The only inconveniences that attend this island, arise from the great number of musketoes, and other species of insects, which, if they happen to fix on the skin, will produce an immediate inflammation, and if proper remedies are not soon applied, will be productive of the most fatal consequences. There are likewise some scorpions and centipedes; but these are so few, that they are seldom seen.

This island, as before observed, was once exceeding populous, being said to have contained at least 30,000 inhabitants. It was in this situation about the beginning of the present century, when a dreadful mortality raging among the inhabitants, prodigious numbers of them died; and the mortality raging with equal violence in the islands of Rota and Guam; the Spaniards obliged those that remained at Tinian to remove to Guam, in order to make good the deficiency by the number of souls that had perished in that island; since which time Tinian has been totally uninhabited.

That Tinian was once a populous place is evident from the ruins of buildings still to be seen, many of which are of a very particular form. They generally consist of two rows of pyramidal pillars at about twelve feet distance, each pillar in the rows being about six feet asunder. The pillars are composed of sand and stone cemented together; they are about thirteen feet high, and almost five feet square at the base: the top of each is crowned with a semi-globe, which is made of the same composition as the pillars, and is quite solid. natives

natives of Guam say, these are the remains of buildings once set apart for those who had engaged to preserve some religious vow. This, indeed, might have been the case, as institutions of a monastic nature are to be met with in most Pagan countries; but if we suppose them only to be the remains of common dwelling-houses, it is a convincing proof that the number of inhabitants here must have been considerable, as there are many of these ruins dispersed in various parts of the island.

The island of Rota has not any thing in it that demands particular attention. Its chief produce is rice, which is cultivated by a few Indians, who live there un-

disturbed, but are subject to the Spanish governor that resides at Guam.

The other islands, though uninhabited, are in general exceeding fertile, the air good and the climate temperate. They also produce plenty of provisions; but they are seldom visited on account of the great inconvenience arising from the want of water for anchorage. That which has the greatest convenience in this particular is Tinian; but even there it is very unsafe, particularly from June to October, which is the season of the western monsoons.

CHAP. XXII.

4. The PHILIPPINE ISLANDS.

THE Philippine Islands, which are about 1100 in number, lie from 5 to 19 deg. north lat. and from the 114th to the 130th deg. of east long. being situated in the Pacific Ocean, 300 miles to the south-east of China.

These islands, in general, profusely abound with every delicacy that could glut the most luxurious appetite; and the soil is inconceivably fertile, but the excessive heat from their vicinity to the line, the innumerable noxious insects, and venomous reptiles; the dreadful earthquakes, the frequent eruptions from many of their mountains, which are volcanoes; the great number of poisonous herbs and flowers, from which the most pernicious vapours exude, and the terrible storms of thunder, lightning, and rain, which spread shocking devastations around, combine to render them neither safe nor desirable. In fine, this cluster of islands resembles a fair person with a foul temper.

Beauties can thus enchanting smiles impart,
While secret malice lurks within the heart;
Till left in tears, the hapless lover drowns,
Martyr'd by falsehoods, sacrific'd by frowns.

The principal of these islands are,

1. LUCONIA or MANILA. This island is the largest of the Philippines, being near 400 miles in length and above 180 in breadth; it is situated in 15 deg. north lat. is deemed more healthy than any other of the Philippines; has many mountains which contain gold, fertile plains, fine pastures, and springs of the most excellent water in the universe. It produces buffaloes, cows, sheep, hogs, goats, horses, fruit, &c.

The city of Manila lies upon an excellent bay, which is circular, and near 90 miles in circumference; the port is of course remarkably good, and well situated for the Chinese and East-India trade. It contains about 3000 inhabitants; and during the late war, was, in 1762, taken by Admiral Cornish and Sir William Draper. It was, however, it pulsed to be ransomed: but the ransom money hath never yet been entirely discharged. It is a handsome city, containing several spacious streets, good houses, elegant churches, decent convents, and tolerable colleges: the seat of the Spanish government is here. The priests take infinite pains to make converts to the Romish faith, and have been pretty successful in their endeavours. The Indians pay a peltax; and a considerable sum of money is annually allowed for the support of female orphans, born of Spanish and Indian parents.

2. St. John lies between seven and eight deg. north lat. is above 110 miles in length, and about 70 miles in breadth where broadest. The soil is fertile, but with the other islands it partakes of the general inconveniences before recited. The inhabitants are good-natured and

humane, but exceedingly ignorant; their marriage ceremony is nothing more than putting earth upon the head of the woman, in token of her subordinate state, and the necessity of implicit obedience to her husband; they call themselves Christians, but their notions of Christianity are so few, that they fancy baptism all that is necessary; previous to baptism, however, they think it indispensably requisite to immerse their children in water. They wear only a loose robe of cotton or callico, which hangs to their feet; the men throw it over their shoulders and wrap it round their waists, the women cover their heads with it like a hood, and clothe it at their breasts; but the men go bare headed, and the children naked. In this island there is only one town, which is erected upon posts, but it is both inconsiderable and mean, and the furniture of the houses despicable.

3. Mindanao is 180 miles in length, and about 130 in breadth; the hills are stony but produce many trees; the vallies are fertile and well watered, and the inhabitants are plentifully supplied with all the necessaries, and many of the luxuries of life.

This island is governed by a sultan, subordinate to whom are several petty sovereigns, who rule over various districts. The above monarch, when he goes abroad, is carried in a palanquin, and has a strong guard to attend him, who are armed with lances, swords, and bayonets.

The natives of Mindanao trade chiefly to Manila and Borneo; and the Dutch come from the Moluccas to purchase of them rice, tobacco, bees-wax, &c. The common people are always boasting of their honesty, and practising roguery; they steal whatever they can lay their hands on; and the magistrates instead of punishing the delinquents will protect them in order to partake of the booty.

The inhabitants of the various districts, or subjects of the several petty kings, speak a different language, but have a general resemblance in persons and features; they are short of stature, have tawny complexions, small eyes, little noses, wide mouths, thin lips, black teeth, and lank hair; they are ingenious, yet indolent; active, yet lazy; and good-humoured, though revengeful. They live on the flesh of buffaloes, most kinds of fowls, all sorts of fish that their seas and rivers afford, rice and sago. They are, however, but slovenly in their cookery, and eat without either knives, forks, or spoons.

The Spaniards had formerly some settlements in this island, but were driven from hence by the natives, who are ever since extremely jealous of any foreigners making any settlements among them.

The inhabitants in general are Mahometans; those who reside in the interior parts of the country are called Hilanons, and possess several gold mines. The people

ple of the north-west part of the island are the most savage; and in making war neither give or take quarter; they allow of polygamy; and are subject to fluxes, agues, cholera, and the scurvy.

The city of Mindanao, which is the capital of the whole island, is situated on the south side of the island, in 6 deg. 20 min. north lat. and 123 deg. 15 min. east long. It is watered by a small river that will not admit of ships of any considerable burden, and those that do come up to the city are greatly in danger of having their bottoms destroyed by worms, which abound in that river, unless they are well sheathed. The city is square, being about a mile each way, the houses are built upon posts, near 20 feet high, with ladders to ascend to them, according to the usual fashion of building in the Philippine Islands; they consist of but one floor, but are divided by partitions into many apartments. The sultan's palace is supported by 150 wooden pillars, or rather posts, and is much higher than any other house in the city, having iron cannon in the hall, and a broad fixed stair-case to ascend to it. The Malayans, as well as the language proper to the island, is spoken in this city. All the floors of the houses are matted, upon which the people sit cross-legged; and the principal trades are ship-builders, goldsmiths, and blacksmiths.

4. Bohol is situated to the north of Mindanao, being about 120 miles in circumference; it produces cattle, fish, roots, rice, and gold.

5. Layte is about 270 miles in circumference, and is situated about 20 leagues north of Mindanao; a chain of mountains runs through the middle, and occasions such a singular variety in the climate, that while the northern side is benumbed with the chilling blasts of winter, the southern parts are cheered with the genial warmth of summer. The soil is in general fertile, and the people tolerably civilized.

6. Paragon, by some called Little Borneo, lies between 9 and 11 deg. north lat. and 114 and 118 deg. east long. and is the remotest of the Philippine islands to the south-west; it is 240 miles in length, and 60 in breadth; different parts of it have different masters; the interior districts belong to the native Indians, the north-east parts to the Spaniards, and the south-west to the sovereign of Borneo. The Indian inhabitants are Mahometans, and possess the most military spirit of any people who are natives of the Philippines. It produces prodigious large figs, a smaller sort, which is superior, and plenty of rice. Three inconsiderable islands, called Calamianes, lie to the north and north-east of Paragon, which are remarkable for nothing but producing the edible birds nest.

7. Mindora is about 60 miles long, and 36 broad, and extends from 12 to 13 deg. north lat. and from 119 to 120 east long. It produces gold and pepper, and is divided from Luconia by the freights of Mindora.

8. Philippina was the first that was discovered of this cluster of islands, and consequently gave name to the rest. It lies between 12 deg. and 14 deg. 30 min. north lat. and is the most fertile and pleasant of all the Philippines, exhibiting a scene of perpetual verdure; for here the sun, which is powerful, without being disagreeable,

—“Wakes the flowers that sleep within the earth,
“And calls the fragrant infants out to birth;
“The fragrant infants paint th' enamel'd vales,
“And native incense loads the balmy gales;
“The balmy gales, the fragrant convey
“To heaven, and to their gods an offering pay.

9. Sebu, southwest of Layte, is 60 miles long, and 38 broad; on the east side of it is the town of Nombre de Dios. The Spanish standard was first set up here by Magellan, the primitive circumnavigator of the world, who was afterwards murdered in this island by the natives. The town of Nombre de Dios is guarded by a considerable garrison, defended by a strong fort, and has a good haven; the island produces cotton, bees-wax, garlick, onions, and the plant abaca, of which cordage and packthread are made.

10. Pansy lies between 10 and 11 deg. north lat. and 120 and 121 east long. and is about 300 miles in circumference, and has the name of being the most populous of all the Philippines; it is watered by many rivers, and is exceeding fruitful, particularly in rice, of which it produces about 100,000 bushels annually above what the natives consume. Almost adjoining to this is the little island Imavas, which is remarkable for nothing but producing a considerable quantity of sarfaperilla.

11. Negroes Island lies between 9 and 11 deg. north lat. and is about 300 miles in circumference. The natives are the blackest of any of the inhabitants of the Philippines, from which circumstance the island is called Negroes Island. Bees-wax and cocoa-nuts are the only produce of the place: the bees are remarkably fine and large, and the people uncommonly skillful in managing them; but, in other respects, the natives are rude, brutish, and ignorant, which has given rise to this proverbial expression, *Negroes Island is inhabited by blacks and bees, but the winged natives are wiser and better governed than the walking natives*. Indeed, the prudence, decorum, and various regulations of these sagacious little insects, are truly astonishing.

“Of all the race of animals alone,

“The bees have common cities of their own,

“And common sons; beneath one law they live,

“And with one common stock their traffic drive;

“Each has a certain home, a fev'ral stall,

“All is the fates, the state provides for all;

“Mindful of coming cold they share the pain,

“And hoard, for winter's use, the summer's gain,

“Some o'er the public magazines preside,

“And some are sent new forage to provide;

“All with united force combine to drive

“The lazy drones from the laborious hive;

“Their toil is common, common is their sleep;

“They shake their wings when morn begins to peep,

“Rush through the city gates without delay,

“Nor ends their work but with declining day.”

12. Xolo is the most south-westerly of all the Philippines; and is governed by a sovereign prince of its own: it produces great quantities of rice and elephants teeth, and indeed is the only island, among the Philippines, in which elephants are bred. The air in this island is tolerable, being refreshed by frequent rains; the sea yields pearls, and great quantities of ambergris are found upon the shores; the soil is fertile in fruits, rice, and pepper; and numerous herds of cattle graze in the pastures.

13. Masbate lies to the westward of Tandaya, is 90 miles in circumference, and abounds in gold, civit, bees-wax and salt.

To speak of these islands in a general sense, it must be allowed that they are extremely rich, and might be rendered as serviceable to Spain as their American colonies; but either through the ignorance of the Spanish ministry, or the neglect of the court of Spain, they have hitherto been rather a burthen than a benefit. That they might be a source of great wealth to the possessors will appear evident to those who consider that they produce great quantities of gold, and other metals, pearls, ambergris, loadstones, ivory, bees-wax, an excellent fruit called tanger, of which a most delicious pickle is made; mangoes, durians, oranges, larger and better than those of Europe; lemons, both four and sweet; palm-trees, of which there are 40 species, the principal being the fago; tamarinds, plantains, bananas, casha-tree, ebony; most of the common timber trees, sugar canes, tobacco, indigo; odoriferous and medicinal herbs; admirable flowers; most culinary vegetables, particularly potatoes, &c.

Providence hath kindly placed a singular species of cane-trees about the mountains of these islands, which being cut yield water in great plenty. These canes afford great relief and refreshment to the natives, who would otherwise be parched with thirst, as no running streams or springs are found in any of the mountains where they grow. So wise and bountiful is Providence in all his dispensations,

“The

" The

" The holy pow'r, that cloths the senseless earth
" With woods, with fruits, with flowers, and verdant plains,
" Whose bounteous hands feed the whole brute creation,
" Knows all our wants, and has enough to give us."

They have one plant that has all the properties of, and is used as a substitute for, opium; of this the natives are very fond, and frequently intoxicate themselves with it.

The camondog-tree is of such a poisonous nature, that instant death seizes any living creature who tastes either its fruit or leaves: it suffers no verdure to grow beneath its shade, and if transplanted, poisons all vegetables that are near it, except a shrub, which is an antidote to it. The natives make an incision in this tree, from whence a liquor flows, into which they dip the points of their arrows and darts in order to poison them; after which, a wound received from any of those weapons proves mortal. Besides this tree, there are many poisonous herbs and flowers, as we have already observed, whose effluvia has very dreadful effects. But the wise Creator has furnished all these islands with shrubs and herbs that are antidotes to those of a poisonous nature, and prevent their baleful effects, if properly used; of these, the most particular is a plant that bears some resemblance to ivy, the fruit of which, when pounded into a powder, and taken in any kind of drink, is a most powerful anti-poison, and consequently much valued by all who inhabit these islands.

The Philippines likewise abound in cattle of all kinds, wild beasts, whose flesh and skins are valuable articles; horses, sheep, civet cats, game fowls, fish, &c.

The alligators are very dangerous; and the signana, a kind of land alligator, does a great deal of mischief. Here are abundance of snakes, scorpions, centipedes, &c. The peacocks, parrots, cocoties, and turtle doves are very beautiful; the xolo bird eats like a turkey, the camboxa is a well tasted fowl peculiar to these islands; and they have another kind of fowl, whose flesh and bones are quite black, they are nevertheless delicious food. The herrero, or carpenter, is a fine large green bird. It is called carpenter because its beak is so hard, that it digs a hole in the trunk, or some large branch of a tree, in order to build its nest.

A sea-fowl, called the tavan, lays its eggs in the sand to be hatched by the heat of the sun; the valuable birds that build the edible nests are called salignaro, and are very numerous in these islands.

The monkeys and baboons found here are very fagacious; during the season, when there is no fruit to be got, they go down to the sea-side to catch oysters; that the fish may not pinch their paws, they put a stone between the shells to prevent their shutting close.

The inhabitants of these islands in general are composed of native blacks, and tawnies; Chinese, or the posterity of Chinese, who have long settled among them; Malayans, Portuguese, Spaniards, other Europeans, and a mongrel breed from the whole; the male features, complexions and manners of the people consequently vary from each other.

The blacks have long hair, and are as exactly proportioned and well favoured as any of their colour; some of them dress after the Spanish fashion, but others have only a cloth round their waists; they are all fond of any thing that glitters: the women tie up their hair, and decorate it with jewels, if they can get them, but if not, they substitute glass beads in their room, not to lose the opportunity of being fine: they likewise adorn themselves with bracelets on their arms and legs, pendants in their ears, and rings on their fingers; and

some of them paint their faces and bodies. The Chinese, Spaniards, Portuguese, and Malayans, dress according to the manner of their respective countries.

The food of the natives is rice, fish, and fruit, but very little flesh; they drink water, palm wine, and spirits distilled from cocoa and palm-trees. The Spaniards, however, live luxuriously, eating flesh at noon, and fish at night, and indulging themselves with all manner of Asiatic delicacies; Spaniards, as well as natives smoke tobacco, but the latter only chew betel and areca.

Their amusements are swimming, bathing, dancing, music, and dramatic performances; their weapons are bows, arrows, lances, daggers, and darts; and they defend themselves with helmets, shields, and breast-plates.

Among some of the Indian nations polygamy is permitted, but in others it is not allowed, except in cases of barrenness; they admit of divorces, which frequently happen; the husband buys the wife from her father, or nearest relation; a beast is sacrificed, an entertainment made of the flesh, and the bride and bride-groom having eat together from the same trencher, are deemed lawfully married.

Children are either named after herbs or flowers, or from some accidental circumstance that occurs at the time of their birth; but as soon as they marry they chuse new names, and their parents are obliged to make use of their old ones.

The dead are washed and perfumed, wrapped in silk, and put in a close coffin, near which a chest is placed that contains the arms of a man, or domestic utensils of a woman; mourners are hired to assist in making a dismal noise, but as soon as the body is buried, an entertainment is made, and all is converted to mirth and festivity. In general they return in black garments, and shave their heads and eyes-brows. They are all exceedingly superstitious, prone to the most gross idolatry, and their religious tenets are a jumble of ideas ridiculously absurd.

The Carolines or New Philippine Islands, are but very imperfectly known; the only accounts we have of them are those written by two priests, viz. Father Clan and Father Gobien, which were composed at Manila, and said to be founded on a description of them given by some of the natives, who were driven by stress of weather upon the island of Tandaya, in the year 1696; these accounts, which place those islands between 6 and 12 deg. north lat. and 127 and 133 deg. east long. were published in the Philosophical Transactions; they are nevertheless deemed fabulous by many, and the more so, as they contradict each other: one of the missionaries making them 32 and the other 87 in number.

Those gentlemen from their hear-say intelligence, however, inform us, that they are exceeding populous, and governed by a king, who resides in one of them, named Lamaree; that the natives resemble the Malayans, go almost naked, paint their bodies, speak a language somewhat like the Arabic; are without any form of worship, make no set meals, live temperately, &c. They have a few fowls, plenty of fish, and fertile lands, but they are without quadrupeds of any kind; the women adorn themselves with necklaces, bracelets, and rings, all made of tortoise-shell: but, to conclude, these writers both agree in the same inconsistencies, viz. after informing us they are of so placid a disposition that no quarrel ever happens among them, and war is totally unknown; they proceed to describe their weapons, and to let us know that they take a great deal of pains to make what must prove useless incumbrances, as they have no foes to fight, quarrels to decide, beasts to hunt, or game to kill.

C H A P. XXIII.

5. The CELEBES, or Island of MACASSAR.

THIS is a very extensive and populous country, containing, besides the city of Macassar, which also gives name to the island, many good towns well inhabited. It is divided from Borneo by the straits of Macassar, as it is by the ocean from the Molucca Islands, on the east, and the Philippines on the north. Its extent from north to south is upwards of 300 miles, and in the broadest part it is near 240. It is divided into six petty kingdoms or provinces, the principal of which are, Celebes on the north-west, and Macassar, which takes in all the southern part of the island. As all the other provinces are subject to these two, the island is sometimes called by the name of one, and sometimes by the other.

The climate is both hot and moist, and therefore unhealthy, except at the time of the northern monsoons. The western part lies low and flat, but the southern part is very high. In the rivers here is found gold dust, which is washed down in the sands from the neighbouring hills by the great torrents of water that sometimes fall after excessive rains.

This country produces great plenty of various kinds of vegetables, which are all excellent in their qualities; the rice in particular is said to be much superior to that cultivated in any other part of the Indies. Their fruits and flowers are much the same as those in the Philippines. They have pepper, sugar, betel and arek, with the best cotton and opium; and their cattle are much larger and finer than any to be met with in other eastern countries. Their oxen and buffaloes are used only for draught, and they have very small horses for riding; but the natives use no other saddle than a painted cloth, without stirrups or bridle, having only a cord fastened to a bit made of wood. These horses have a very hardy hoof, and are never shod.

In the woods and forests are prodigious numbers of monkeys and baboons, which are so large, and go together in such considerable bodies, that they are very dangerous to travellers. They are of different colours, some of them being quite black, some of a straw colour, and others white, the latter of which are in general as large as a mastiff, and much more mischievous than the others. Some of them have long tails, and walk on all fours; and others are without tails, and walk upright, using their fore feet as hands, and in their actions greatly resembling the human species. Their going in such prodigious numbers together secures them from the more powerful beasts of the forest; but they have one enemy by whom they are sometimes conquered, namely, serpents, which are here of a most extraordinary size, and have such agility and strength, that they will pursue them to the tops of trees, and frequently destroy them.

There is but one large river in the island, and this is dangerous by reason of its being greatly infested by crocodiles. It runs from north to south into the bay of Macassar, where it is about half a league broad, and washes the walls of the city of that name: its channel is deep enough in some places to admit the largest vessels; but in others it is very shallow.

The natives of this island are rather short in stature, and of a light olive complexion. they are particularly fond of having flat noses, inasmuch that they practise methods in their infancy to obtain that distinguished form with as much labour and attention as the Chinese ladies do to acquire small feet. Neither men or women wear any covering on their heads, but their hair, which

is of a fine shining black, is ingeniously tied up, and from it hang curls that lay gracefully on the neck and shoulders. The men ornament their hair with jewels, but the women do not; the latter only wear a gold chain round their necks. Both sexes, however, dye their nails red, and their teeth either black or red.

The dress of the lower sort of people consists in a loose garment made of cotton, which reaches below the knees; but none of them wear either shoes or stockings. The women have a long garment made of muslin, with strait sleeves that button at the wrists, besides which they wear a kind of drawers made of cotton, that are fastened round the waist, and reach to the ankles. The garments of the better sort are made of scarlet cloth, or brocade silk, with large buttons of solid gold. They have likewise a very handsome fish made of silk, and embroidered, which contains their dagger and purse.

The diet of the common people consists principally of rice, herbs, roots, and fish; and their usual drink is water or tea: the better sort eat flesh and poultry, the former being generally beef or kid, which are both exceeding fine; and they drink tea, coffee, and chocolate, the latter of which they get from the Spaniards in the Philippine Islands: they also use palm wine, arrack, and other spirituous liquors. They have but two meals a day, one in the morning, and the other about sunset, the latter of which is the principal; in the intermediate space they refresh themselves by chewing betel and arek, or smoking tobacco intermixed with opium. They sit cross-legged on the floor at their meals, and have very low tables for their provisions, which are set on them in plates or dishes made of wood; but they use neither knives or spoons.

Their houses are small but very neat, and are chiefly built of ebony, and other wood of variegated colour. They have but little furniture, except the necessary utensils for dressing their provisions; but what they have is always kept exceeding clean; and to prevent the house being made filthy, they have vessels to spit in when they chew betel or smoke tobacco.

The men are in general very robust, and naturally so courageous, that they are esteemed the best soldiers in India; for which reason they are frequently hired into the service of other princes, in the same manner as the Swiss are in Europe. Their arms are sabres and daggers, the latter of which they often infect with poison; and they have trunks, from whence they blow poisoned darts: these darts are pointed with the tooth of a fish dipped in the venomous juice of certain drugs that grow in the country, and it is said they will strike a mark with them at near 100 yards distance.

The natives of this island were the last enslaved by the Dutch, who, however, could not effect a conquest till after a very long and expensive war, in which were employed almost all the force they had at that time in India. The Dutch first joined the natives to oppose the Portuguese, who made an attempt to subdue this island; but the latter being soon conquered, the Dutch immediately took sole possession of it, and have preserved an absolute dominion over it ever since.

The reason why the Portuguese, and the Dutch after them, endeavoured to subdue this island, arose from its being situated near the Molucca and Banda Islands, which produce such great plenty of cloves and nutmegs, the possession of which they could not have secured without being masters of this island.

These

These enslaved natives, if well used, are in their disposition loving and faithful; but if ill treated, they will not be satisfied till they have had revenge on the party by whom they were injured. They are hasty and passionate; but they have such just notions of honour, that when they discover themselves to be wrong, they will condemn their own conduct, and be glad to comply with any submission that may be thought necessary as a recompense for the offence committed.

They are very industrious, quick of apprehension, and have very retentive memories. Their minds seem to be strongly impressed with the most just ideas of friendship and all social duties; some of them have been known to hazard their lives and properties in defence of an injured stranger; while others have sacrificed their estates for the relief of the distressed.

The women of Celebes are obliged to be very circumspect in their carriage, and very careful not to be seen in company with any other man than their husband. When this happens to be the case, the husband is indemnified if he kills the man he finds with his wife. The least familiarity a married woman shews to a strange man, even though but a glance of the eyes, is considered as a sufficient injury, and the husband readily obtains a divorce. On the contrary, the husband is permitted to have as many wives and concubines as he thinks proper; and the more children he has, the greater he is considered as being useful to society.

The natives here of both sexes are rendered active by a custom practised during their infancy. Every day their nurses rub them with oil, or water just warm; and these unctions encourage nature to exert herself with the most extensive freedom. Male infants are taken from the breast when a year old, their parents having an opinion, that if they sucked longer, it would greatly prejudice their understandings. When they are five or six years old, the children of any distinction are entrusted to the care of some relation or friend, that their courage may not be weakened by the caresses of their mothers, and a habit of reciprocal tenderness. They do not return to their parents till they arrive at the age of 15 or 16, when the law allows them to marry; but this is a liberty they seldom use till they are thoroughly versed in the exercise of arms. The boys are sent to school to the priests, who teach them reading, writing, arithmetic, and the precepts of the Koran; for though they retain many Chinese ceremonies, yet they are professed Mahometans. The girls are taught to read and write; to spin, cook, and make cloths; for as there are not any tailors here, the women not only make their own cloaths, but also those worn by the men; and some of them are so industrious and expert, that they will obtain very handsome fortunes by that profession.

The inhabitants of this country are so little addicted to infamous practices, or litigious disputes, that they have neither lawyers, attorneys, or bailiffs. If any differences arise, the parties apply personally to the judge, who determines the matter with expedition and equity. In some matters of a criminal nature they are permitted to do justice to themselves; and if a man detects another in the commission of adultery, murder, or robbery, he has a right to execute justice himself, by destroying the culprit.

In the celebration of marriage, the husband receives no other portion with his wife than the presents she received before marriage. As soon as the priest has performed the ceremony, the new-married couple are confined in an apartment by themselves for three successive days, having only a servant to bring them such necessities as they may have occasion for, during which time their friends and acquaintances are entertained, and great rejoicings made at the house of the bride's father. At the expiration of the three days the parties are set at liberty, and receive the congratulations of their friends; after which the bridegroom conducts his wife home, and each apply themselves to business, he to his accustomed profession, and she to the duties of housewifery.

When a man has reason to suspect his wife of infidelity, he applies to the priest for a divorce; and if the

complaint appears just, there is no difficulty in obtaining it. In this case the secular judge pronounces the accused party guilty, declares her to be divorced, and settles the terms; after which both parties have liberty to marry again.

These islands are all Mahometans; but they had originally strange notions of religion: they believed there were no other gods but the sun and moon; and to them they sacrificed in the public squares, not having materials which they thought sufficiently valuable to be employed in erecting temples. According to their creed, the sun and moon were eternal as well as the heavens, whose empire they divided between them. These absurdities, however, had not so lasting an influence either over the nobles or people as is found in the religious doctrines of other nations. About two centuries ago, some Christians and Mahometans arriving in the country, communicated their religious sentiments to some of the principal people, when the chief king took a disgust to the national religion. In consequence of this he determined to adopt one of the new systems that were now offered, and for this purpose he convened a general assembly. On the day appointed, he ascended an eminence, where, spreading out his hands to heaven, and in a standing posture, he addressed himself to the Supreme Being, requesting that he would by some means inform him which of the two systems of religion were the most pleasing to his will: and in the fervency of his prayer thus exclaimed, "Speak, O my God, since thou art the author of nature thou canst discern the bottom of our hearts, and knowest that it is impossible they should entertain any thoughts of disobedience. But if thou condescendest not to make thyself understood by mortals; if it is unworthy of thine essence to employ the language of man to dictate the duties required of man; I call my whole nation, the sun which enlightens me, the earth that supports me, the waters that encompass my dominions, and myself to witness, that in the sincerity of my heart, I seek to know thy will: and I declare to thee this day, that I shall acknowledge, as the depositaries of the oracles, the ministers of either religion whom thou shalt cause to arrive the first in our harbours. The winds and the waves are the ministers of thy power; let them be the signals of thy will."

When the prince had finished, the assembly broke up, with a determined resolution to wait the orders of heaven, and to follow the first missionaries that should arrive in the country. The Turks were the most active, and the apostles of the Koran soon after arrived; in consequence of which the sovereign and his people embraced Mahometanism, and were circumcised, and the other parts of the island soon followed their example.

These people are great pretenders to magic, and carry charms about them on a supposition of their securing them from every danger. When any one is so ill as to be given over by the physician, the priests are sent for, who attributing the violence of their disease to arise from some evil spirit, first pray to them, and then write the names of God and Mahomet on small pieces of paper, which are carefully hung about their necks; and if the patient does not soon recover, his death is considered as inevitable, and every preparation is made for the expected period.

Their funeral ceremonies are performed with great decency, to secure which the deceased person makes provision while in health, by assigning a certain sum to defray the incidental expences. As soon as a person is dead the body is washed, and being clothed in a white robe, is placed in a room hung with white, which is scented with the strongest perfumes. Here it continues for three days, and on the fourth it is carried on a palanquin to the grave, preceded by the friends and relations, and followed by the priests, who have attendants that carry incense and perfumes, which are burnt all the way from the house to the grave. The body is interred without a coffin, there being only a plank at the bottom of the grave for it to lie on, and another to cover it; and when this last is placed, the earth is thrown in, and the grave filled up. If the person is of any distinguished quality, a handsome tomb is immediately placed over the grave, adorned with flowers; and

and the Dutch after island, arose from its of Banda Islands, of cloves and nut- they could not have this island.

These

the relations burn incense and other perfumes for 40 successive days.

The government of this island was formerly monarchical; and in order to prevent the crown falling on an infant, the eldest brother succeeded after the death of the king. All places of trust in the civil government were disposed of by the prime ministers; but the officers of the revenue and of the household were appointed by the sovereign. The king's forces, when out of actual service, were not allowed any pay, but only their cloaths, arms and ammunition. It is said that in some former wars, he has brought into the field 12,000 horse and 80,000 foot.

The last war with the Dutch produced the total destruction of both king and country; since which this island has been under the government of three different princes, who are constantly at variance with each other; which is a very favourable circumstance for the Dutch, who might otherwise meet with a powerful opposition, and be deprived of those advantages they have so long possessed on this side the globe.

These princes hold assemblies at particular times on affairs that concern the general interest; and the result of their determinations becomes a law to each state. When any contest arises, it is decided by the governor of the Dutch colony, who presides at this diet. He holds a watchful eye over these different sovereigns, and keeps them in perfect equality with each other, to prevent any of them from aggrandizing himself to the prejudice of the company. The Dutch have disarmed them all, under pretence of hindering them from injuring each other; but in reality with a view only to keep them in a state of subjection.

The Chinese, who are the only foreigners permitted to come to this island, bring hither tobacco, gold wire, china, and unwrought silk: in return for which they take opium, spirituous liquors, gum lac, and linens. They get but little gold from hence, but great quantities of rice, wax, slaves and tripang, a species of mushroom, which, the rounder and blacker the more excellent it is esteemed. The customs bring in 80,000 livres to the company; but they obtain a much larger profit from their trade, and the tenth part of the territory, which they hold in full right of sovereignty.

Macassar, the chief city here, is situated on the

banks of the river of the same name, near the south-west corner of the island. Here the Dutch have a very strong fort mounted with a great number of cannon; and the garrison consists of 800 men.

The streets of the city are in general very long and spacious, and are planted on each side with trees, but there are not any of them paved. The mosques and houses of the quality are built of stone; but those of the common people are built of wood, and elevated from the ground by pillars. They are made of wood of various colours, and the tops of them are covered with palm or cocoa leaves. Here are large markets for the sale of provisions and other commodities. The markets are opened twice a day, viz. in the morning and evening, before the rising and setting of the sun. The provisions are brought to market and sold by women only; for if a man was to be seen in that character, he would be treated with the most distinguished contempt. The number of inhabitants in this city were formerly estimated at 160,000 men able to bear arms; but since the Dutch deprived them of their trade, great numbers have forsaken it; and the other towns and villages, which were proportionably populous, have been greatly deserted for the same reason.

The only principal place on this island, exclusive of the city of Macassar, is the town of Jampandam, which is situated about 15 miles to the south of Macassar river. This was the first place of any importance taken by the Dutch, who have a good fort here; and there is as commodious a harbour as any to be met with in the Indian sea.

There are several islands about the Celebes that go by the same name, the principal of which is situated about five leagues from the south-east corner. This island is about 80 miles long, and 30 broad: on the east side of it is a large town and harbour called Callacassong, the streets of which are spacious, and enclosed on each side with cocoa trees. The inhabitants are Mahometans, speak the Malayan tongue, and are governed by an absolute prince.

On the north-east of this island are the Straights of Patience; so called from the great difficulty in passing them, which arises from the violence of the currents, and the contrary of winds.

CHAP. XXIV.

6. The Island of BORNEO.

THIS is one of the Sunda islands, and is reckoned to be the largest in all Asia, if not in the world, it being at least 2000 miles in circumference. It is situated between seven deg. 30 min. north latitude, and four deg. 10 min. south, under the equinoctial line, which divides it into two unequal parts, seven deg. 30 min. lying northward of it, and four deg. 10 min. southward; so that it is 700 miles in length, and 480 in breadth. It is bounded on the east by the Celebes; on the west by Sumatra; on the north by the Philippines; and on the south by the island of Java.

The air, considering the situation of the country, is tolerable, particularly on those parts next the coast, which are refreshed every morning by cooling breezes from the sea, otherwise the heat would be absolutely insupportable. These parts, however, are very unwholesome, as they lay on a flat for many hundred miles, and are annually overflowed. When the waters retire, a muddy slime is left on the surface of the earth, which the sun shining upon with perpendicular rays, occasions thick fogs, that afterwards turn to rain, with cold chilling winds; so that the air at this time is very unwholesome. Another circumstance that contributes to this is, the great number of frogs and other vermin left on the

mud, which being destroyed by the heat of the sun, produce an intolerable stench.

The dry season begins in April, and continues till September, during which time the wind is easterly between the south coasts of Borneo and the island of Java; but from September to April the winds are westerly, attended by violent storms of rain, thunder, and lightning. These storms are so continual, especially on the south coast, that it is thought very extraordinary to have two hours fair weather in the course of 24.

The produce of this country, exclusive of rice, which is very plentiful, consists of frankincense, musk, aloes, pepper, cinnamon, and other spices; also various kinds of fruits, with excellent mastic, and other gums, wax, cassia, honey, cotton, and the best camphire. Though this last article is principally obtained from the root of the cinnamon tree, which grows in the other spice islands, yet the best in quality is gathered from another tree that is peculiar to this island; for which reason it may not be improper here to describe its nature and qualities.

The camphire is a substance of a very singular nature, distilling from the tree in the manner of gum, and thickening into small grains of different figures and

a very singular na- manner of gum, and different figures and size,

size. It is white in colour, of a bitter taste, and in its smell is penetrating as to be very offensive. If thrown into the fire it will immediately flame, and continue burning till it is totally consumed. It will also burn in water, and the smoke which arises from it will produce a blackish foot. As it consists of high volatile parts, it is very penetrating, disquieting, corroborating, and proper to resist putrefaction. It is the most efficacious diaphoretic known, its great subtilty diffusing it through the substance of the parts almost as soon as the warmth of the stomach has set it in motion. In the courts of eastern princes it is burned with wax to strengthen the light; and the Indians frequently mix it with acrid and aromatic substances, of which they form troches to be chewed, in order to promote discharge of salivation. It is of singular efficacy in inflammations, whether internal or external, and has been found of use against fevers when worn as an amulet. Some put a grain or two of it into a rotten tooth, and even use it as a gargarism in the tooth-ach. If a small quantity of it be boiled in aqua-vitæ in a close place till the whole is evaporated, and then a lighted torch or candle be introduced, the air will immediately catch fire, and appear all in a flame, though no damage will arise either to the room or the spectators. It is said the camphire, when first taken from the tree is red, but that it is afterwards made white either by the sun or by fire. Little of the natural camphire, however, is seen in Europe, the Dutch taking care it shall come refined by sublimation, and ready prepared for our use.

This island likewise produces great quantities of excellent timber, with the cotton shrub, canes, and rattans. In the rivers, particularly that of Succadanea, are found excellent diamonds, and great quantities of gold dust are gathered from the sands.

The load-stone is also found here, and the wild ape produces the richest bezoar stones that are any where to be met with. Here are also mines of iron and tin, which are said to be excellent in their qualities.

The animals of this country are, oxen, buffaloes, horses, deer, and goats; besides which there are several sorts of wild beasts, as elephants, bears, tigers, monkeys, baboons, &c. These last are very numerous, and of different sorts and shapes: but the most distinguished is that species called by the natives *Ouran-outang*, or man of the woods, which Captain Beccman has thus particularly described in his voyage to this island: "They grow, says he, to be six feet high; they walk upright, have longer arms than men, tolerable good faces, (handsomer, I am sure, than some Hottentots that I have seen) large teeth, no tails nor hair, but on those parts where it grows on human bodies: they are very nimble-footed, and mighty strong; they throw great stones, sticks and billets at those persons that offend them. The natives really believe that these were formerly men, but metamorphosed into beasts for their blasphemy. They told me strange stories of them, which I could hardly credit. I bought one out of curiosity for six Spanish dollars; it lived with me seven months, and then died of a flux: he was too young to show me any pranks, therefore I shall only tell you that he was a great thief, and loved strong liquors; for if our backs were turned, he would be at the punch-bowl, and would very often open the brandy case, take out a bottle, drink plentifully, and put it very carefully into its place again. He slept lying along in a human posture with one hand under his head. He could not swim, but I know not whether he might not be capable of being taught. If at any time I was angry with him he would sigh, sob and cry till he found that I was reconciled to him; and though he was but about twelve months old when he died, yet he was stronger than any man in the ship."

Here are parrots and paroquets of various sorts, one of which is called by the Banjarens *luree*, and is greatly admired for its beauty. They have also several other kinds of birds; but not any like those in Europe, except the sparrow. During the time of the western monsoon the sky is frequently darkened with bats, which fly in prodigious numbers: they are called by some Flying Cats, and in colour, shape, and smell much resemble a

fox, though not so large; but their wings, when extended, are not less than six feet from the tip of the one to that of the other.

The rivers and sea-coasts produce great plenty of fish, exclusive of mullets, breams, &c. known in Europe. Among others unknown here is one called the Cockup, which is most delicious in its taste. There is another called the Cat-Fish, which the natives are exceeding fond of: they have large round heads, with bars on the sides like the whiskers of a cat: some of them are six feet long, and are well shaped in the body, but they have not any scales.

The natives of this island are of two sorts, who differ as well in their persons and dress, as in their customs and religion. Those who inhabit the sea-coast are Mahometans, and are called Banjarens, from the town of Banjar, to which most nations resort to purchase the various commodities of the country. The Banjarens are rather low in stature, and of a swarthy complexion, but on the whole very proportionably made. The common people have no other covering to their bodies than a small piece of linen fastened round the waist; but the better sort wear a kind of waistcoat made of silk, or European cloth, over which they throw a loose garment of silk or betella, that reaches to the knees. They also wear a pair of drawers, but have not either shirt, shoes, or stockings. Their hair is tied up in a roll, and covered with a piece of muslin or callico; and when they go abroad, they always carry a dagger with them.

The women are smaller than the men, and their features much more delicate: they are also much fairer in complexion; and, contrary to the mode of most Indian women, walk very upright, and step with a graceful air. They are very constant after marriage, but are apt to bestow favours with great freedom when single; and however indifferent they may have been in this point, they are not considered the worse for it by their husbands, nor dare any one reproach them for the faults they have committed previous to their marriage.

With respect to the disposition of these people, they are naturally quick of apprehension, and very quiet and peaceable till thoroughly provoked; in which case, no other compensation can be admitted than the life of the aggressor, which they obtain with the greatest privacy.

The chief part of their food here, as in other hot countries, is rice; but with it they eat venison, fish, and fowl. The better sort are served in vessels made of gold or silver; but the poorer sort use dishes made of earth or brass. They all sit cross-legged at their meals upon mats or carpets: both sexes chew betel and are, and are very fond of smoking tobacco, with which they often mix opium made into pills, after being boiled in water till it comes to a consistency. The whole company usually smoke out of the same pipe: the master begins, and after having smoked two or three whiffs, he gives it to the person nearest him, from whom it passes round till it comes to the master again. The Chiraks have taught them to game, but this they seldom practise. Their principal diversions are dancing and comedies, which are performed after the manner of the east. Their rural sports are shooting at a mark and hunting. They travel chiefly in the night, on account of the coolness of the air at that time: the common people usually go in covered boats, but the better sort travel by land on elephants and horses.

Their usual salute is the salam, lifting the hands to the head, and bending the body: when they appear before their superiors, they raise their hands above the forehead; and if before a prince, they prostrate themselves on the ground, and retire backwards on their knees.

The inhabitants of the inland parts of this island are taller, and much more robust than the Banjarens. They are called Byajoes, and are Pagans in their religion: their complexion is much more swarthy than the inhabitants of the coast; and their time is chiefly employed in hunting and attending their cattle. They go almost naked, having only a small piece of linen fastened round the waist: they paint their bodies of a bluish colour, and besmear them with stinking oil. Some of them are very fond of having large ears, to obtain which

which they make holes in the soft parts of them when young; to these holes are fastened weights about the breadth of a crown piece, which continually pressing on the ears, expand them to such a length, as to rest upon the shoulders. The better fort pull out their fore teeth, and place artificial ones in their stead made of gold; but their greatest ornament consists of a number of tygers teeth, which are strung together, and worn about the neck.

The Banjarens, in burying their dead, always place the head to the north, and they throw into the grave several kinds of provisions, from a superstitious notion that these may be useful to them in the other world. They fix the place of interment out of the reach of the floods; and the mourners, as in Japan and China, are dressed in white, and carry lighted torches in their hands.

Both Pagans and Mahometans allow a plurality of wives and concubines; and the marriage ceremonies of both are the same as in other Mahometan countries. The girls are generally married at the age of ten, and leave child-bearing before they are 25. They in general live to an advanced age, which is attributed to their frequent use of the water, for both men and women bathe in the rivers once in the day; and from this practice they are prodigious expert in swimming.

The language of those on the coast is the Malayan; but the islanders have a language peculiar to themselves; and both retain most of the superstitious customs of the Chinese.

They know little of physic; and the letting of blood, however desperate the case of the patient, is to them a circumstance of the most alarming nature. An instance of their great timidity on this occasion is thus given by Capt. Beekman, who was under the necessity of submitting to that operation. "One day, says he, being indisposed, I ordered the surgeon to bleed me: Cay Deponattee, and several others of the natives being in the room, and strangers to the operation, were in great amazement to know what we were about, till at length the vein being opened, they saw the blood gush out: on this they were so frightened, that they immediately ran out of the room, crying out, *uran gela atter*, that is, the man's heart or mind is foolish; after which they told us we let out our very souls and lives willingly, which they said was very ill done. To this I answered, that their diet being mean, and their drink only water, they had no occasion for bleeding; but that we who drank so much wine and punch, and fed upon so much flesh, which rendered the blood hot and rich, had an absolute necessity of doing it, otherwise we should be sick. "Aye, says Cay Deponattee, I think that shews you to be full greater fools, in putting yourselves to such expensive charges on purpose to receive pain for it." This was certainly a very true observation, and fully evinced that, if they wanted faith in the utility of this expedient, they were not defective in natural understanding.

They suppose most of their distempers to arise from the malice of some evil demon; and when a person is sick, instead of applying to medicine, they make an entertainment of various kinds of provisions, which they hold under some conspicuous tree in a field; these provisions, which consist of rice, fowls, fish, &c. they offer for the relief of the person afflicted; and if he recovers, they repeat the offering, by way of returning thanks for the blessing received; but if the patient dies, they express their resentment against the spirit by whom he is supposed to have been affected.

They have not the least knowledge of astronomy, and when an eclipse happens, they think the world is going to be destroyed. They likewise know little of arithmetic, and their only method of calculating is by parallel lines and moveable buttons on a board.

Among these people are some of the Chinese, who are the only persons that keep open shops. The commodities they sell consist of chints, calicoes, tea, drugs, china ware, and other articles.

Their current money is dollars, half and quarter dollars; and for small change they have a sort of money made of lead in the form of rings, which are strung on a kind of dry leaf.

The towns and factories to which the Europeans

trade, are built on floats of timber on the rivers; each town consists of one long street; and, to secure them from being carried away by the stream, posts are driven into the ground near the shore, to which they are fastened with cables made of rattans. Each house consists only of one floor divided into different apartments, according to the number in family: the sides of the building are made with split bamboo, and the roof is covered with leaves of trees; the walls are made high for the benefit of the air, and from their tops hang coverings that reach within five feet of the logs, and are made in a sloping form, to keep off the scorching heat of the sun. The floats are made of large logs of wood, and the houses are so light in their construction, that a great part of the float is seen above the surface of the water. The houses of the poorer sort are built on piles of bamboos, in the mud on each side, and are ranged in an uniform manner behind those on the floats. At high water they get to their houses with boats; and when the water is low, they go from one to the other on logs of timber. It sometimes happens, at ebb tides, when the current is excessive strong, that these houses will be removed a considerable distance, and with great difficulty brought back to their original stations. Instances have been known of their being driven to sea, and totally lost.

The principal parts for trade on this island are four, viz. the city of Borneo on the north, Passien on the east, Succadanea on the west, and Banjar Massien on the south. The last of these is the most considerable on account of the river Banjar, which is so commodious as to admit ships of the greatest burthen. This river runs from north to south about half through the island, and towards its mouth is near two miles broad. Its banks are planted with thick groves of evergreens; and one branch of it is called the China river, from the Chinese junks constantly passing it.

About 12 miles up the Banjar river from the sea, formerly stood a considerable town, which was principally frequented for the clove trade. It was near this town that the English established a factory about the year 1700, when the natives, who had their floating houses on the river, retired to Tates, leaving behind them several families of the Chinese and Macassars; and soon after the president of the English factory was deputed governor of the town. This factory, however, continued but a short time; for the Banjarens having received a considerable sum of money from the company for pepper contracted for, refused to deliver the goods; and the English, not being able to obtain redress, abandoned the place. About four years after, the East-India company attempted a second settlement, and the Banjarens seemed desirous of renewing the trade, especially as the English gave them silver for their goods, and made no demand of the money of which they had before been cheated.

The English, in order to secure themselves from future depredations, and to protect the Chinese and other nations that came to trade with them, determined to erect a strong fort: in consequence of which a great number of piles were driven to raise the foundation, and secure it from being damaged by the water. The bricks for this building were made by the Chinese at a place called Tomberneo, about 80 miles to the east of Banjar river, where the English had a house; and the timber was supplied by a Dutchman from the coast of Java. A sad disaster, however, soon befel the prosecution of this work: one of the vessels laden with timber being drove on the coast of Mandava, and the governor understanding for what purpose it was designed, he detained the ship, and caused all the crew, except one man who escaped to Banjar, to be murdered in his presence. When the Banjarens were informed of this circumstance, they immediately destroyed the foundation of the intended fort, attacked the factory, which they burnt entirely to the ground, and obliged the English finally to abandon the country.

There are not any remains of Banjar town now to be seen; for the natives, as before observed, leaving it when the English first settled here, it fell to decay; and the last overthrow of the English produced its total destruction.

struction. Its original inhabitants have ever since resided at Tatas, about six miles higher, to which the Chinese river is navigable, and beyond it the water is deep enough for ships of the greatest burden. The ships that now go from Europe usually lie opposite the place where the English factory stood, which was at the mouth of a smaller channel, called Little Tatas River. The English had likewise a factory at Succadanea, one of the most wholesome parts of the country, and the people the most civilized: this they also quitted, but for what reason is not known.

The inland part of this country is divided into several petty kingdoms, each of which is governed by a rajah, or king. Formerly all the rajahs were subject to the rajah of Borneo, who was esteemed the supreme king over the whole island; but his authority has been of late years greatly diminished; and there are other kings equal, if not more powerful than himself, particularly the king of Caytonge. The town where this prince resides is situated about 80 miles up the Banjar river. His palace is a very elegant building erected on pillars, and is open on all sides. Before the palace is a large building, consisting only of one room, which is set apart for holding councils, and entertaining foreigners. In the centre of the room is the throne, covered with a rich canopy of gold and silver brocade. About the palace are planted several cannon, which are so old, and mounted on such wretched carriages, that they are neither ornamental or useful.

This prince is esteemed the greatest, on account of the customs he receives at the port of Banjar Massien, which are estimated at 8000 pieces of eight per annum.

The most considerable prince next to the above, is the king or sultan of Negaree, whose palace is situated at a place called Metapoor, about 10 miles from Caytonge. Before the gates of his palace is an handsome armoury, which contains a great number of fire-arms, and several cannon. He is always on good terms with his neighbour the prince of Caytonge, and to these two princes the rest are subordinate.

Great homage is paid to these princes by the natives, and it is difficult for a stranger to get access to them: the only means to effect this is by complimenting them with some valuable present, for avarice is their darling passion; and the stranger will be treated with respect in proportion to the present he makes.

"See what money can do: that can change

"Mens manners; alter their conditions!

"O thou powerful metal! what authority

"Is in thee! thou art the key of all mens

"Mouths."

The inhabitants of the mountains live independent of any of these kings: they are divided into different clans under their respective chiefs, and are subject to a government peculiar to themselves. They are seldom seen, as they live in the woods and forests, where they are so secure, that it would be a difficult matter to attack them; and they are so savage, that an attempt would in all probability be attended with the most fatal consequences. Their arms are a dagger, and a trunk about seven feet long, through which they shoot poisoned darts made of brass, and barbed on each side. Their dress consists only of a piece of cloth wrapped round the waist, and a rag about their heads. They often come down to Tatas to get commodities from the Banjarens,

in exchange for which they give gold, bezoar, rice, wax, &c.

The Dutch possess the principal parts on the coast of this island, and are masters of the best ports, and most valuable articles in traffic; but there are many creeks about the island, where others have free commerce without molestation. And as this country produces a great variety of articles, whose value are more estimable to other nations than to the Dutch, so numbers of foreigners resort here for those commodities that are best adapted to the trade of their own nation. The Chinese and Japanese come here for spices; the Malaysans for gold; and those from the Mogul country, in search of diamonds. As the Dutch reckon the pepper, cloves, and cinnamon inferior to those of other spice islands, so they suffer them to be sold without interruption. The natives are supplied by the Dutch with the manufactures of India; in exchange for which they receive gold, diamonds, and other valuable commodities.

The principal articles purchased here by the English merchants are, pepper, gold, precious stones, and a gum called dragon's blood, which is said to be finer here than in any other part of the world. They buy it in drops about an inch long, and the price is about 40 dollars for a pecul, which in weight is 132lb. They likewise buy Jambee canes for about four dollars per hundred; and the fine monkey bezoar for about five times its weight in silver.

The goods the Europeans carry there consist of guns, pistols, gunpowder, sheet lead, iron, and steel bars, nails of different sizes, hangers, knives, and other cutlery wares, boots made of red leather, spectacles, looking-glasses, clock-work, callimancoes, and various sorts of linens.

Borneo, the capital city, is situated at the north-west corner of the island; and lies in 112 deg. two min. east longitude, and in 4 deg. 55 min. north latitude. On the east side of it is an excellent harbour, adjoining to which is a large river, capable of accommodating ships of the greatest burthen. The town is very large, the streets spacious, and the houses well built: they are in general three stories high, covered with flat roofs, and the sultan's palace is a very elegant and extensive building.

This city is the chief seat of commerce in the island, and the port belonging to it is continually crowded with ships from various nations, particularly from China, Cambodia, Siam, and Malacca; and there are prodigious numbers of boats that come from the Philippine and other islands. The Dutch import here glass, cinabar, cloths, woollens, and iron; in exchange for which they take camphire, gold, and precious stones. The Portuguese and English have some trade here, though no settled factory; but there are merchants of both nations who correspond with the company's factors on the coast of Coromandel.

Before we quit this chapter, it may not be improper to observe, that those who barter with the natives of Borneo, must carefully examine the goods they purchase, and see that the weight or measure is just; for they are errant cheats; and such strangers are they to any remorse of conscience, that he thinks himself the most ingenious, who commits the most distinguished fraud. They make compositions to imitate some of the most valuable articles, particularly bezoar and bars of gold, the latter of which is so artfully executed, that unless a penetration is made entirely through them, the deception cannot be discovered.

CHAP. XXV.

7. The SPICE ISLANDS, OF MOLUCCAS.

THE Moluccas lie between five deg. north, and seven deg. fourth latitude; and from 121 to 130 deg. east long. The principal of them are,

The Banda islands	Banda	All these produce nutmegs, &c.
	Puloway	
	Pulorin	
	Nera	
	Gumanapi	
Ternate Tidore, or Tidor Motir Machian Bachian Amboyna Bouro Ceram Gilolo Bouton	Gulilaen	Most of these produce cloves, &c.

The spices of these islands were known to the Europeans long before the passage to the East Indies by the way of the Cape of Good Hope had been found out, being brought to the Mediterranean by the way of the Red Sea, or sometimes through Persia and Turkey. But the Portuguese discovering the beforementioned passage, and penetrating to these islands in 1511, the emperor Charles V. claimed them as his own; but the Portuguese would not give them up: they were, however, driven out by the Dutch, who are at present in possession of them. Cloves and nutmegs are not produced in any other part of the universe, and the polite Dutch destroy great quantities annually, in order to keep up the price, and not glut the markets.

The nutmeg resembles a peach, and the clove a laurel tree, only the leaves are smaller than either: the fruit of the former is both nutmeg and mace, the nutmeg being the kernel, and the mace a kind of leaf that incloses the nutmeg-shell, and the whole is contained in a large coat like that of a walnut: but the cloves appear in clusters; the blossom changes gradually from white to green, red and brown, which latter is the characteristic of its ripeness; but when it is dried in the sun, it receives a blackish hue. The clove is gathered from September to February, and the nutmeg in April, August, and December. The April crop is, however, deemed the best; and the nutmegs, when gathered, are boiled in lime to prevent their being worm-eaten.

1. The Banda Islands, or those which produce the nutmegs, lie near each other. Banda, the principal of them, is about 20 miles long, and 10 broad. Besides the large forests of nutmeg and clove trees which grow spontaneously, and require not the least trouble, the soil is fertile in a variety of delicious fruits. The island is in the shape of a crescent, and the concavity of it forms an excellent bay, near which the principal town stands. Several brooks flow from a small mountain, water the whole country, and render it exceedingly pleasant.

"In wanton tides the wreathing volumes flow,
"Still forming reedy islands as they go;
"In smooth meanders to the neighbouring main,
"Each liquid serpent draws its silver train."

The natives are strong in their persons, disagreeable in their features, malicious in their temper, and melancholy in their dispositions: the Dutch say,

They are ugly and strong,
And bear malice long.

The island is divided into three districts; the religions are Mahometanism and Paganism. The natives have ships of some force, containing a few cannon in each, and use bucklers, back and breast plates as defensive, and carbines, darts, lances, scymetars, &c. as offensive weapons. The men are very idle, and oblige the women not only to do all the domestic drudgery, but to cultivate the land. They have three harvests in the year, but make fruit a principal part of their diet.

At the western part of the island the Dutch have a fort, which is erected upon the top of a mountain, and ascended to by 324 stone steps. At the foot of the mountain stands a negro town, the principal factory of the Dutch being at Nera, which is well fortified, as are all the landing places in the island; and the whole under the direction and superintendence of a governor and council.

The following articles are imported into this and the other Banda islands; gold chains, gold coins, enamelled and damasked sword blades, silver cups gilt, guns, china ware; broad cloth, velvets, damasks, flannels, &c. &c. The exports are spices and fruit.

Nothing can be said of the other Little Banda island, but what is included in the above general description of Banda.

2. Ternate is not above 24 miles in circumference; but though inferior in size to some of the other Moluccas, it is deemed the principal both by the Dutch and natives, as the Dutch make it the head seat of their government, and the chief prince of these islands the place of his residence.

This island produces cloves in great abundance, admirable almonds, delicious fruits, a few goats, and some poultry, but not rice or any other grain; for the excessive heat which is requisite to ripen spices, and moderate fruit, parches the earth so as to render it incapable of bearing wheat, barley, or rice: for here the sun is seen in all his splendour and power, and his influence is so greatly felt, that his rays penetrate through the pores of the earth, and warm the soil to a considerable depth beneath the surface:

"For like a giant strong, or bridegroom gay,
"The sun springs dancing through the gates of day;
"He shakes his dewy locks, and hurls his beams
"O'er the proud hills, and warms the eastern streams:
"His fiery couriers bound above the main,
"And whirl the car along th' eternal plain;
"The fiery couriers, and the car display
"A stream of glory, and a flood of day."

The want of the various kinds of grain commonly used in bread, is not, however, felt by the natives; for they have a substitute, which makes the most wholesome and exquisite cakes in the universe, that is, the pith of a tree called Sago, whose glutinous qualities are well-known in Europe. This excellent tree is not only of utility with respect to its medicinal virtues, and for yielding them bread; but it affords them likewise drink, clothing, and shelter; for by incision a liquor is drawn from it that exceeds most wines; the leaves being a kind of cotton, the smaller are converted into garments, and the larger used to thatch their houses. This bread contributes to the longevity of the natives, most of whom live to an 100 years of age.

The king is the chief of all the Moluccas, receiving tribute from every one of the islands. The natives

struggled

struggled against the encroachments of foreigners many years, but were totally subdued by the Dutch in 1680; and the latter have at present so many forts, and such strong garrisons, that the former do not entertain the least idea of driving them from their country.

The generality of the natives houses are built of cane; some few of the better sort, indeed, have wooden houses. With respect to their furniture, a mat serves them instead of bed, chair, and table; for they lie on it, eat and drink on it, and sit on it. This, and a pot to dress their victuals, a hatchet to cut their wood, and a calabash to hold their water, make the whole catalogue of their household utensils: their windows are not glazed, nor are their doors secured by locks. They wear silk or callico, and all persons make their own garments, the king and grandees excepted. Their fuel is odoriferous woods, and even their smiths use nothing in their forges but almond shells. The king resides at Malaya, a little town fortified with a mud wall; but the suburbs, in which the Dutch factory have a fine garden, is pretty large, and well inhabited by blacks. The palace is but a trivial building, but the gardens belonging to it are very pleasant, and contain an aviary filled with a great variety of beautiful birds, whose harmonious notes are delightful to the ear.

This prince has a cabinet of Indian rarities, and European curiosities; he is attended by a considerable retinue, and wears a sumptuous garment of Dutch manufacture.

The waters in this island are remarkably clear, and the fish extremely delicious:

- "No swelling inundations hit the grounds,
- "But chrysal currents glide within their bounds:
- "The finny brood their wonted haunts forsake,
- "Flout in the fun, and swim along the lake;
- "With frequent leaps they range the shallow streams,
- "Their silver coats reflect the dazzling beams;
- "The plenteous streams a various race supply,
- "The bright-eyed perch with fins of Tyrian dye;
- "The silver eel in flowing volumes roll'd,
- "The yellow carp with scales bedopp'd with gold;
- "Swift trouts diversify'd with crimson flames,
- "And pikes, the tyrants of the wat'ry plains."

Ternate produces parrots, which are handsomer and speak more distinctly than those of the West-Indies; but the most remarkable of the feathered race in this island is the bird of paradise, which is justly deemed the most beautiful bird in the universe. The head is like that of a swallow, but the bill considerably longer; the body is small, but the plumage displays such admirable colours, as are inconceivably pleasing to behold.

There is a volcano in this island, which casts out a sulphureous fire three months in the year, and sometimes does great mischief, which was the case in the year 1648, when it destroyed many houses, and did other considerable damage; and we have this recent account of its dreadful devastations in a letter from a merchant at Batavia, dated Oct. 18, 1776.

"We have the following account of the deplorable situation of the island of Ternate."

"On the 4th of July 1775, there were more than 100 shocks of earthquakes felt here, some of which were so violent that they seemed to threaten the destruction of the whole island; about the 20th of August they were felt again, and the burning mountain after a dreadful explosion, threw out hot stones, cinders, and lava in abundance; and on the 5th of November the earth was never still for three hours, the mountain seemed all on fire, and the most dreadful storm of thunder and lightning fell in every part of the island, which threw the inhabitants into such a consternation, that they run from one part to another for shelter; but none was to be found, the sea was so extremely boisterous that the destruction was inevitable there, and on the land the earth opened and trembled under them, as if the whole island was going to be annihilated; but by the providence of the Almighty, a calm was restored, and the inhabitants had time to see what damage had been done, when it appeared that the Dutch settlement had suffered but little; but it will be some years before the Islanders

recover their loss. The king has made a report, that a large track of land on the north side of the island, in the district of Xulla Tacory, has been swallowed up, by which 16 plantations have been totally destroyed, and 141 persons have been either burnt, or drowned in the sea, where many of them took refuge in their boats. This report has been confirmed by about 30 of the unfortunate inhabitants, who are rendered dreadful objects by wounds and burns in this shocking event. On the 5th and 6th of November, the earthquakes, and effusions of fire, stone, and sulphureous smoke from the mountains began as bad as ever, but no lives were lost. The horrors of this night are not to be described, for the thunder, lightning, and most shocking earthquakes continued without interruption for 12 hours, with the most terrible violence; from this ever dreadfully to be remembered night, there were no more earthquakes till July 1, 1776, when they were again felt for two hours, but not violent."

3. Tidore lies to the south-east; the capital, which is of the same name, has been strongly fortified by the Dutch; so that on account of its natural strength, and the important works they have added to it, the place is deemed impregnable; the harbour is however, but indifferent, being dry at low water, which sometimes proves very inconvenient to the merchants.

4. Motir, a very small island, about 30 miles north of the line, is secured by a strong Dutch fortress.

5. Machian stands to the south of Motir, and is nearly under the line; it rises in a conical form to a considerable height, and seems at a distance like a single mountain. The cloves of this island and Tidore are superior to those of any other of the Moluccas. In this island, which is only 20 miles in circuit, the Dutch have several forts.

6. Bacchan, Great and Little, are to the southward of the Line, the first is fertile in fruit, figs, fish, &c. It formerly produced cloves, but the Dutch ordered them to be grubbed up to prevent their becoming too plentiful. It has a good harbour, defended by a strong fort; but there is nothing respecting Little Bacchan which is worthy of mention.

The above are the Molucca islands, properly so called; but as those which follow produce the same kind of spices they are included under the same general appellation.

7. Amboyna, which is better than 70 miles to the northward of Band 1, is about 72 miles in circumference, and lies in 3 deg. 8 min. south lat. and 127 deg. 10 min. east long. It contains at present above 50 protestant churches, and many of the natives, who have been sent over to Holland for education, officiate as clergymen and missionaries, by which means proselytes are exceeding numerous. The soil is very fertile, producing in abundance nutmegs, cloves, oranges, lemons, citrons, potatoes, millet, tobacco, sugar, bamboos, &c. but the air is unwholesome; there is a good bay, which penetrates very far into the land, and by that means forms a commodious harbour. The people extract a spirituous liquor, and a kind of oil from green cloves, which are both good in paralytic cases. The men wear only a piece of cloth about their waists, and are mighty proud of having large whippers; they purchase their wives, but in case of barrenness divorce them. The women are both of a loose, and of a malicious disposition; on account of the earthquakes the houses are all built very low. The strong and important fortress called Fort Victory, is the staple of the Dutch East-India company in these parts. It is defended by four bulwarks, a broad ditch, and a garrison of 800 men. The English had formerly factories here as well as the Dutch; but in 1623 the latter massacred the former, and usurped the dominion of the Spice Islands, which had been ceded to the English by the natives themselves. In putting the English and some Japanese to death they used the most horrid cruelties, in order to extort confessions concerning a pretended plot, which they accused them of having formed; and to the shame of king James I. and king Charles I. no satisfaction was obtained for the villainous barbarity; Oliver Cromwell was not, however, so easy about the matter, for he frightened

Moluccas, receiving
lands. The natives
struggled

frightened the Dutch into the payment of 300,000 l. as some kind of retribution. There are several populous villages in the island, in the churches and chapels of which religious service is performed both in the Dutch and Malayan tongues; it contains likewise many mountains with springs of water on their summits.

8. Bouru, in 2 deg. 30 min. south lat. and 125 deg. 30 min. east long. is about 75 miles in length, and 30 in breadth. The Dutch have here a strong fort, though the island is perfectly secure from the singularity of its coast, which rises in a high ridge, and encompasses the whole as with a wall. It contains some prodigious high mountains, but is nevertheless very fertile, producing cloves, nutmegs, cocoa-trees, bananas, plantain, green-ebony, beans, peas, potatoes, tobacco, Indian wheat, lime-trees, herbs, flowers, &c. Among the beasts are the civet-cat and a singular kind of roe-buck, whose flesh is very delicate. The natives are black, and go entirely naked till they are 12 years of age; at which period they tie a piece of cloth round their waists, and never wear any other garment. They are Mahometans and Pagans, but upon the whole have very little sense of religion. When a relation dies, they appear very sad till the corpse is in the ground, and then they seem merry to an excess; but do not forget to make a kind of sepulchre of stone and clay to cover the grave of the deceased. The next day after the women are delivered of children in this island, they go about their ordinary work, while the men indulge themselves in

bed, and pretend to be vastly ill. Instead of a cradle they put their infants in a kind of net-work hammock, which they hang upon a peg whenever they are too busy to dandle it in their arms.

9. Ceram is in 2 deg. 30 min. south lat. and in 127 east long. and produces cloves and nutmegs, but is woody and mountainous. The Dutch factory, called Amfay, is defended by a strong fort and good garrison; the inhabitants, who are Pagans and Mahometans, own the king of Ternate as their sovereign, though they have a prince of their own who dwells at Cambello.

10. Gilolo extends from one deg. south to two deg. north lat. and from 125 to 128 east long. and is 190 miles long, and 110 broad; the air is unhealthy, and the soil produces rice and sago, but no spices. The inhabitants are strong and tall, but barbarous and cruel, and have an independent sovereign of their own.

11. Bouton lies between 4 and 5 deg. south lat. and in 121 deg. 30 min. east long. It is 75 miles in length, 30 in breadth, has a good harbour, and contains a large town with tolerable houses, built in the manner of those of Mindanao: this town is inclosed by a stone wall, and surrounded by groves of cocoa-trees. The natives are governed by a prince of their own, speak the Malayan language, and profess the Mahometan religion.

Many writers have included New Guinea among the Moluccas, which is a glaring absurdity that we hope all future geographers will avoid it.

CHAP. XXVI.

8. The ISLAND of JAVA.

THIS island is situated between 102 and 113 deg. east longitude, and between 5 and 8 deg. of south lat. being about 700 miles in length, 200 in breadth, and upwards of 900 in circumference. It is bounded on the east by the island and straits of Bally, on the west by the straits of Sunda (from whence it is called one of the Sunda Islands); on the north by the island of Borneo; and on the south, by the Indian ocean.

The air of this island is in general very wholesome, and the country exceeding fertile, and beautifully diversified. A chain of mountains runs through the center of it that are seen at a considerable distance from sea. The most distinguished among those is one called the Blue Mountain, which is covered with woods and groves of the cocoa-nut. It is said these mountains produce great quantities of gold, but that the natives take particular care to conceal it from the Europeans.

The most distinguished production for which this island is famous, is the cocoa-nut, which grows here in great abundance, and is said to be superior to any in the Indies. This fruit the natives eat at their meals in the same manner as we do bread; and they extract a liquor from it which they use in sauces, and which is also efficacious in medicinal cases. Besides this the cocoa-nut produces another liquor that is very cool and pleasant, and in taste is somewhat like water sweetened with sugar. The trunk also produces a third kind of liquor, which the natives call *sura*, and the Europeans palm wine, from the cocoa being a species of that plant. This liquor is very strong, so that when the natives use it they mix it with some of the water that runs from the nut. The tree on which this fruit grows is large and frait, thick at the bottom, and taper at top. The nuts hang in clusters on the branches, joined by a tendril something like that of the vine. The branches, which grow near the top of the tree, shoot out at different periods, so that the fruit is in three

stages at the same time, some of it being only in blossom, some green, and others quite ripe. The nut is covered with two rinds, the outermost of which consists of long tough threads, and is of a reddish colour: the inner rind is of a brown colour, and very hard. The nut within is about an inch thick, very solid, and in taste resembles an almond. Travellers say that the age of this tree may be always known, from a circle that annually grows round its trunk. Likewise, that when a child is born the parents plant a cocoa-tree, and if any person asks their age, the father refers them to his cocoa-trees, which on this occasion are numbered according to the birth of the children.

Besides the advantages already mentioned, the cocoa-tree produces good timber for building, and the branches are used for covering the houses. The bark is also of great service, for the natives reduce it into threads, and make good cordage of it for the use of their shipping. The other fruits produced on this island are, plantains, bananas, ananas, mangos, durians, oranges of several sorts, limes, lemons, betel and areka nuts.

Rice is the only grain that grows here, but they have great plenty of vegetables, as cabbages, lettuce, parsley, fennel, melon, pumpions, potatoes, cucumbers and radishes. They have likewise considerable plantations of sugar, tobacco and coffee.

The animals of this country are, oxen, horses, sheep, hogs, and deer. The flesh of the hogs is sweet, and the venison excellent; but the mutton is small and very dry. They have likewise plenty of fowls that are exceeding good, particularly peacocks, partridges, pheasants and wood-pigeons: and the rivers produce various sorts of fish. In the woods and forests are great numbers of wild beasts, as buffaloes, tigers, rhinoceroses, monkeys of various kinds, and wild horses: and there are also prodigious numbers of serpents, some of which are of a very extraordinary size. There are likewise many flying reptiles, and a remarkable animal

called Jackos; it is almost like a lizard, is very malicious, and discharges its urine at every thing that offends it: the urine is of such a quality, that it will canker the flesh, and if the part is not immediately cut out, the object on which it falls must infallibly perish. Few accidents, however, happen from this creature, as it always gives notice of its situation from the singularity of its voice, so that animals as well as the natives have an opportunity of escaping it.

The island of Java is divided into several kingdoms and principalities, all of which were formerly under the government of their respective princes. At this time, however, it may be considered as consisting only of two parts, viz. The north coast, which is under the dominion of the Dutch; and the south coast, which is subject to the kings of Palamboan and Mataram. The English had formerly possessions here, but they were ousted by the Dutch in the reign of James II. and the latter may now be said to be chief masters of this extensive country.

The natives of this island are descendants of the ancient Chinese. They are in general very robust, of a brown complexion, have large eye-brows, flat faces, broad cheeks, and wear their own hair, which is short and black. The women wear as much hair as can grow upon the head, and to increase the quantity they use oils, and other preparations. It is formed into a kind of circular wreath upon the top of the head, surrounded with another of flowers, and the whole is fastened in very elegant taste by a bodkin. The men wear a piece of cloth wound several times round the waist; and the women have a garment much of the same nature, which reaches from the shoulders to the knees. Those on the coast are Mahometans, but the rest are Pagans. The women are very constant, and pay a particular respect to their husbands; but they are naturally indolent, proud and revengeful. Polygamy is here allowed, but if the husband is found guilty of infidelity, the wives can very easily obtain a divorce.

The most distinguished solemnity amongst them is a wedding, on which occasion both the families borrow as many ornaments of gold and silver as they can, to adorn the bride and bridegroom, so that their dresses are very showy and magnificent. Among the better sort the feasts given on these occasions last sometimes a fortnight, and sometimes longer, during which time the man, although married the first day, is kept by the women from his wife; nor will they even suffer them to speak to each other till the ceremony of feasting is over.

They carry on a considerable trade from one port to another, particularly to the island of Borneo, where they get diamonds, which they dispose of to the Dutch in exchange for other commodities.

The general trade, however, of this island is principally in the hands of the Dutch, as are also the chief productions of the country; and the natives cannot be considered in any other light than as their subjects; for they not only condescend to trade with them, but bring their commodities, especially pepper, to Batavia, where the Dutch buy it ready cured, so that they have not any trouble in preparing it for sale.

The Dutch have prodigious numbers of sugar canes in this country, especially about Batavia; so that they not only supply the colony, and the factories in the Spice Islands with this article, but they also send great quantities of it annually to Holland. They have likewise large plantations of coffee, which, though not equal in quality to that of Mocha, is yet exceeding good, and they send considerable quantities of it every year to Europe.

Bantam, which was once the metropolis of a great kingdom, is the principal place of commerce at the western part of this island. It stands in a plain at the foot of a mountain, from whence issues a river that divides itself into three streams, one of which runs through the town, and the others surround it. It is 12 miles in circumference, and before it was reduced by the treachery of the Dutch, (who first joined the natives against their king, and then stripped the latter of all regal power) was very populous, well fortified, and adorned

with several elegant buildings and palaces. At this time, however, it is a very ruinous place, inhabited only by the poorest people. The houses stand on piles, and are built with reeds and canes; and there are only three principal streets in the city, through which run channels of the most filthy water. It has, however, a very pleasant bay, and round it are several small islands that retain the names given to them by the English when they traded in this country.

The most distinguished city now in this island, and indeed the most important of all the European settlements in the Indies, is BATAVIA, which is built on the ruins of the ancient capital of Jacatra.

This opulent city is situated about 40 miles east of Bantam, on a fine bay of the sea, in 16 deg. east long. and 6 deg. of south lat. The bay in which it lies extends east as far as the cape of Karovant, and west as far as Rough Point towards Bantam. It is called by the Indians Jacatra, and by the natives and Chinese, Calacka or Calappa, the name they give to the cocoa, the principal and esteemed fruit of the country.

At the time the Dutch first came to this place, which was in the year 1619, it was in a very insignificant state, being surrounded with watery and fenny grounds, and subject to great inundations from a river that ran through it: but the Dutch thinking this spot the most advantageous for their trade on the island, demolished the old town, and after cutting canals and drains to carry off the water, they erected the present city, which they called Batavia, and which has ever since been their capital seat of commerce in the Indies.

The port belonging to it is exceeding safe and commodious, there being several small islands round it, which so break off the violence of the winds and waves, that 1000 sail of ships may ride in it with the greatest security. At the mouth of the river that joins the bay from the town is a boom that runs across it, which is every night guarded by a detachment of soldiers, and at this place all vessels pay toll. A very considerable advantage peculiar to this harbour arises from the north and south winds, the former of which blow in the morning to bring in vessels, and the latter in the evening to carry them out.

The city of Batavia is divided into two parts by a river: it is of a square form, and is supposed to be larger than any city in England, London excepted. It is very uniformly built, and the houses in general are of stone. The streets are spacious, and in the most distinguished of them are canals faced with stone, and planted on each side with evergreens: there are upwards of 50 stone bridges over these canals, besides draw-bridges and others made of wood. The streets in general are about 30 feet broad, and paved on each side with brick, which is raised above the highway for the convenience and safety of foot passengers.

The houses are plain but very neat, and behind them are large gardens well stocked with garden stuff, and most kinds of fruit. The public edifices in general are very magnificent, particularly the governor's house, which, though only two stories high, is yet very lofty, and may be seen a great distance at sea. Other distinguished buildings here are, the great church, the stad-house, the orphan's hospital, the house of artisans, the spin-house, or house of correction, the pest-house, and the Chinese hospital for sick and aged people. Here are also two churches, one for the use of the reformed Portuguese, and the other for the Malaysians; but Papists and Lutherans are prohibited from exercising their modes of worship.

In the center of the city is a large square, used as a parade for the garrison. On the west side of this square stands the great church, on the south side is the stad-house, on the north is a range of very elegant buildings, and on the east is a large canal shaded on each side with lofty trees.

This city has four handsome gates, two on each side the river; and it is encompassed with a strong rampart faced with stone, and fortified with 24 bastions furnished with cannon, so planted as to be of equal service either against an insurrection or an invasion. On the west side of the city is a large castle made in the form of a quadrangle,

quadrangle, which commands both the city and road. It has four handsome bastions faced with stone, and four gates, one of which is called the land-gate, where there is a stone bridge with 14 arches, the center one of which is of a different form, and much larger than the others. Within the boundaries of the castle are several elegant buildings, particularly the house of the governor-general; and here are likewise apartments for most of the principal officers belonging to the company. In the castle are likewise arsenals and magazines well supplied with all kinds of ammunition; and here all the affairs of the company are transacted.

Besides the fortifications already mentioned, there are five very strong forts situated at some distance from the city, as a defence against any attempt that might be made by the natives, and to secure their respective manufactures, particularly their powder-mills, sugar-mills, corn-mills, &c. In short, the Dutch have erected so many fortifications and other works for the use of the factory, that they could subsist here without having any intercourse with Europe; and if occasion should require it, would be able to defend themselves against a very powerful enemy; for in the islands of Ormus and Onoilt, two leagues from the city, they have yards and docks for ships, with plenty of timber and all other materials; a large rope-walk, forges for anchors, &c. and foundries for iron and brass cannon, mortars, bombs, shells, bullets, &c.

The number of regular troops with which the city and forts are garrisoned amount to between 10 and 12000, 1000 of which are constantly kept on guard.

The suburbs of the city of Batavia are very extensive, and their situation delightful. The whole country is interspersed with beautiful villas, plantations that yield an agreeable shade, and gardens well laid out and finely ornamented. The better sort of people reside most part of the year in the suburbs, and those in office only go occasionally to Batavia as business requires their attendance.

The inhabitants of the city and suburbs of Batavia are formed of various nations, who all preserve the dresses, modes and customs of their respective countries. This motley group has a very strange appearance, the idea of which will be best conveyed to the reader, by giving some particulars relative to each.

The *Javanese*, or natives of the country, who reside in a particular quarter of the suburbs, are chiefly employed in husbandry, building of boats, or fishing. The men are of a tawny complexion, and wear only a garment made of callico, which reaches from the waist to the ancles. The women are much fairer than the men, and have good features: they cover their bodies with a piece of silk or callico, under which is another piece tied round the waist, and formed like a petticoat. The women dress their hair, and the men wear a kind of skull-cap; but both sexes go without shoes or stockings. Their houses are built of split bamboo, with a spreading roof that extends on each side to keep off the violent heat of the sun; and are much superior in neatness to those of other Indians. They live very abstemiously, their food consisting of rice, fruits, and dried fish, and their general drink is either pure water or very weak tea.

The *Chinese*, who are very numerous here, are not only the greatest retailers of most commodities, but many of them are excellent mechanics. They chiefly employ their time in husbandry and gardening, and farm the fishery, excise and customs. They pay a tax to the Dutch for permission to wear their hair, which is generally done up in a roll, and fastened to the hinder part of the head with bodkins of gold or silver. The distillers of arrack are chiefly Chinese, who pay 50 reals excise for ever cauldron they make. However, they receive some privileges from the company; for they have not only a Chinese governor who manages their affairs, but they are also allowed a representative in the council. They bring tea and porcelain hither from China; but those who are employed for this purpose must not continue on the island longer than six months. The dress and customs of the Chinese here are the same as in China, which have already been described in our account

of that country: but they have singular maxims in the interment of their dead; for they will never open the same grave where any one has been buried: their burial-grounds, therefore, in the neighbourhood of Batavia, cover a prodigious space of ground, and the Dutch take the advantage of them by making them pay large sums for ground for this purpose. In order to preserve the body, they make the coffin of very thick wood, not with planks fastened together, but cut out of a solid piece like a canoe; the coffin being covered and put into the grave is surrounded with a kind of mortar about eight inches thick, which in time becomes as hard as stone. The relations of the deceased not only attend the funeral, but also a great number of weeping women, who are hired on these occasions. In Batavia the law requires that every man should be buried according to his rank; so that if the deceased has not left money sufficient to pay his funeral expences, an officer takes an inventory of his goods, which are sold, and out of the produce he buries him in the manner prescribed.

The *Dutch* are the greatest merchants here, and are also very good mechanics: they keep the chief inns and places of public entertainment; but they are far from being obliging to their guests, and particularly to foreigners. They pay two reals a month for their licence, and 70 for every pipe they sell of Spanish wine.

The *Portuguese* here are very numerous, and in order to distinguish them from other Europeans, they are called by the natives *Oranferante*, or *Nazareen* men. They in general speak the Malayan language, but some of them a corrupt dialect of the Portuguese; and they have all renounced their religion, by professing the principles of Luther. They are chiefly employed in the most servile offices: some of them are handicraftsmen, others get their living by hunting, and the greater number by washing linen. They have so closely followed the customs and manners of the Indians, that they are only distinguished from them by their features and complexion, their skin being considerably lighter, and their noses not so flat; and the only difference in their dress consists in the manner of adjusting their hair.

The *Malayans*, who reside here, are of a very tawny complexion: they wear a short coat with strait sleeves, and a cloth fastened round the middle. The women wear a waistcoat, over which is a cloth that reaches from the waist to the ancles; but neither sex have any other covering to their head than their hair; nor do they wear either shoes or stockings. The men are chiefly employed in fishing, but some of them are retail traders, though greatly inferior to the Chinese. They profess the Mahometan religion; but they are naturally very profligate, and will not hesitate to commit the most infamous crimes.

The *Amboynese* are a very bold and desperate people, and for that reason are not permitted to reside in the city, but live together in one quarter of the suburbs. They are under subjection to a chief, who always resides with them, and has a magnificent house furnished after the manner of their country. The men go almost naked, having only a piece of cloth fastened round the waist, and a kind of turban on their heads made of cotton. The women wear a habit that fits very close to the body, and they have a mantle hanging loose over their shoulders. Their houses are made of wood, and covered with branches of trees; they are pretty lofty, and the floors are divided into separate apartments; so that one house will contain several families. The men are chiefly carpenters; but some of them belong to the Dutch troops, and are much valued for their natural courage and intrepidity.

The *Topasse*, or *Mondikers*, are a mixture of Indian and other nations, and have much greater privileges here than the rest. Many of them are considerable merchants, and have handsome houses; some of them are tolerable good mechanics; and the lower sort are chiefly employed in husbandry and gardening. They differ very little from the Dutch in their dress or method of living, only the men wear large breeches or trowsers that reach down to their ancles. The women wear a waistcoat

and a piece of callico round the waist, but they have not any covering on their heads except the hair, which is tied up in a roll. These people reside both in the city and suburbs: their houses are several stories high, built of brick or stone, and the insides very neatly furnished.

The *Beguis* are some of the descendants of the ancient inhabitants of Macassar and the neighbouring islands. These have their quarters in the suburbs, and being, like the Amboynese, very hardy and bold, many of them are employed in the service of the army. Their usual weapons are bows and arrows; and some of them have sabres and bucklers. In their own country they generally go naked, but here they wear a very decent dress, and are particularly fond of ornamenting their hair.

The *Timoreans* were formerly inhabitants of an island to the east of China, but were brought to this place by the Dutch. These people were originally Pagans, but many of them have turned Christians or Mahometans. The habits and customs of these people are much the same as those of the Macassars; and their chief employment consists in husbandry and gardening.

The *Negrees* here are chiefly Mahometans. Some of them are pedlars, and hawk about the streets glass beads and coral; others follow mechanical trades; but the most considerable of them deal in free-stone, which they bring from the neighbouring islands.

Such is the mixture of people that constitute the inhabitants of this city and its suburbs; and notwithstanding the great difference of their customs, manners, dress and religion, yet they preserve an unanimity that can only be attributed to their anxious pursuit after commerce, which seems to inspire their souls with one universal sensation.

- "Thus, while around the wave-subjected foil
- "Impels the native to repeated toil,
- "Industrious habits in each bosom reign,
- "And industry begets a love of gain.
- "Hence all the good from opulence that springs,
- "With all those ills superfluous treasure brings
- "Are here display'd. Their much-lov'd wealth
- imparts
- "Convenience, plenty, elegance and arts;
- "But view them closer, craft and fraud appear,
- "E'en liberty itself is barded here.
- "At gold's superior charms all freedom flies,
- "The needy sell it, and the rich man buys.
- "A land of tyrants, and a den of slaves,
- "Here wretches seek dishonourable graves;
- "And calmly bent, to servitude conform,
- "Dull as their lakes that slumber in the storm."

As the principal part of these people are composed of different Indian nations, so the chief Indian languages are here spoken; but the most universal are the Malay and the Portuguese.

All the inhabitants enjoy liberty of conscience; but they are not allowed to exercise their respective modes of worship. Priests and monks are permitted to live here, but they are prohibited from being publicly seen in the respective habits of their priestly orders.

The Dutch have founded several schools in Batavia for teaching the learned languages; and most mechanic arts are brought to great perfection. They have a printing-house, paper-mills, and powder-mills; and among the handicrafts are, sugar-bakers, cotton-weavers, carpenters, rope-makers, bricklayers, shipwrights, smiths, braziers, cutlers, &c.

Batavia being the great emporium of the Dutch East-India company, they import here not only the productions of Europe, but also the merchandize of Japan, the Spice Islands, Persia, Surat, Bengal, the coasts of Malabar and Comorandell, &c. Though they will not permit any Europeans to trade here, yet a number of Chinese junks, from 300 to 500 tons burthen, arrive once a year, by means of which they are furnished with the commodities of China without being at the expence and inconvenience of sending their own ships for those necessary and profitable articles.

In the city of Batavia are held the two grand councils, that govern all the dominions belonging to the Dutch in the East-Indies. These are distinguished by

different appellations: the first is called the Council of the Indies, who direct all public matters relative to government: the other is called the Council of Justice, in whom are invested the administration of justice to all parties. The highest of these two assemblies is composed of 18 or 20 persons, called councillors, and the governor-general is always president. They usually assemble twice a week, or oftener if called upon by their president; and their general business is to deliberate on such measures as may be most conducive to the interest of the company.

The governor-general has the power of, and lives with a dignity equal to, a sovereign prince. He receives all the Indian kings and their ambassadors, many of whom come annually to Batavia. When he goes abroad, his coach is preceded by a troop of horseguards; on each side walk a body of halberdiers, and the rear is closed by a company of foot soldiers. The dress of his guards is exceeding handsome, and the whole forms a very brilliant and grand procession. His lady has likewise her proper attendants, and when in public, appears with a dignity not inferior to that of a queen.

The most considerable officer here, next to the governor, is the director-general, whose business is to purchase such commodities as are brought to the port, and to dispose of such as are taken from it. He is sole master of all the magazines, and has the supreme direction of every thing that relates to the commercial interest of the company.

As Batavia is a place of the greatest trade in India, the customs must be very considerable; more especially as the inhabitants are in general wealthy, and almost every article is subject to a duty.

The taxes are paid monthly; and to save the charge and trouble of gathering them, on the day they become due a flag is displayed on the top of a house in the center of the town, and all parties are obliged immediately to pay their money to the proper officers appointed to receive the same.

The money current here consists of several sorts; as ducats, which are valued at 132 fivers; ducatoons, at 80 fivers; imperial rix-dollars, at 60; rupes of Batavia, at 50; schellings, at six; double cheys at two fivers and an half; and doits, at one fourth of a fiver. Some of these coins are of two sorts, though of the same denomination, namely, milled and unmilled, the former of which is of most value: a milled ducatoon is worth 80 fivers, but an unmilled one is not worth more than 72. All accounts are kept in rix-dollars and fivers, which are here mere nominal coins, like our pounds sterling.

Besides their land forces, the Dutch have a number of men of war sufficient to engage any fleets they are likely to meet with on the Indian seas. And from their great importance in this part of the globe they assume the title of "Sovereigns of all the seas, from the Cape of Good Hope eastward, to Cape Horn in America."

Having thus noticed every necessary particular relative to the city of Batavia, we shall now describe such other remarkable places in this island as merit attention.

About 80 miles east of Batavia is Cherobon, a place of considerable extent, and where the Dutch have a factory. The country is very fertile, and produces most kinds of provisions, particularly rice. The inhabitants are under the dominion of four great lords, called *sultans*, one of whom is particularly attached to the Dutch, and for that reason is distinguished from the rest by the name of the company's sultan. The rest, indeed may not be undeserving of the like epithet, as they are in alliance with the Dutch, whose friendship they endeavour to preserve, and whom they consider as their sole protectors; for had it not been for them these petty princes would have been reduced to the subjection of the king of Bantam, who made depredations on their district, but was subverted by the interposition of the Dutch. Since this circumstance, the sultans have testified their gratitude by granting many distinguished privileges to their protectors in these dominions. The chief person belonging to the Dutch factory here is called the resident, who corresponds with the governor-general

ral of Batavia, but is solely independent of any other officer. Here is a good fort, where the Dutch have a garrison consisting of 80 men; about a mile and a half from which is a large temple containing the tombs of several of the princes of Cherebon. It is a lofty building made of variegated stones, and very elegantly ornamented within. The generality of their priests reside near this temple, the whole order of whom are treated with the most distinguished respect by the inhabitants. It is said the English had once a factory here, but that having made too free with the wives of the natives, they murdered them all, and levelled their buildings to the ground.

Palamboan, the capital of a kingdom or principality of the same name, is situated in 114 deg. east long. and in 7 deg. 30 min. south lat. on the freights of Bally, through which the East-India ships sometimes pass when they are homeward bound from Borneo: in which case they generally touch at this place to take in water and fresh provisions. This kingdom, which is independent of the Dutch, lies at the south-east end of Java, in a pleasant country watered with several rivulets, which fall on each side of the town into the neighbouring freights. The rajah, or king of this country, generally resides either at Palamboan, or at a fort 15 miles from the sea. His dominion reaches from the east end of Java 80 miles along the south-coast, and about 60 miles from north to south; but its extent up the country is not known. This kingdom is said to produce gold, pepper and cotton; also rice, Indian corn, roots and garden stuff. Their animals are, horses, buffaloes, oxen, deer, and goats; and they have great plenty of ducks, geese, and other sorts of poultry. The sovereign and his subjects are Pagans, but there are some Mahometans among them, and a few Chinese.

Mataram, at the time it was an empire, extended over the whole island, and even now takes up a considerable part of it, is under the government of the Dutch, and was the last reduced to subjection by them on this island. Mataram continued its struggles for independency till the year 1704, when the Dutch took the advantage of an opportunity that offered in a dispute relative to the succession of the crown, between the son and brother of the deceased sovereign. These two rivals produced an universal division in the nation. He who was entitled to the crown by order of succession had so much the advantage over his antagonist, that had it not been for the Dutch, who declared in favour of his rival, he would certainly have got the supreme power into his own hands. After a series of contests, the party espoused by the Dutch at length prevailed: the young prince was deprived of his succession, and his uncle, who was unworthy of the character, usurped the throne.

After the death of this sovereign, the company placed the legal heir on the throne, and dictated such laws to him as they thought best calculated to answer their sinister purposes. They chose the place where his court was to be fixed, and secured his attachment by erecting a castle, in which a guard was kept with no other apparent view than to protect the prince. They employed every artifice to lull his attention by pleasures, made him valuable presents, and flattered him by pompous embassies. From this time the prince and his successors have become mere tools of the company. The necessary protection allowed them by the Dutch consists of 300 horse and 400 foot: but the expences the company are at on this account are amply repaid by the advantages arising from the country. The harbours afford docks for build-

ing all the small vessels employed in the service; and they are supplied from hence with the chief part of the timber that is used in their respective settlements. Besides these advantages, they are furnished with various productions of the country at certain stipulated prices, which are so low as to produce very pecuniary emoluments.

The kingdom of Mataram is in general very fertile, and produces great quantities of rice; as also plenty of fruit. There are likewise various sorts of animals, particularly horses, sheep, goats, and remarkable large oxen. The rivers abound with fish, and the woods produce great plenty of game. But the most valuable articles of this country are, rice, pepper, cadjang, cotton, yarn, cardamon and indigo; the latter of which is esteemed to be as good in quality as any found in the Indies.

The king usually resides at Mataram, the capital of the kingdom. His palace is a very handsome spacious building, adjoining to which are many good houses belonging to his nobles, who every day wait on him; and his subjects in general pay him the greatest homage.—It is here to be observed, that though these princes are vassals, yet they are permitted to live in as great state as when they were really monarchs; and the orders of the Dutch are always executed in their names. They therefore assume a dignity not inferior to the most despotic prince, and when they go abroad, are attended with every distinguished mark of royalty.

The last place of importance we have to mention in this island is Japara, situated at the bottom of an eminence called the Invincible Mountain, on the top of which is a fort built of wood. It is a very considerable town, and has a good road secured by two small islands. The English had once a factory here, but they were driven from it by the Portuguese, who at that time were masters of the place. This country produces almost every necessary of life, especially cattle, hogs and poultry: they have also great plenty of rice, with various sorts of the most delicious fruits; and their waters abound with the best of fish. But the most valuable commodities here are pepper, ginger, cinnamon and indigo. In the woods and mountains are several kinds of wild beasts, as buffaloes, tigers, and rhinoceroses; the latter of these the natives hunt for the sake of their horns, which they convert into utensils that are much admired, by reason that they will not contain poison; for if any composition of that quality is put into them, they will immediately break to pieces.

The natives of this country are much like those in other Indian nations; and they have the same kind of customs and ceremonies. They are very fond of public diversions, particularly the representation of comedies, which principally consists in singing and dancing; and they are such slaves to cock-fighting, that by the large sums they lay, they are often reduced to the most abject distress.

The inhabitants of Japara are chiefly Mahometans, as is also the king, who generally resides at a place called Kattasura, where the Dutch have a fort and garrison. This prince reigns absolute among his subjects, who are very faithful, and pay him the greatest homage. Like most eastern monarchs, he is constantly attended by women, and takes as many wives and concubines as he thinks proper. When his courtiers obtain an audience, they approach him with the greatest humility; and even his priests to reverence him, that some of them go in pilgrimage to Mecca, to make vows for the prosperity of him and his family.

in the service; and the chief part of the settlements. Beset with various stipulated prices, pecuniary enolu-

C H A P. XXVII.

9. Of the Islands adjoining to Java, particularly the Island of TIMOR.

THERE are several islands bordering on the coast of Java, which are conveniently situated for accommodating such European vessels as pass to their government.

Opposite the easternmost point of Java is the island of Madura, the most valuable produce of which, for foreign markets, are deer skins. Its principal town is Arabia, situated near a deep bay about eight leagues from the westernmost land of Java. The soil of this island is very fertile, and produces several sorts of grain, particularly rice; also various kinds of the most delicious fruits. The chief animals are, buffaloes, horses, sheep and oxen, the latter of which are remarkably large, and the flesh little inferior to those of Europe. The buildings of the inhabitants, and their maxims and customs, are much the same as in other Indian nations; but they are divided in their religion, some of them being Mahometans, and others Pagans. The men are in general very robust and courageous, for which reason they are called upon by the Dutch, when occasion requires, to recruit their forces at Batavia, or such others of their settlements, where there is any deficiency in the fixed number of their troops.

The island of Bally, by some called Lesser Java, is situated to the east of Java, from which it is divided on the west by the straits of Bally. It is a small island, but produces a great plenty of all kinds of provisions; and the natives, like those of Madura, are very strong and bold. The straits are narrow and dangerous, and it is with great difficulty a passage can be made from Madura to this island, owing to the violence of the winds that blow from the south once in 24 hours.

To the east of Bally is the island of Lambock, which is also very small, but produces every necessary article for the enjoyment of the inhabitants, though not any particular one for foreign markets.

Near Lambock are the straits of Allafs, so called from a town of that name on the shore, opposite to which lies the island of Combava. This is a much larger island than either of the former two, notwithstanding which, it does not produce any particular article for exportation.

To the east of Combava are two small islands called Sippi; but they are not of any account in commerce. Adjoining to these is the island of Flores, which is tolerably large, being 150 miles in length, and upwards of 50 in breadth. At the west end of this island is a town called Larrentoueka, the inhabitants of which are distinguished for the infamous practice of poisoning strangers.

At a small distance from Flores, is the island of Solor, where the Dutch have a factory; and to the east of this lie the islands of Leolana, Panterra, and Misomby, all of which are only remarkable for producing a small quantity of sandal wood, and some cassia-lignea.

Amidst this cluster of islands, the most considerable is Timor, which lies about 50 miles from the three last-mentioned. It extends almost north-east and south-west, and is situated betwixt 124 and 128 degrees of east longitude from London; and the middle of it is in nine degrees of south latitude. It is upwards of 200 miles in length, and more than 50 in breadth; and is divided into several principalities or kingdoms. It has not any navigable rivers or harbours, but there are several bays where ships may ride at some seasons of the

year with the greatest safety, as the shore is good, and free either from rocks or shoals. The Dutch and Portuguese have both factories on this island; but the latter is the most considerable.

The principal kingdoms in this island are Namquimal, Lortribby, Pobumby, and Amaby; each of which has a sovereign who governs his own territories independent of the rest. These kings are absolute monarchs, and preserve a dignity not inferior to other princes of the east. They have several rajahs, and other distinguished officers under them; all of whom, with their subjects in general, pay them the greatest homage. Each kingdom has a language peculiar to itself; but the manners and customs of the inhabitants are much the same.

The island of Timor is very fertile, and produces a variety of valuable articles, particularly cocoa-nuts, which grow here in great abundance. There are also several sorts of trees that make excellent timber for ship-building; and in some parts of the island are sandal wood and cotton trees. They have likewise many kinds of fruit, as pine-apples, mangos, jakas, plantains, pomegranates, oranges, lemons, limes, and wild tamarinds.

The tame animals here are oxen, horses, goats and sheep; and the wild ones, buffaloes, wild boars, and different kinds of monkeys. There are also great numbers of lizards, scorpions, and serpents of various sorts, some of which are exceeding large, and much dreaded by the natives.

They have different sorts of poultry, among which are ducks and geese; but these were first brought thither by the Europeans, and the climate being too hot, they do not thrive; and are therefore very indifferent food. In the woods are great numbers of wild fowl and other birds, some of which are greatly admired for the beauties of their plumage. One of these is called the ringing-bird, from its musical notes, which imitate the ringing of bells: it is a small bird, and is beautifully variegated, the wings being blue, the head of a reddish cast, and the breast a shining crimson.

The seas and rivers produce great plenty of fish, particularly the former; among which are mackerel, turtle, prawns, craw-fish, several sorts of oysters, and cockles of a most extraordinary size.

The natives of this island are of a low stature, and very swarthy in complexion; but they are frail, and their limbs rather delicately constructed. Their dress consists only of a small piece of cloth tied round the waist, and on their heads they wear a cap or bonnet made of palmetto leaves: the better sort decorate their heads with a kind of coronet made of thin plates of silver or gold, scalloped or indented on the edges; and the inside of it is curiously ornamented with feathers of various colours.

Their usual employment is hunting and fishing, in the former of which they are very expert. Their weapons are swords, darts and lances, and with these they go into the woods in pursuit of buffaloes, which they run down, and then kill them with their darts.

Land here is of little value, for the natives in general are too indolent to be at the trouble of cultivating it; but those who do are rewarded by the land becoming their own property.

They know little of arts or sciences, and are very poor mechanics, their principal ingenuity consisting only in building, the implements and materials for which they receive from the Chinese, who also bring them rice, tea,

tea, iron, porcelain, and raw and wrought silk; in exchange for which they take bees-wax and sandal wood.

The most general languages used by the inhabitants of this island are the Malayan, and a corruption of the Portuguese; but the natives have a language of their own. It is said, those who are independent of the Dutch and Portuguese, have a peculiar enmity to European strangers; and that when any land on the coast, if they have an opportunity, they will not hesitate to murder them.

The fort belonging to the Dutch here is called Concordia, situated on a rock near the sea, between two and three miles from the south-east point of the island. It is a plain building, and poorly fortified; but the natives are so well affected to them, that they are not under any apprehension of danger. There are fine gardens belonging to the fort, which are inclosed by a stone wall; these gardens produce plenty of several kinds of vegetables, as also a great variety of the most delicious fruits; and opposite to the entrance of the fort is a fresh water river that abounds with variety of fish.

The Portuguese settlement on this island is called La-

phao, and is situated by the sea side about three leagues to the east of the Dutch fort. It is a very small place, containing only a few mean houses, and a church made of boards, covered with palmetto leaves. There is, indeed, a kind of platform here, on which are six iron guns; but the whole are so much decayed as to be rendered almost useless. The people in general speak the Portuguese language, and the natives have been so intermixed with the Portuguese by marriages, that it is difficult to know one from the other. They are very fond of being called Portuguese, and most of them profess the Roman Catholic religion; but in the other parts of the island they are either Mahometans or Pagans. Some trade is carried on at this place by the Chinese, who come here annually with their junks, and take the commodities of this country in exchange for those of their own. But the place where the greatest trade is carried on is Porto Nova, situated at the east end of the island, and where the Portuguese governor usually resides. This town, with that of Concordia belonging to the Dutch, were some years ago attacked by a pirate, who plundered, and then destroyed several of the buildings.

CHAP. XXVIII.

10. The Island of SUMATRA.

SUMATRA, the most considerable of the Sunda islands, is situated in the Indian ocean, between 93 and 104 degrees east longitude, and five deg. 30 min. north latitude. It is bounded on the east by Borneo, on the north by Malacca, on the south-east by Java, and on the west by the Indian ocean. It is long and narrow, reaching in a direct line from the north-west to the south-east, and is about 800 miles in length, and 100 in breadth. It is the first of the remarkable islands that form the great Archipelago of the east, the entrance of which is, as it were, blocked up by this island and Java, which form a barrier separating the Indian from the Chinese ocean; with this exception, that in the center between the two islands there is an opening, which appears as if purposely designed to admit a free passage for the advantages of commerce. This opening is called the strait of Sunda, the south part of which is the north of Java, and called Java Head; and the north point is the south of Sumatra, called Flat Point. These two are about six leagues asunder, between which ships pass from Europe directly to Batavia or China, without touching in the Indies: they stretch away east from the Cape of Good Hope, and make no land till, having traversed the whole Indian Sea, they arrive at Java Head.

The air of this island is in general very unwholesome, arising chiefly from the two extremes of heat and cold, and the intermixture of wet from very heavy rains. The day and night are equal, and the inconvenience that occur from the excessive heat of the former, is greatly increased by the cold chilling winds of the latter.

A chain of mountains runs through the whole island from the north-east to the north-west, and here the air is more wholesome than on the coast. There are also capital mountains on the west coast, in one of which a volcano that frequently throws out flames of fire.

The winds, or periodical winds, shift here at the same time they do in other parts of the Indian seas, blowing six months in one direction, and six months in the opposite direction; and near the coast there are other periodical winds, which blow the greatest part of the day from the sea, and in the night and part of the morn-

ing from the land; but these scarce extend seven miles from the coast.

There are many small rivers on this island, but not any of them navigable, and their waters are very unwholesome. The river Indrapura, which falls into the sea on the west coast, has a water tinged with red, occasioned, as it is said, by the great quantity of oaker that grows on its banks, which are always covered at the time of the floods. The waters of all the rivers that overflow the low countries, are very foul, and not fit for use till they have been boiled, and infused with tea, or some other wholesome herb.

The most valuable produce of this island is pepper, rice, sugar, camphire, gold-dust, bezoar, canes and cotton. The soil is in some parts very fertile, and well watered with rivulets; but in the low-lands next the sea are abundance of bogs and marshes, which produce only reeds and canes of bamboo.

Here are plenty of most kinds of fruits, which arrive to the greatest perfection, and are equal to any found in the Indies; as cocoa-nuts, limes, oranges, mangoes, plantains, guavas, jakas, durians, pine-apples, mangoes, and other tropical fruits: they have also melons, peas, beans, potatoes, yams, radishes, pot-herbs, fallads, and plenty of all kinds of garden-stuff. There is likewise a plant grows here called bang, which is somewhat like hemp, and when infused in liquor, operates much like opium; this is sometimes used by the natives, particularly when they are engaged in war, and animates them to persevere in the most dangerous undertakings.

The animals here are, horses, buffaloes, deer, goats, hogs, oxen, and hog-deer, from the latter of which is obtained a species or kind of the bezoar stone. This stone is of a dark brown colour, and has two coats, the innermost of which is covered with small fringes, but the outer coat is quite smooth. When the stone is dissolved in any liquor, its taste is exceeding bitter; but if a small quantity of it is taken by some who have an oppression of the stomach, a foul flatulency, or a want of appetite, it will remove the complaint, and is also very efficacious in other disorders incident to human nature.

In the woods and mountains are several sorts of wild animals,

side about three leagues is a very small place, and a church made of leaves. There is, in which are six iron decayed as to be rendered in general speak the lives have been so many marriages, that it is other. buffaloes, deer, and the latter of which of the best of the colour, and has two is covered with small smooth. When the its title is exceeding it is taken by the much, a food that, now the complaints, is considered incident to

several sorts of wild animals,

animals, as tigers, elephants, rhinoceroses, monkeys, and wild boars: there are also squirrels, guanos, porcupines, alligators, serpents, scorpions, muquitos, and other venomous insects; and this is said to be the only island in the East-Indies where there are bears.

They have several sorts of poultry, particularly fowls and ducks; also pigeons, doves, parrots, parakeets, macaws, and a great variety of small birds.

The rivers abound with fish, among which are, mullets, craw-fish, shrimps, eels, oysters, &c. and they have plenty of turtles: but some of the rivers are greatly peppered with crocodiles.

The north part of the island produces great quantities of gold, which are got out of the rivers and mountains; and the trade of Achen principally depends on this valuable commodity. There are also mines of tin, iron, brass, copper, &c. It has not any wheat or rice, but great quantities of barley, honey, wax, sugar, ginger, and pepper, with which they load their vessels every year, and they send their pepper and gold in exchange for rice and opium, which our merchants send them from Bengal and other parts.

The inhabitants of this island are of two sorts: those that inhabit the coast are Mahometans; and the mountaineers, or natives, are Pagans. They are in general of a moderate stature, and a very swarthy complexion: they have black eyes, flat faces, and high cheek bones; their hair is long and black, and they take great pains to dye their teeth of the same colour: they likewise besmear themselves with oil, as in other hot countries, to prevent being stung by the insects, and let their nails grow exceeding long, scraping them till they are transparent, and dying them with vermilion.

The poorer sort go almost naked, having only a small piece of cloth fastened round the waist; and about their heads they wear a piece of linen, or a cap made of leaves, resembling the crown of a hat; but they have neither shoes or stockings. The better sort wear drawers or breeches, and a piece of calico or silk wrapped about their loins, and thrown over the left shoulder; and when in towns they wear sandals on their feet.

In their dispositions they are very proud and revengeful; and so indolent, that they will neither endeavour to improve themselves in arts and sciences, or in husbandry; but suffer their manufactures to be neglected, and their lands to lie without cultivation. If foreigners, therefore, were not to supply their defects, they would most likely suffer themselves to be reduced to a savage state, and only preserve their existence, like the beasts of the country, by such articles as is furnished without the assistance of industry. Their chief food is rice, with which they sometimes use a strong soup made of flesh or fish, or a small quantity of meat highly seasoned with spices. The Mahometans, as in other countries where the same religion is professed, are very abstemious in the use of meats, particularly swine's flesh; neither will they touch strong liquors: but the natives eat all kinds of flesh, except beef, the ox being the principal object of their worship. Their common drink is tea, or plain water; but they sometimes use the liquor of young cocoa-nuts, which is very cooling and pleasant. Their salutations are much the same as in other Asiatic countries, and they always sit cross-legged on the floor at their meals.

The Mahometans speak and write the Malayan language, but the natives have a language peculiar to themselves. These last write as we do, from the left hand to the right; and, instead of pen, ink and paper, they write, or rather engrave, with an instrument made of iron on the outside of a bamboo cane. The Malays write from the right hand to the left; but they use ink, and write with pens on a sort of brownish paper. They are very indifferent accountants, but in this defect they are assisted by the banians, who reside amongst them, and are chiefly employed as clerks to settle their accounts, being considered in this particular to have abilities little inferior to those of Europe.

Their only vessels here are flying prizes, which are greatly admired for the neat and convenient manner which they are constructed. They are very expert in building their houses, but in all other mechanical art-

they are very deficient. The Chinese are the chief mechanics on the island, and great numbers of them have settled here, particularly at Achen. Several sail of Chinese junks arrive here annually, bringing with them rice and other produce of the country; as also artificers of various trades, who, during their stay, employ themselves in making cabinet goods, household furniture, and toys, which they expose to sale in a street called the Chinese Camp, situated on an eminence near the sea. When they have sold their goods, they return home; but as they are naturally addicted to gaming, they seldom leave the country till they have lost all their property; and some will carry it to such lengths, as even to dispose of their own vessel, lose the money, and then work their passage home in another.

The island of Sumatra is divided into several kingdoms and principalities; but the most considerable is Achen, which comprehends the whole northern part of the island.

Exclusive of the king of Achen, who is the greatest monarch in the island, there are several oranayats, or great lords, in this kingdom, who exercise sovereign authority in their respective territories; but they all acknowledge the king of Achen their superior, and accept of the great offices in his court. In former times the kings have exercised such despotic power as to displace some of these, and displace others; and, on the contrary, instances have been known where these princes have deposed the kings, and placed another on the throne. There have been repeated struggles between the king of Achen and these princes for sovereign power; and if the former has in some reigns been absolute, he has in others had a very limited authority. The king has the power of disposing of the crown during his life to such of his children as he thinks proper, whether born of a wife or a concubine; but if the king does not dispose of it in his life-time, there are sometimes several competitors for it; and he who is most favoured by the oranayats, or vassal princes, usually carries his point, and in these cases the crown is elective.

Achen, the capital city of this kingdom, is situated in 3 deg. 30 min. east longitude, and five deg. 30 min. north latitude. It stands in a plain about five miles from the sea, 1000 miles south-east of Fort St. George in India, and 450 miles north-west of the city of Malacca. The harbour, which is so large as to be capable of containing any number of the largest ships, is commanded by a spacious fortress encompassed with a ditch well fortified according to the Indian manner, and mounted with cannon. There are seven gates belonging to the city, besides which there are other redoubts and fortifications in the adjacent marshes.

The city contains about 8000 houses, which are built on posts two feet above the ground, on account of the great rains that sometimes overflow the city, that the inhabitants go from one house to another in boats. The floors and sides are made of split bamboo, and they are covered with reeds, cocoa or palmetto leaves. They are chiefly divided by palisades, except in two or three particular streets set apart for trade, and one that is particularly inhabited by the Chinese. The Europeans live as near each other as they can, in a long street near the river. They consist of English, Dutch, Danes, and Portuguese, who, with the Gazizats and Chinese, are the chief traders in the city.

The king's palace is situated in the center of the city, and is an ordinary building of an oval form; but it is very spacious, being at least a mile and an half in circumference. There are several courts that lead to the royal apartments, each of which is defended by a strong gate guarded by soldiers. The palace is encompassed by a large moat, on the sides of which grow reeds and canes of such immense height as to conceal the whole building. The gates are surrounded by a strong wall, on the top of which, in different parts, are planted small guns; and through the palace runs a reservoir for the convenience of bathing, the bottom of which is paved with marble.

The king's elephants and magazines are kept in the inner courts of the palace; and at proper distances are several small forts well guarded and stored with artillery.

and fire-arms. But the king's greatest strength consists in his elephants, which are very numerous, and so trained, that they will stand unmoved at the firing of artillery: it is said, that when they pass the king's apartments, they will salute him by bending their necks, and raising their trunks.

The king has also a great number of horses, all of which, as well as the elephants, have rich and magnificent trappings.

He is not at any expence in times of war, for at his command all his subjects are obliged to march at their own expence, and carry with them provisions for three months: if they are in the field longer than that time, he supplies them with rice for their support. On their going out he furnishes them with arms, a register of which is kept, and they are obliged to restore them at their return.

The king of Achen must certainly be very rich, for he is at much less expence than any other prince in the Indies. In war he is only at the expence of arms, powder, lead, and rice, which is very trifling; and in peace it does not cost him any thing, even for the maintenance of his family. He has more flesh, fowl, and all kinds of provisions paid him by his subjects, than are consumed in the palace, and the surplus is sold at the market for his benefit. He divides hereditary estates among his subjects, whom he obliges to furnish him with a certain quantity of rice every year. This he puts into his magazines, and exports to such places where there is a scarcity of that article.

He is not at any expence either for his own cloaths, or those of his concubines; for on a certain day in the year, all who have any office or place in the city, are obliged to make him a present of one or more garments, according to the income of their places. If the king disapproves of what is presented, he returns it back, and the officer that gave it is sure to be turned out of his place, unless he adjusts the matter by complimenting him with a sum of money.

He is heir to all his subjects who die without male issue, and if they have any daughters unmarried, he sends them to the palace. He is also heir to all foreigners that die within his territories; for when such a person is known to be ill, the king's officers take possession of his house, and on his death remove his effects to the castle. He has the estates of all those put to death; and almost every day produces an instance of some innocent man's suffering purely to gratify his unbounded avarice. If it is a wealthy person in office that is pitched on, he is accused of mal-administration; and, to prevent their alienating their estates or goods, he takes them by surprise, and has their wives, children, slaves, cattle, and all their moveables lodged in the castle, before they know their sentence. Is this the tyranny of this despotic prince!

The inhabitants of Achen are more vicious than in other places on the coast: they are proud, envious, and treacherous; despite their neighbours, and yet pretend to have more humanity than the inhabitants of any other nation. Some of them are good mechanics, especially in the building of galleys; and they are very dextrous in doing all kinds of smith's work: they also work well in wood and copper, and some of them are skilled in making artillery. They live very abstemiously, their chief food being rice, to which some of the better sort add a small quantity of fish; and their usual drink is water. They are very fond of tobacco, though they have but little of their own raising; and, for want of pipes, they smoke in a buncos, in the same manner as the inhabitants on the coast of Coromandel. The buncos is the leaf of a tree rolled up with a little tobacco in it, which they light at one end, and draw the smoke through the other till it is nearly burnt to the lips. These rolls are very curiously formed, and great quantities of them are sold in the public markets.

They are all Mahometans, and, agreeable to the laws of the Koran, are permitted to marry as many women as they please, but the first is entitled to the preference, and the children by her are esteemed the lawful heirs. If any disputes arise between the husband and his wives, they may separate, provided they mutually request it.

but the solicitation of one only will not be sufficient.

A court of justice is held five times a week for determining all matters of controversy, in which one of the chief orankayas presides as judge. There is also a criminal court, where cognizance is taken of all quarrels, robberies, murders, &c. committed in the city: and there is a third court, in which the cadi, or chief priest, presides, who takes cognizance of all infringements of an ecclesiastical nature. Besides these, there is a court for determining disputes between merchants, whether foreigners or natives. Here an exact account is kept of all the customs, gifts, fines, and commodities belonging to the king, with a list of all the persons who buy of his majesty, pay the duty, or make him presents.

Robberies and murders are more frequent here than in any other part of the Indies, notwithstanding the laws are of the most severe nature. All offenders are brought to a speedy trial, and the punishment is inflicted immediately after their conviction. If the offence be of a trifling nature, the punishment for the first time is the loss of a hand or foot, and the same for the second; but for the third, or if they rob to a considerable amount, they are impaled alive. When the hand or foot is to be cut off, the limb is laid on the edge of a broad hatchet, and the executioner strikes it with a large mallet till the amputation is perfected; and then they put the stump into a hollow bamboo stuffed with rags or moss, to prevent the criminal from dying by the loss of blood. After he has thus suffered, whether by the king's command, or the sentence of the judge, all the ignominy of his crime is wiped off; and if any one upbraids him with it, he may kill him with impunity. Murder and adultery are punished with death; and, in this case, the criminal has many executioners, he being placed amidst a number of people, who stab him with their daggers; but female offenders are put to death by strangling. The king is frequently a spectator of these punishments, and sometimes acts himself as executioner: and though such a spectacle must, to a feeling mind, appear of the most horrid nature, yet so little does he seem to be affected by it, that instances have been known of his executing a criminal, and immediately going to entertain himself with cock-fighting, a diversion more universally esteemed than any other in the country.

Having thus noticed every material particular relative to the kingdom and city of Achen, we shall now point out the other places that are distinguished in this island, beginning with those on the western coast. The first of these is Bencoolen, a settlement belonging to the English, but chiefly inhabited by people of other nations. This town is situated in 103 deg. east longitude, and three deg. 10 min. south latitude. The adjacent country is mountainous and woody, and in some parts are volcanos that frequently issue out fire. The air is very unwholesome, and the mountains are generally covered with thick clouds that burst in storms of thunder, rain, &c. The soil is a fertile clay, and the chief produce is grass; but near the sea it is all a morass. The natives build their houses on bamboo poles as at Achen, but the English build theirs with timber, not only from their being in want of stone, but on account of earthquakes, which very frequently happen in this part of the island.

On the north-west side of the town is a small river, by which the pepper is brought here from the inland part of the country; but there is a great inconvenience in shipping it, on account of a dangerous bar at the mouth of the river. The road is also dangerous for ships, as it has no other defence from the violence of the sea during the south-west monsoons, than a small place called Rat Island, which, with the land point of Silabar, makes the haven. The town is about two miles in circumference, and is known at sea by a very high slender mountain, called the Sugar-Loaf, which rises in the country 20 miles beyond the town.

The pepper brought here comes from the territories of two neighbouring rajahs, one of whom resides at Singlediamond, at the bottom of a bay 10 or 12 miles to the north; and the other at Bufar, 10 miles to the east.

These two rajahs have houses in the town, whither they come when they have any business to transact with the English, who pay them half a dollar duty for every 500lb. weight of pepper; and they also pay to the owner for every such quantity 10 Spanish dollars, weighing each 17 pennyweights and 12 grains.

The English first settled on this island about the year 1685; a few years after which the East-India company built a fort, and called it Fort York. In 1693, a contagious distemper raged with such violence, that the governor and council all died in a very short space of time, which was attributed to the town being situated on so unwholesome a spot as not to be borne by an European constitution. In consequence of this calamity, the English, in 1719, began to build a new fort in a more healthy part, and better adapted for regular fortifications; but they had no sooner raised the walls of it, than the natives, who had a long time been at enmity with them, attacked the place, and set fire to the principal part of their buildings; on which the governor, with his small garrison, precipitately embarked for Batavia, leaving behind them several chests of money, and all the artillery, arms, ammunition, &c. The natives however, finding themselves greatly injured by the absence of the English, and not having any method of disposing of their pepper, in a short time after invited them to return, and again take possession of their new settlement. This invitation being accepted, the fort they had begun was soon completed, under the name of Marlborough Fort; and they have been in quiet possession of the place from that time to the present.

The English have another settlement at Silibar, which is situated about 15 miles from Bencoolen; and here they constantly keep a detachment from Marlborough Fort. The town is tolerably large, and before it is a convenient harbour; but it hath not any building or other matter that demands particular attention.

They have also other settlements to the north-west of the above; particularly at Catuan, situated about 40 miles from Bencoolen, Ippo, about 30 miles farther to the north; Bantall, which is upwards of 100 miles north of Bencoolen; and Mocho, situated a little to the south of Indrapour.

The Dutch have likewise several good settlements on this island, the most considerable of which is Pullambang, or Pullambam, situated about 120 miles north-east of Bencoolen. The chief article of trade here is pepper, of which the Dutch have prodigious quantities, being under contract with the king of Pullambam, and other inland princes, to take it at a certain price, which they pay one half in money, and the other in cloth. All other nations are prohibited from trading here, except the Chinese, by means of whom the English get a share of their pepper, as our ships pass through the straits of Banca. The Dutch formerly carried on a great trade here in opium, but as that was found to impoverish the country, by drawing away its ready cash, the king, in 1708, ordered only three chests, of about 160lb. each, to be imported; and that if any should be detected in acting contrary to this order, they should not only forfeit their goods, but also their lives.

The town of Pullambam is very large, and pleasantly situated on the banks of a fine river, which divides itself into several branches that run by four channels into the sea. It was formerly a considerable city, in which state it continued till 1659, when it was destroyed by the Dutch, in revenge for some injuries they pretended to have received from the natives. It was about this time that the Dutch reduced the chief of the kingdoms in the south part of this island; but several of them were afterwards recovered by the natives, who have ever since continued to enjoy their original liberty.

The other Dutch factories here are,

Bancalis, situated nearly opposite to Malacca, on the banks of a spacious river of its own name. The chief articles sold by the company here are cloth and opium; in return for which they receive gold dust. The country is very fertile, and in the woods and mountains are prodigious numbers of wild hogs, whose flesh is exceeding sweet and fat. They have likewise some good poultry, and the river abounds with various kinds of fish.

Siack is situated on the river Andraghina, but is a very inconsiderable place, on account of the unwholesomeness of the air, which is attributed to the great number of shads caught in the river at a particular season of the year, for the sake of the roes; and the rest of the fish being thrown in heaps, corrupt and exhale pestiferous vapours. These roes the natives pickle, and then dry in smoke; after which they put them in large leaves of trees, and send them to different countries between Achem and Siam. It is called Turbow, and is reckoned to be great a delicacy, that few of the better sort are without it.

Padang is situated about 60 miles south of the equator, and has a fine river, where large ships may come up, and ride in safety; but it is the most insignificant settlement the Dutch have on this island: it produces but a small quantity of pepper, and the trade in gold is trifling, as hardly to defray the natural expences attending it. There are many other places on this island independent of the English and Dutch; the principal of which are,

Priaman, situated nearly opposite to Padang, about 100 miles north-west of Indrapour. It is very populous, and plentifully supplied with most kinds of provisions. The natives carry on a considerable trade in gold with the inhabitants of Manimabo. The Dutch had a factory here for some years, but were at length driven from it by the king of Achen.

Ticow is a very considerable place, situated about seven leagues from Daulaman, in 20 deg. south latitude. The inland part of the country is very high; but that next the sea is low, covered with woods, and watered with several small rivers, which render it marshy. There are, however, many pleasant meadows well stocked with buffaloes and oxen, which are purchased at a very easy price. It likewise affords plenty of rice, poultry, and several sorts of fruits, as durians, ananas, oranges, citrons, pomegranates, melons, mangoes, cucumbers and potatoes. But its most valuable produce is pepper, with which it abounds, and is in quality esteemed superior to that of any other place on the island. The pepper chiefly grows at the bottom of the mountains; for which reason those parts are exceeding populous. The city is situated about two miles from the sea, opposite to a small island. It is but a little mean place, for the city and suburbs do not contain 800 houses, which are chiefly built with reeds, and are neither strong or convenient. The king is subject to the king of Achen, who appoints a new governor every three years, and without him the king of Ticow cannot execute any business of importance. The governor, therefore, is the person applied to by foreigners in the transacting of business, and even the natives pay him the most distinguished respect. The inhabitants of the city are Malayans, but the inland parts are possessed by the natives, who disown the king of Achen's authority, and have a peculiar language and king of their own. This part of the country produces great quantities of gold, which the natives exchange with the Dutch, or the inhabitants near the coast, for pepper, salt, iron, cotton, red cloth, and Surat pearls. The air here is very unhealthy, particularly from July to October, and the people are very subject to fevers, which are so violent in their nature, as seldom to admit of being removed; so that was it not for the pepper, no stranger would venture to go near them. Every person who trades at this place must have a licence for that purpose from the king of Achen; and when that is obtained, they cannot be interrupted either by the king or governor of Ticow. They sell their pepper by bahars, a weight containing 116lb. avoirdupois, and the king of Achen has 15 per cent. out of all that is sold, that is, 7½ for the export of the pepper, and 7½ for the import of the commodities given in exchange for it.

Barros, one of the most considerable places on the west coast belonging to the king of Achen, is situated on a fine river near about the center between Ticow and Achen; and, like the former, no person must trade here without permission from the king. This place produces great plenty of gold, camphire, and benjamin, the latter of which serves the natives instead of money.

3 L The

The country is very pleasant, and abounds with rice, and several sorts of the most delicious fruits. The Dutch and English, as also the inhabitants of the coast, buy up the camphire here, in order to carry it to Surat, and the streights of Sunda.

Andrigri is a small province, but remarkable for producing great quantities of pepper; and gold is cheaper here than in any other part of the island.

Jamby also produces great quantities of pepper, which is said to be much superior in quality to that of Andrigri. The Dutch had once a factory here, the most considerable of all their settlements on the coast, but they withdrew from it in the year 1710. The English had likewise a factory near it, but they also withdrew on account of the obstructions they met with in trade from the Dutch.

Pedir is a large territory situated about 30 miles from Achen, and has the advantage of an excellent river. The soil is very fertile, and the country produces such quantities of rice, that it is called the granary of Achen. It also produces a large quantity of silk, part of which is wove by the natives into stuffs, that are valued in most parts throughout the island, and the rest is sold to the inhabitants of the coast of Coromandel.

Passaman is a large place situated at the foot of a very high mountain, but is remarkable only for producing pepper, which is not only very large, but excellent in its quality.

Daya abounds in rice and cattle; and Cinquele produces annually a large quantity of camphire, which the inhabitants of Surat, on the coast of Coromandel, purchase for 15 or 16 rials the cotti, or 28 ounces.

There are several islands belonging to that of Sumatra, among which is one called by the inhabitants Pulo Lanchakay, and by the natives of Achen, Pulo Lada, or the island of Pepper. This is a large island, situated in 6 deg. 15 min. north latitude. In the center of it are two high mountains separated from each other by a very narrow valley; and at the foot of these mountains is a plain that extends at least 12 miles in

length. In this plain the pepper is produced; but the island is very thinly inhabited. The soil of the plain is well calculated for all kinds of drugs, fruit, rice, and cattle; and, as it has several good springs and rivers, it might produce excellent pasture; but the inhabitants only attend to the cultivation of pepper, as that is the article which turns out most to their advantage. The other parts of the island are covered with thick woods, in which are some trees that are remarkably fruit and lofty. The winds are westerly from the beginning of July to the end of October, during which time they have very heavy rains; and the climate, as in other parts of the same latitude, is very unwholesome. The island at present produces 500,000 lb. weight of pepper annually, which is said to be preferable to that of any other place in the Indies. The inhabitants are Malaysians; but are naturally better disposed than those of Achen; their habits are much the same in make, but not so elegant: they are very zealous Mahometans, and in their customs and ways of living differ little from the inhabitants of Achen.

Lingen Island is situated about 60 miles north-east of Jamby, and about the same distance to the south-east as Johore. It is 50 miles in length, and 10 in breadth. The interior part of it is very mountainous, but the next the sea lies low, and is very fertile. It produces pepper and canes, and in some parts of it are great numbers of porcupines.

Banca island is very large, being at least 150 miles in length, and about 20 in breadth. The natives, like most of the Malaysians, are treacherous, and very inhospitable to such strangers as unfortunately happen to be shipwrecked on the coast. At the mouth of the streights of Banca is Lucipara, a small island, but so barren that it has but few inhabitants, and only produces a small quantity of pepper.

There are several other small islands belonging to Sumatra, some of which are uninhabited, and the rest is insignificant as not to merit the least attention.

CHAP. XXIX.

11. The Island of CEYLON.

CEYLON lies between five deg. 30 min. and 10 deg. 16 min. north lat. and between 79 deg. 40 min. and 83 deg. 45 min. east, at the distance of about 190 miles from Cape Comorin, on the Continent of India. This island was well known to the ancients, and described by Ptolemy under the name of Taprobane. It is about 900 miles in circumference, being about 300 in length, and about 140 in breadth. The Dutch call their Fort at Jaffnapatan, Ham's-Heel, from fancying that the whole island in form resembles a Westphalia ham.

This is certainly one of the most pleasant and fruitful islands in all the Indies, and the air is much more temperate than could be expected from its vicinity to the Line. The mountainous parts are woody, but the plains exceedingly fertile; springs, meandering streams, and rivers water the whole, but the latter in general are so rocky, as not to be navigable. The principal river rises in Adam's Peak, is called Mavillagonga, washes the city of Candy, and discharges itself into the ocean at Trinquemale. The variation of the seasons, and the winds which occasion the monsoons, are much the same on this coast as on the coast of India. The northern corner of this island is the most unfertile, on account of its deficiency with respect to rivers, rivulets, springs, &c. and not enjoying any refreshing showers for many years: but the other parts are amazingly fertile, being plentifully supplied with water, and enjoying periodical rains, which always proceed from the south-

ward, but are prevented from reaching the northern district by a chain of very high mountains.

Here are plenty of oxen, which in general are used instead of horses; but they are of a peculiar nature, having bunches on their backs like camels. The island, however, abounds in horses and elephants, but they are only used by the king and his favourites.

Ceylon produces all the fruits that are known in India, either on the continent or in the islands; hence it is called *The Garden of the East*, and *Paradise of the Indies*; grapes in particular are found in perfection during nine months of the year. It produces besides, plenty of ginger, pepper, sugar, mulberries, pomegranatum, calabash, cotton, and areka trees; figs, originally planted by the Portuguese, long pepper, indians, various sorts of mangos, onions, garlic, and other European roots; but above all, cinnamon.

There are various sorts of cinnamon trees, but the peculiar to Ceylon are the best. In a very dry soil they are fit to be stripped of their bark in two or three years; if the soil is a moist white sand, five years are required; but in a slimy wet earth they are eight or nine years before they become ripe. Those that happen to grow in the shade do not yield so fine a flavour as those that are entirely exposed to the sun. We are told in the Philosophical Transactions, that the cinnamon is "rather of a bitterish taste, somewhat of a pungent, and smells like camphire: for by the heat of the sun the camphire is rendered so thin and volatile, that it rises up."

It is an erroneous supposition, that cardanum grows only in the kingdom of Cananor, as great quantities of it are found in Ceylon. The natives procure it by burning the herbs after the rainy season, when the cardanum is produced from the ashes, all that is purchased

" When wise Ulysses, from his native coast
 " Long kept by wars, and long by tempests to't;
 " Arriv'd at last, poor, old, disguis'd, alone,
 " To all his friends, and e'en his queen unknown;
 " Chang'd as he was, with age, and toil, and cares,
 " Furrow'd his rev'rend face, and white his hairs,
 " In his own place forc'd to alk his bread,
 " Scorn'd by those slaves his former bounty fed,
 " Forget of all his own domestic crew,
 " The faithful dog alone his rightful master knew.
 " Unfed, unhous'd, neglected, on the clay,
 " Like an old servant, now cashier'd, he lay;
 " Touch'd with repentment of ungrateful man,
 " And longing to behold his ancient lord again;
 " Him, when he saw, he rofe, and crawl'd to meet,
 " 'Twas all he cou'd, and fawn'd, and kiss'd his feet
 " Seiz'd with dumb joy, then falling by his side,
 " Own'd his returning lord, look'd up, and dy'd."

Ants are innumerable, and throw up prodigious large hills, four or five feet in height and two or three in diameter; these they arch in an admirable manner, make so strong that it is difficult to destroy them with a pick-axe, and fill with all kinds of grain for their winter subsistence. What an useful lesson does this pro-

dent and indutrious little insect afford to the indolent and improvident!

"O! thou sluggard, tell me why the ant,
Midst summer's plenty, thinks of winter's want;
By constant journeys careful to prepare
Her stores, and to bring home the corny ear?
By what instructions does she bite the grain,
Left hid in earth, and taking root again,
It might elude the foresight of her care?
Distinct in all th' insect's deeds appear
The marks of thought, contrivance, hope, and
fear."

PRIOR'S SOLOMON.

Of the bees, which swarm here, one species builds the combs on the boughs of trees. When the inhabitants would take the honey, they hold lighted torches under the trees, which affects the little animals in such a manner that they fall down dead; the comb is then taken, and the bees themselves gathered up and boiled for food.

Serpents and leaches are very numerous, and consequently very dangerous, as the natives go bare-legged; but as much as possible to prevent them from biting, they rub their legs and feet with a composition of aloe, salt, and lemon juice.

The king only is permitted to keep turkeys, geese, ducks, and pigeons; his subjects are, however, allowed the use of all other fowls, wild and tame. Here are many wild peacocks, and green parrots; but partridges, woodcocks, wood-doves, snipes, sparrows, &c. are not so plenty. The most singular bird, however, is one entirely black, called carlos; it has a large ugly head, a long bill, short legs; never lights upon the ground, but sits almost continually on a tree, where it quacks like a duck.

Sea and fresh water fish are very plentiful; the porcupines or sea hogs are amphibious, and often ramble a considerable way up the country to browse among the corn, or eat herbs. Several kinds of fish are appropriated solely to the use of the king; and it is death by the law for any person to catch them but for his use.

Though Ceylon abounds with mines of gold, silver, and other metals, none are permitted to be worked, but those of iron; and such as produce precious stones are all monopolized by the sovereign. The cat's-eye, which has a variety of fine colours, and is no polishing, is the favourite gem; though their rubies, sapphires, topazes, hyacinths, turquoises, &c. are some of the finest in the universe. The mountains likewise produce crystal, green, white, and red; brimstone, salt-petre, &c.

The inhabitants of Ceylon are composed of Dutch, who possess and command the sea coast, where are likewise many Portuguese, Moors, Malabars, and a mongrel breed of all four; but the natives, who reside in the inland parts are called Chingulays or Cingalates. These are of two classes, the Chingulays, properly so called, and who are rather a civilized people; and the Vaddans who live in the woods, and are quite wild. The first are well made, have regular features, are very active and ingenious, hardy, frugal, temperate, and neat; but to balance their good qualities, they are talkative, yet grave; crafty, yet courteous; and treacherous, though compliant. The latter live without civil government; are excellent archers, and their principal business is to kill and devour men. When they have expended or spent their arrows, and want new ones made, they go towards the house of a smith in the night, and hang up a quantity of venison, with a skin fashioned into the form and shape of the arrow's point they want, by way of pattern; if the smith makes the arrows as they would have them, and leaves them in lieu of the venison, they reward him with more deer's flesh; but if he neglects them, they are sure to do him a mischief, which proves that they profess integrity and gratitude as well as a spirit of resentment and malice. That they are provident, is likewise evident, from their singular method of preserving flesh against a time of scarcity, which is by rubbing the inside of a hollow tree with a great quantity of honey, filling it with flesh, and closing

up the aperture with clay, which preserves it as effectually as if it was salted. They love to live under trees by the sides of rivers, where they fortify themselves against the attacks of wild beasts with boughs.

The habitations of the Chingulays, or more civilized natives of Ceylon, are low, built with sticks, or canes daubed over with clay, and covered with thatch. They have no chimnies, yet would willingly white wash their houses often, but this they dare not do, as the use of white wash is one of the king's peculiar privileges; and it is death by the law to intrude upon any of his prerogatives, however absurd or repugnant to public utility.

Some of the ancient pagodas are tolerably handsome, and resemble those of the continent of India; but such as are of a more modern date are despicable structures; which evinces that whatever little taste for architecture they ever possessed, has declined in Ceylon as well as many other places. Besides the idols in their temples, they have images of their own peculiar deities, in little chapels, built in their yards or inclosures, before whom they strew flowers, and light candles, whenever they go to pay their devotions.

With respect to their manners and customs they sit cross-legged on the floor, which is usually matted. Cane beds and stools, and a few china plates, brazen and earthen vessels for dressing food, or to serve as lamps, are the whole of their furniture. The men undress themselves and sleep between two mats; the women and children lie upon the floor on a single mat, but keep their cloaths on. But what is the most extraordinary in so warm a climate, they keep a fire burning all night.

The Chingulays eat but little flesh through inclination; beef they are prohibited from touching, and even fowls they rather abstain from. They use spoons and ladles, but neither knives or forks. The husband sits down to meals alone, the wife being obliged to wait upon him with all imaginable obsequiousness; and when he has done, she pretumes to sit down with her children. Like some other Asiatics, they do not touch the vessel they drink out of with their lips, but hold it at a distance, and pour the liquor into their mouths. Old people let their beards grow long, and wear a cap like a mitre; but with respect to the people in general, they wear a waistcoat either of blue or white callico, and another piece of callico about the middle, tied round with a sash. In the latter they wear their ornamental weapons, such as a hanger, with an enamelled hilt, and scabbard finely embossed. The people are obliged to go bare-footed, because none but the king is allowed to wear shoes and stockings. The women grease their hair with oil of cocoa nuts, and comb it down behind; they wear a flowered waistcoat, and callico apron, and adorn themselves with pendants in their ears, bracelets upon their arms, necklaces about their necks, rings on their toes and fingers, and a girdle of silver wire; and upon a visit, a silk hood is added to the rest of the dress.

The Cingulays are divided into five classes, viz.

1. The hounders or nobility.
2. Artists and mechanics.
3. Handicraftsmen of a lower order.
4. Slaves.
5. Beggars.

The Chingulays, in general, are so addicted to the use both of betel and tobacco, that they even smoke and chew in the night time, and when they are perfectly intoxicated, fall a sleeping till they drop a sleep; a custom they are taught from their infancy.

Previous to marriage, the man sends a friend to purchase the woman's cloaths, which she freely sells for a stipulated sum. In the evening he carries them to her, sleeps with her all night, and in the morning appoints the day of marriage; on which he provides an entertainment of two courses, for the friends of both parties. The feast is held at the bride's house, when the young couple eat out of the same dish, tie their thumbs together, sleep together that night, and on the ensuing morning depart for the bridegroom's habitation.

The meaning of making a purchase of the bride's cloaths is, that she and her friends may be satisfied with respect to the man's circumstances, as she always

as much for them as she thinks it is requisite that a young couple should possess on their first entering upon the world, and becoming liable to the expenses incurred by supporting a young family. Thus, what at first appears to be a ridiculous custom, is, in reality, a very prudent maxim.

"Let reason teach what fashion vain would hide,
"That hymen's bands by prudence should be ty'd;
"Venus in vain the wedded pair would crown,
"If angry fortune on their union frown;
"Soon will the flattering dream of bliss be o'er,
"And cloy'd imagination cheat no more,
"Then waking to the sense of lasting pain,
"With mutual tears the nuptial couch they stain;
"And that fond love, which should afford relief,
"Does but increase the anguish of their grief;
"While both could' easier their own sorrows bear
"Than the sad knowledge of each other's care."

They are permitted to part from each other whenever they please; but if there are any children, the man is obliged to maintain the boys, and the woman the girls: and they are so fond of availing themselves of this law, that some have been known to change a dozen times before they have entirely suited their inclinations. The profession of a midwife is unknown, as the women in general are both qualified and willing to assist each other when occasion requires.

In the same manner as confabulous with us charge any person indifferently to aid them in the execution of their duty, in the king's name, so all the male Chingalasses are allowed to command those who are within hearing, to assist them upon any emergency; but the women are not permitted to mention the king's name, under the severe penalty of having their tongues cut out.

The criminals in Ceylon are frequently impaled alive, others have stakes driven through their bodies, some are hung upon trees, and many are worried by dogs, who are so accustomed to the horrid butchery, that on the days appointed for the death of criminals, they, by certain tokens, run to the place of execution. But the most remarkable criminal punishment is by the king himself, who rides an elephant trained up on purpose; the beast tramples the unhappy wretch to death, and tears him limb from limb.

Other modes of punishing are by fines and imprisonment, at the discretion of the judges. When the fine is decreed, the officers seize the culprit wherever they meet him, strip him naked, his cloaths going as part of payment, and oblige him to carry a large stone, the weight being daily increased by the addition of others that are smaller, till the money is either paid or remitted.

A creditor will sometimes go to the house of his debtor, and very gravely affirm, that if he does not discharge the debt he owes him immediately, he will destroy himself; this so greatly terrifies the other, that he instantly mutters all the money he can, even sells his wife and children not to be deficient, and pays the sum demanded. This is owing to a law, which specifies that if any man destroys himself on account of a debt not being discharged, that the debtor shall immediately pay the money to the surviving relations, and forfeit his own life, unless he is able to redeem it by the payment of a very large sum to the king. And such hath been the revengeful disposition of some, that they have put an end to their own existence in order to overwhelm others, and thus wickedly gratified their malice at the expence of their lives.

— "Pleasure and revenge

"Have ears more deaf than adders, to the voice

"Of any true decision."

SHAKESPEARE.

A woman must not be beaten without permission from the king, so that they may thank his majesty for all the blows they get. But they may be made to carry heavy baskets of sand upon their heads as long as the punisher pleases, which is much more dreadful to them than a heavy drubbing. The circumstances of the children depend upon those of the mother; for if the mother is

a free woman, they are free, but if she is a slave, they are always vassals. They have two modes of deciding controversies, the one is by imprecating curses to fall upon them, if they do not speak the truth; and by the other both parties are obliged to put their fingers into boiling oil, when the person who can bear the pain the longest, and with the least appearance of being affected, is deemed innocent. They have, however, methods of evading both these laws, the first by using ambiguous expressions, and the latter by certain preparations, which prevent the oil from doing them any injury.

The Chingulays acknowledge one all powerful being, think that he created all things, and imagine that their deities of the second and third order are subordinate to him, and act as his agents. Among those of the second order, Buddow is the most particularly revered, as they say he was the mediator between God and man. The priests of Buddow are so much respected that they are not cognizable by the law, and even if they attempt the life of the king he dares not punish them; but like man, other Indians, the Chingulays worship both God and the devil; the first they think they ought in gratitude to pay adoration to, for the innumerable blessings he bestows upon them; and the latter they worship, that he should do them no mischief; for they fancy that whoever can put him in a good humour, is secure from receiving any harm of him. Another of their favorite deities is the *tooth of a monkey*. The original tooth, when the Portuguese were in possession of Ceylon, was, by some means, stolen from the priests, who had the care of it; this occasioned a deal of disturbance, and put the whole island into a terrible consternation; the priests were highly blamed for not being careful of so precious a deity; and the only consolation of the people was to think their lost favourite so exceedingly respectable in himself, that whoever were in possession of him could not possibly have the heart to use him ill. A cunning Portuguese, in the service of the governor, determined to take advantage of this general absurdity; and having formerly seen the *monkey's tooth*, whose loss was so greatly lamented, he procured another exactly like it, and carrying it to the priests, they were so mightily pleased to see their deity again, that they rewarded him with what amounted to above the value of 10,000 pounds, with which he retired to his own country, and lived like a gentleman, frequently saying, with great jocularity, "That as the people of Ceylon adored a *monkey's tooth*, without having ever received any benefit from it, he certainly had a right to respect it, having been so very much obliged to it." And in all companies his constant toast was the *monkey's tooth*.

The principal festival of the Chingulays is observed in honour of the new moon, in the month of July, when a priest goes in procession with a garland of flowers; to which the people present their offerings. After they have sufficiently testified their respects for it, he mounts upon an elephant, and being preceded by about 50 other elephants, he rides about with the stick upon which the garland of flowers is fixed, placed upon one shoulder. All the elephants are finely caparisoned, have collars with bells, deice ling from them, and are attended by drummers, trumpeters, pipers, dancers, &c. All tradesmen, who have any connection with the temple, or its priests, walk three in a row, holding each others hands, and have music and dancing between each company. The high priest follows, mounted upon an elephant, with a person sitting behind him holding an umbrella over his head; and two other priests mounted upon elephants succeed him. These three are the representatives of three of the principal deities. The women cooks follow with fans in their hands, and many ladies richly dressed then appear hand in hand, and three in a row; troops close the procession; the houses are adorned with streamers, and illuminated with lamps at night. This ceremony was attempted to be abolished in 1664, but a tumult caused a rebellion, so that the kings of Ceylon are obliged to let it continue.

Inferiors salute their superiors by bowing their bodies and extending their arms with the palms of their hands upwards; but the great only extend one hand, and not the head. The salutation of the women is by clapping

their hands together, and then carrying them so closed to their foreheads.

The begging class of Chingulays are mountebanks in their way; the men beat a drum, the women dance, and both shew a variety of whimsical tricks. They beg or rather amuse people for their bread in great companies; they are prohibited by law from touching the waters in wells or springs, and must use none but what is procured from rivers or ditches. If a nobleman or gentleman commits high treason, he is put to death, and his wives and daughters are delivered to some of these beggars, which is looked upon in so disgraceful a light, that they frequently destroy themselves to avoid any connections with persons esteemed so despicable.

In Ceylon, Dutch, Portuguese, and the native Cinghian languages are spoken, besides a learned language known only to the king and the priests. Their only paper is the leaf of the talipot tree; but the method of teaching children to write is here very singular, as they instruct them by writing with sticks in the sand and soft clay of the roads and streets.

The commerce is as follows,

Exports.	Imports.
Cardamum	Velvets
Jaggory	Silks
Oil	China
Black lead	Red caps
Turmeric	Spices
Betel nuts	Opium
Musk	China roots
Salt	Sandal wood
Rice	Lead
Wax	Copper
Pepper	Tin
Coral	Looking-glasses
Amber	Calicoes
Pearls, &c.	Bottles
	Camphire, &c.

The principal part of the native employ themselves in agriculture. They tread the ground, or rather mud, in which they sow rice, with buffaloes; but before they put the rice into it they soak it in water till blades begin to sprout. They embark their wet marshy lands, in order to have foot-paths. When the rice is about six inches in height, they weed and transplant it. After reaping, the women gather and put it into a pit, where it is thrashed, or rather trod by buffaloes.

The Portuguese landed in Ceylon, in 1505, and about 12 years after they established factories there; the reigning king permitting them to build forts; and upon his demise, he declared the king of Portugal his heir; but in process of time the Portuguese behaving with great cruelty and arrogance, the young king of Candy invited in the Dutch, in 1639, who after a tedious war, at length, in the year 1655, subdued the Portuguese, and became masters of the coast and trade. The king, their ally, they drove into the mountains, and with their usual gratitude made him their tributary. The Dutch have in subsequent years committed many cruelties, and the natives frequently retaliate by making excursions among them, or murdering all they meet with at a distance from the forts.

The island was formerly divided into nine monarchies, but at present it is under the dominion of one king, whose court is kept in the center of the island, at a place called Digligy-Neur; the palace is but meanly built, though the gates are large, flatly, and finely carved, and the window frames made of ebony, and inlaid with silver; his elephants, troops, and spies are numerous, and his concubines many. The guards are

commanded by Dutch and Portuguese negro officers. He assumes great dignity, and demands much respect, which his subjects readily pay him, as they imagine that all their kings are immediately upon their demise turned into gods. He expects that Christians should salute him kneeling and uncovered, but requires nothing more of them. His title is emperor of Ceylon, king of Candy, prince of Onva and the four Corles, great Duke of the seven Corles, marquis of Duranura, lord of the sea-ports and fisheries of pearls and precious stones, lord of the golden sun, &c. &c. &c. His revenue consists in the gifts and offerings of his subjects; his palaces are built upon almost inaccessible places for the greater security; no bridges are permitted to be erected over rivers or streams, or good roads to be made, to render the country as impassable as possible. None are allowed to approach his palace without a passport stamped on clay. The troops are hereditary, and carry as weapons, swords, guns, pikes, bows, arrows, &c. They are subtle, but not courageous, and will not engage an enemy but by surprise, and when there is some manifest advantage in their own favour. It is so difficult to penetrate into the inland parts, and all the palaces are so well guarded, that even the Dutch themselves are unacquainted with the greatest part of the island. The chief city, Candy, has nothing remarkable respecting it but its situation, being naturally fortified by the surrounding rocks; having formerly been burnt several times by the Portuguese, and the court being removed to Digligy-Neur, it retains very little of its former consequence. The most remarkable places on and about the coast are,

The island of Manaar,
Chilao, Negumbo,
Colombo, Point de Galle,
Batalo, Trinquelele,
Jaffnapatama, Patchiarapalle.

And the seven little islands of
Ourature, Caradiva,
Xho Deserts, Pongardiva,
Analativa, Nainandiva,
and Nindundiva.

Before we conclude, it is necessary to observe, that Adam's Peak, which stands to the east of Colombo, is not only the highest mountain in Ceylon, but in all India; it receives its name from a tradition of the natives, that Adam was created and buried here. It is steep and craggy, and of a conical figure; at the summit there is a smooth stone, on which appears the impression of a large human foot, which the Chingulays affirm to have been made by Adam. This occasions them to pay great adoration to it; and at the commencement of every year vast multitudes clamber up to it, notwithstanding the ascent is so difficult that iron spikes and chains have been fixed to the rocks, in order to facilitate their climbing. In another part of the mountain there is a lake, which the natives with equal gravity aver to have been made by the tears which they say Eve continued shedding, on account of the death of Abel, for 100 years successively. Such incoherencies will ignorance frame and superstition believe. Well might Bishop Stillingfleet say,

"Permit me, muse, still farther to explore,
"And turn the leaves of superstition o'er;
"Where wonders upon wonders ever grow,
"Chaos of zeal, and blindness, mirth, and woe;
"Visions of devils unto monkeys turn'd,
"That, hot from hell, roar at a finger burn'd;
"Bottles of precious tears that saints have wept,
"And breath a thousand years in phials kept."

CHAP. XXX.

12. The MALDIVIA ISLANDS.

THESE islands are situated about 500 miles from Ceylon, and reach from 4 deg. south lat. to 8 deg. north lat. They extend about 600 miles in length, and are upwards of 100 in the broadest part. They are said to be upwards of 1000 in number; but many of them are only large hillocks of sand, and, from the barrenness of the soil, are entirely uninhabited. The whole country is divided into 13 provinces, called Atollons, each of which contains many small islands, and is of a circular form, about 100 miles in circumference. These provinces all lie in a line, and are separated by channels, four of which are navigable for large ships, but are very dangerous, on account of the amazing rocks, that break the force of the sea, and raise prodigious surges. The currents run east and west alternately six months, but the time of the change is uncertain; and sometimes they shift from north to south. At the bottom of these channels is found a substance like white coral, which, when boiled in cocoa-water, greatly resembles sugar.

These islands lie so near the equinoctial on both sides, that the climate is exceeding sultry; the nights, however, are tolerably cool, and produce heavy dews that are refreshing to the trees and vegetables. Their winter commences in April, and continues till October, during which they have perpetual rains and strong westerly winds, but they never have any frost. The summer begins in October, and continues six months, during which time the winds are easterly, and there not being any rain, the heat is so excessive as scarce to be borne.

The Maldivas are in general very fertile; and in particular produce great quantities of millet, and another grain much like it, of both which they have two harvests every year. They have also several kinds of roots that serve for food, particularly a sort of bread-fruit, called Nellpou, which grows wild, and in great abundance. The woods produce excellent fruits, as coconuts, citrons, pomegranates, and Indian figs. Their only animals for use are sheep and buffaloes, except a few cows or bulls that belong to the king, and are imported from the continent; but these are only used at particular festivals. They have little domestic poultry, but are well supplied with prodigious quantities of wild fowl that are caught in the woods and sold at a very low price. They have also plenty of wild pigeons, ducks, rails, and birds resembling sparrow-hawks. The sea produces most kinds of fish, great quantities of which are exported from hence to Sumatra. Among the fish is one called a *serrie*, the shells of which are used in most parts of the Indies instead of coin; and these are the same as those known in England by the name of black-amoor's teeth.

The only poisonous animals here are snakes, of which there is a very dangerous sort that frequents the borders of the sea; but the inhabitants are greatly pestered with rats, dormice, pismires, and other sorts of vermin, which are very destructive to their provisions, fruit, and other perishable commodities; for which reason they build their granaries on piles in the sea, at some distance from the shore; and most of the king's granaries are built in the same manner.

The inhabitants of these islands are very robust, of an olive complexion, and well featured. They are naturally ingenious, and apply themselves with great industry to various manufactures, particularly the making of silk and cotton. They are cautious and sharp in trading; and are courageous and well skilled in arms. The common people go almost naked, having only a piece of cotton fastened round their waist, except on

festival days, when they wear cotton or silk jerkins, with waistcoats, the sleeves of which reach only to the elbows: the better sort tie a piece of cloth between their legs and round the waist, next to which they have a piece of blue or red cotton cloth that reaches to the knees, and to that is joined a large piece of cotton or silk reaching to their ancles, and girded with a square handkerchief embroidered with gold or silver; and the whole is secured by a large silk girdle fringed, the ends of which hang down before; and within this girdle, on the left side, they keep their money and betel, and on the right side a knife. They set a great value on this instrument, from its being their only weapon; for none but the king's officers and soldiers are permitted to wear any other. The better sort wear turbans on their heads made of silk richly ornamented, but those of the former sort are made of cotton, and only ornamented with various coloured ribbons.

The women are fairer than the men, and in general of a very agreeable disposition. They wear a coat of cotton or silk that reaches from the waist to the ancles, over which they have a long robe of taffety, or fine cotton, that extends from the shoulders to the feet, and is fastened round the neck by two gilt buttons. Their hair is black, which is esteemed a great ornament; and to obtain this they keep their daughters heads shaved till they are eight or nine years of age, leaving only a little hair on the forehead to distinguish them from the boys. They wash their heads and hair in water to make it thick and long, and let it hang loose that the air may dry it, after which they perfume it with an odiferous oil. When this is done, they stroke all the hair backwards from the forehead, and tie it behind in a knot, to which they add a large lock of man's hair; and the whole is curiously ornamented with a variety of flowers.

The houses of the common people are built of cocoa wood, and covered with leaves sewed one within another; but the better sort have their houses built of stone, which is taken from under the flats and rocks in the following manner: among other trees in this island is one called candou, which is exceeding soft, and when dry and sawed into planks, is much lighter than cork: the natives, who are excellent swimmers, dive under water, and having fixed upon a stone fit for their purpose, they fasten a strong rope to it: after this they take a plank of the candou wood, which, having a hole bored in it is put on the rope, and forced down quite to the stone: they then run on a number of other boards till the light wood rises up to the top, dragging the stone along with it.—By this contrivance the natives got up the cannon and anchors of a French ship that was cast away here in the beginning of the last century.

The Maldivians are in general a very polite people, particularly those on the island of Male, but they are very libidinous, and fornication is not considered as any crime; neither must any person offer insult to a woman that has been guilty of misconduct previous to marriage. Every man is permitted to have three wives if he can maintain them, but not more. The girls are marriageable at eight years of age, when they wear an additional covering on their necks: the boys go naked till seven, when they are circumcised, and wear the usual dress of the country.

They are very abstemious in their diet, their principal food consisting of roots made into meal, and baked; particularly those called nellpou and elar, the latter of which they dress several ways: they also make a porridge of milk, cocoa, honey, and bread, which they esteem an excellent dish; and their common drink is

water.

water. They sit cross-legged at their meals, in the same manner as in other eastern countries: the floor on which they sit is covered with a fine mat, and, instead of table cloths, they use banana leaves. Their dishes are chiefly of china, all vessels of gold or silver being prohibited by law: they are made round, with a cover, over which is a piece of silk to keep out the ants. They take up their victuals with their fingers, and in so careful a manner as not to let any fall; and if they have occasion to spit, they rise from the table and walk out. They do not drink till they have finished their meal, for they consider that as a mark of rudeness; and they are very cautious of eating in the presence of strangers. They have no set meals, but eat when the appetite serves, and all their provisions are dressed by the women; for if a man was to be seen executing that business, he would be treated with the greatest contempt.

They are naturally very cleanly, and when they rise in the morning, they immediately wash themselves, rub their eyes with oil, and black their eyebrows. They are also very careful in washing and cleaning their teeth, that they may the better receive the stain of the betel and areka, which is red, the colour they are particularly fond of. They constantly keep betel about them, and mutually present it to each other upon occasional salutations.

Though they are all Mahometans, yet they preserve many Pagan customs; for when crossed at sea, they pray to the king of the winds; and in every island there is a place where those who have escaped danger make offerings to him of little vessels made for the purpose, in which they put fragrant woods, flowers, and other perfumes, and then turn the vessel adrift to the mercy of the waves. Such are their superstitious notions of this airy king, that they dare not spit to the windward for fear of offending him; and all their vessels being devoted to him, they are kept equally clean with their mosques. They impute crosses, sickness, and death to the devil; and in a certain place make him offerings of flowers and banquets in order to pacify him.

Their mosques are very neat buildings made of stone well-cemented, each of which is situated in the center of a square, and round it they bury their dead. The mosque has three doors, each ascended by a flight of steps: the walls within are wainscoted, and the ceiling is of wood beautifully variegated. The floor is of polished stone, covered with mats and tapestry; and the ceiling and wainscoting are firmly joined without either nails or pegs.

Each mosque has its priest, who, besides the public duties of his office, teaches the children to read and write the Maldivian language, which is a radical tongue; he also instructs them in the Arabic language, and is rewarded for these services by the parents.

Those who are very religious go to their mosque five times a day; and before they enter it, they wash their feet, hands, ears, eyes, and mouth; nor will they neglect doing this on any occasion whatever. Those who do not chuse to go to the mosque may say their prayers at home; but if they are known to omit doing one or the other, they are treated with the greatest contempt, as no person will either eat or converse with them.

They keep their sabbath on the Friday, which is celebrated with great festivity; and the same is observed on the day of every new moon. They have several other festivals in the course of the year, the most distinguished of which is one called Maulude, and is held in the month of October, on the night in which Mahomet died. On this occasion a large wooden house, or hall, is erected on a particular part of the island, the inside of which is lined with the richest tapestry. In the center of the hall is a table covered with various sorts of provisions, and round it are hung a prodigious number of lamps, the smoke of which gives a most fragrant scent. The people assemble about eight o'clock in the evening, and are placed, by proper officers appointed for that purpose, according to their respective stations. The priests and other ecclesiastics, sing till midnight, when the whole assembly fall prostrate on the ground, in which posture they continue till the head priest rises, when the rest follow his example. The people are then served

with betel and drink; and when the service is entirely over, each takes a part of the provisions on the table, which they carry home, and preserve as a sacred relic.

With respect to their marriage ceremonies, when two persons intend entering into that state, the man gives information of his design to the pandiara, or maybe, who asks him if he is willing to have the woman proposed; on his answering in the affirmative, the pandiara questions the parents as to their consent; if they approve of it the woman is brought, and the parties are married in the presence of their friends and relations. After the ceremony is over, the woman is conducted to her husband's house, where she is visited by her friends, and a grand entertainment is provided on the occasion. The bridegroom makes presents to the king, and the bride equally compliments the queen. The man does not receive any dowry with his wife, and he is not only obliged to pay the expence of the nuptial ceremony, and to maintain her, but he must likewise settle a jointure upon her, though, if she thinks proper, he may relinquish it after marriage. A woman cannot part from her husband without his consent, though a man may divorce his wife; but if she does not assent to the separation, she may demand her jointure; yet this is seldom practised, it being considered as an act of the meanest nature.

When any one dies, the corpse is washed by a person of the same sex, of which there are several in each island appointed for that purpose. After this is done, it is wrapped up in cotton, with the right hand placed on the ear, and the left on the thigh. It is then laid on the right side in a coffin of candou wood, and carried to the place of interment by six relations or friends, and followed by the neighbours, who attend without being invited. The grave is covered with a large piece of silk or cotton, which, after the interment, becomes the property of the priest. The corpse is laid in the grave with the face towards Mahomet's tomb; and after it is deposited, the grave is filled up with white sand sprinkled with water. In the procession both to and from the grave, the relations scatter shells for the benefit of the poor, and give pieces of gold and silver to the priest, in proportion to the circumstances of the deceased. The priest sings continually during the ceremony, and when the whole is over, the relations invite the company to a feast. They inclose their graves with wooden rails, for they consider it as a sin for any person to walk over them; and they pay such respect to the bones of the dead, that no persons dare touch them, not even the priests themselves.

They make little difference in their habit on these occasions: the mourners only go bareheaded to the grave, and continue so for a few days after the interment.

When a person dies at sea, the body, after being washed, is put into a coffin, with a written paper mentioning his religion, and requesting those who may meet with the corpse to give it decent interment. They then sing over it, and, after having completed their ceremonies, they place it on a plank of candou wood, and commit it to the waves.

The king resides at Male, the most considerable of the Maldivian islands. It is situated in the center of the reef, and is about five miles in circumference. The palace is built of stone, and divided into several courts and apartments, but it is only one story high, and the architecture very insignificant; however, it is elegantly furnished within, and surrounded with gardens, in which are fountains and cisterns of water. The portal is built like a square tower, and on festival days the musicians sing and play upon the top of it. The ground-floors of the respective apartments are raised three feet, to avoid the ants, and are covered with party-coloured mats, on which are painted several characters and figures. The ceiling and walls are covered with silk tapestry, fringed and flowered with gold. The king's beds are hung like hammocks between two pillars ornamented with gold; and when he lies down he is rocked to sleep by his attendants.

The king's usual dress consists of a coat made of fine white cloth or cotton, with a white and blue edging, fastened

fastened with buttons of solid gold: under this is a piece of red embroidered tapestry that reaches down to his heels, and is fastened with a large silk girdle fringed, and a great gold chain before, with a jocket formed of the most precious stones. He wears a scarlet cap on his head, which is a colour so esteemed that no other person dare presume to use it. This cap is laced with gold, and on the top of it is a large gold button with a precious stone. The grandees and soldiers wear long hair, but the king's head is shaved once a week: he goes bare-legged, but wears sandals of gilt copper, which must not be worn by any other persons except those of the royal family.

When he goes abroad, his dignity is particularly distinguished by a white umbrella, which no other persons, except strangers, are permitted to use. He has three pages near his person, one of whom carries his fan, another his sword and buckler, and a third a box of betel and areka, which he almost constantly chews. He goes to the mosque on Fridays (the sabbath of the Maldives) in great pomp, his guards dancing, and striking their swords on each others targets to the sound of music; and is attended on his return by the principal people of the island. As there are not any beasts of burthen, he either walks, or is carried in a chair by slaves.

When the queen goes abroad, all the women in their respective districts meet her with flowers, fruits, &c. She is attended by a great number of female slaves, some of whom go before to give notice to the men to keep out of the way; and four ladies carry a veil of white silk over her head that reaches to the ground. She and her ladies frequently bathe in the sea for their pleasure, and for the convenience of which they have a place on shore close to the water, which is inclosed, and the top of it covered with white cotton. The only light in the chambers of the queen, or those of the ladies of quality, is what arises from lamps, which are kept continually burning; it being the custom of the country never to admit day-light. The drawing-room, or that part where they usually retire, is blocked up with four or five rows of tapestry, the interwork of which none must lift up till they have coughed, and told their names.

The principal part of the nobility and gentry live in the north parts of this island for the convenience of being near the court: and so much is this division esteemed, that when the king banishes a criminal, he is thought to be sufficiently punished by being sent to the south.

The king's guards consist of 600, who are commanded by his grandees; and he has considerable magazines of arms, cannon, and several sorts of ammunition. His revenue consists chiefly of a number of islands appropriated to the crown, with certain taxes on the various productions of others; in the money paid to purchase titles and offices, and for licences to wear fine cloaths. Besides these, he has a claim to all goods imported by shipping; for when a vessel arrives, the king is acquainted with its contents, out of which he takes what he thinks proper at a low price, and obliges his subjects to purchase them of him again at what sum he pleases to fix, by way of exchange for such commodities as best suit him. All the ambergris found in this country, (which produces more than any other part of the Indies) is also the property of the king; and so narrowly is it watched, that whoever is detected in converting it to his own use, is punished with the loss of his right hand.

The government here is an absolute monarchy, for

every thing depends on the king's pleasure. Each atollon, or province, has a naybe, or governor, who is both a priest and a doctor of the law. He not only presides over the inferior priests, and is vested with the management of all religious affairs, but he is likewise entrusted with the administration of justice, both in civil and criminal cases. They are in fact so many judges, and make four circuits every year throughout their jurisdiction: but they have a superior called the pandiarc, who resides in the isle of Male, and is not only the supreme judge of all causes, but also the head of the church. He receives appeals from the governor of each province, but does not pass sentence without consulting several learned doctors; and from him appeals are carried to the king, who refers the matter to six of his privy council. The pandiarc makes a circuit once a year through the island of Male, (as every governor does in his respective province) and condemns all to be scourged that cannot say their creed and prayers in the Arabic tongue, and confine them into the Maldivian. At this time the women must not appear in the street unveiled, on pain of having their hair cut off, and their heads shaved.

The punishments for crimes are various: if a man is murdered, the wife cannot prosecute the criminal; but if the deceased has left any children, the judge obliges him to maintain them till they are of age, when they may either prosecute or pardon the murderer. The stealing any thing valuable is punished with the loss of a hand, and for trifling matters they are banished to two southern islands. An adulterer is punished by having her hair cut off, and those guilty of perjury pay a pecuniary mulct. Notwithstanding the law makes homicide death, yet a criminal is never condemned to die, unless it is expressly ordered by the king; in which case he sends his own soldiers to execute the sentence.

The principal articles exported from these islands are, cocoa-nuts, cowries, and tortoise-shell, the latter of which is exceeding beautiful, and not to be met with in any other place, except the Philippine Islands. The articles imported are, iron, steel, spices, china, rice, &c. all which, as before observed, are engrossed by the king, who sells them to his subjects at his own price.

Their money is silver, and of one sort only, called lorrins, each of which is about the value of 8d. It is about two inches in length, and folded, the king's name being set upon the folds in Arabic characters. They sometimes use the shells of cowries, instead of small change, 1200 of which make a lorrin; but in their own markets they frequently barter one thing for another. Their gold and silver is all imported from abroad, and is current here by weight, as in all other parts of the Indies.
